Your bull is probably the victom of an inflammatory condition of the testicles or scrotum. This trouble is of long standing, according to your letter, and should have been handled long ago. It is possible he will be ruined for breeding purposes and may have to be castrated. We could give you a line of treatment, but do not think it advisable in a case of such long standing. Our advice to you would be to get a veterinarian who is a competent man and have him make a thorough examination and find out whether the testicles are involved. It is very possible there is pus formation in this swelling that will need to be liberated and this can best be done by a competent veterinarian.

Health First

If a cow is well—if her organs of production are doing their duty—she will yield well. Time was when the cow that became sluggish and seemed to be going backward was promptly sold to the butcher.

Thousands of cow owners have found that in most cases proper treatment will save them the difference between the price of a beef cow and a vigorous milch cow.

Most dairy cow ailments are simple if the source of the trouble is reached. If the organs of production or reproduction are not doing their duty, try Kow-Kure—the medicine for run-down cows. It has worked wonders in many herds, and is especially recommended for the prevention and cure of Abortion, Barrenness, Milk Fever, Scouring, Lost Appetite, Bunches, Retained Afterbirth, etc.

Keep Kow-Kure on hand constantly. Sold in 50c. and $1.00 packages by feed dealers and druggists.

Write us for copy of our free book, "The Home Cow Doctor."

POULTRY DEPARTMENT

THIS department is edited by a competent poultryman, who will be pleased to answer questions concerning disease, poultry management, etc., when they can be answered through the department. Questions will not, however, as a rule, be answered by mail, and stamps need not, therefore, be inclosed with inquiries. Address all letters relating to poultry topics to this office.

Shade For Hens In Hot Weather.

To the Editor:—The poultry should have plenty of shade in the hot weather. About noon the hens will get out of the hot sun and remain in the shade until three or four o'clock when they will again return to the field or range and stay until time to go to roost.

The shade may be furnished in a few months if plum and cherry trees are planted about the chicken runs. The orchard is also a nice place for the hens, because out there they find many bugs and worms while scratching beneath the shade of the apple trees. I have seen the hens out in the wooded lot enjoying themselves in the heat of the day as they scratched in the leaves or grass. If the flock must remain in the poultry house to find refuge from the hot sun, the hens will simply sit around very inactive until the day gets cooler.

When the poultry must be confined to a small lot, I find it a good plan if no shade is available, to make an artificial shade. One summer I drove three foot posts into the ground, one at each corner of a parallelogram six feet wide and twelve feet long. I nailed two-by-fours to the top of these posts and covered with boards. A curtain of burlap was hung to the south side so that the sun would not shine beneath it in the mid day. Here the hens would come and scratch and dust themselves during the heated portion of the day. So I have made it a point to see that the hens have a good shade in the warm weather. It pays.

Subscriber.

Raising More Geese.

To the Editor:—Every farmer who has a good orchard or low pasture should put a poultry fence around it and raise geese. A good many farmers say they are such a bother and are around the house all the time. If you have no spare space and let them roam around, your dwelling and lawn will be ruined. Geese are the biggest pests on the farm if allowed to roam at will. They are into everything they shouldn't be and the sidewalks and porches are like a pig pen. I feel sorry for the farmer who tries to raise geese without having a place to keep them up.

Geese are the cheapest birds to raise on the farm and they are very easy to raise. Keep them on green stuff, such as grass, dandelions, lettuce and sugar beet leaves until one month before Thanksgiving. Then give them all the corn they will eat and you will have your geese in good condition, that is, a good eating goose. If you want a lot of goose oil put in fattening pen a couple of weeks earlier. Always dispose of the early hatched first and the late hatched by the holidays. Last Christmas and New Year's we had a shortage of geese and they were paying 21 and 22 cents per pound for nice geese.

I have had a few inquiries why geese do not hatch better than they generally do. Most farmers feed too heavy and fattening food during the winter. Your breeding geese should be fed only oats and potato peelings, then you will have fertile eggs. I always use chicks and get good results. I put as many as eight eggs under a chick, just according to the size of the hen. When you set your hen give her a large nest, put ground on the bottom and then fine chaff. Make the nest deep and roomy. Now, with a lead pencil put a line on every egg lengthwise, on only one side of the egg. This is so you can tell which egg you have turned. The eggs are too large for a hen to turn properly. After two or three days you should turn the eggs twice a day—morning and evening—and move the outside eggs to the center of the nest and the center eggs to the outside. Keep this up until the twenty-seventh day, then keep them set up on the point. From the twenty-second day you should moisten the eggs freely and you'll hatch them all. If some of the goslings dry up in the shell and can't come out, free them by cracking shell, dip them in a pan of fairly warm water and put back under the hen. I've had them come out nice after being in the egg thirty-two days.

When you get ready to set the hens try setting two or three at one time. Candle your eggs by the seventh or eighth day, throw out the clear ones and double up with the other hen. If you haven't any more goose eggs set them with chicken eggs. We must learn to economize even with the chicks.

Where a lot of farmers make a mistake is that they try to wean the young too soon. When a gosling gets cold it's done for. When the chilly rains come they need the hen and you must watch her closely. Better shut her up in a large box or in the barn where she must set down and warm the goslings. Many a farmer will say he hasn't time to fool around with young stock. Why don't you give them to your daughter or son to care for and let them have the profit for pin money? It comes just around Christmas time when they need a little extra money. Fred H. Thiele.

Milwaukee Co., Wisconsin.

Tells why chicks die

E. J. Reefer, poultry expert, 4484 Reefer Bldg., Kansas City, Mo., is giving away free a valuable book entitled, "White Diarrhoea and How to Cure It." This book contains scientific facts on white diarrhoea and tells how to prepare a simple home solution that cures this terrible disease over night and actually raises 98 per cent of every batch. All poultry raisers should certainly write Mr. Reefer for one of these valuable FREE books.

Get Rid of WORMS and INDIGESTION

Do you know that ninety per cent of all live stock losses are caused by Worms and Indigestion and both these conditions are preventable? Get rid of the blood-sucking worms and you will remove the chief cause of losses. Wormy animals can't thrive; the food they eat is largely wasted; they run down in condition — become easy victims to diseases. Worms eat up your high cost feed — bring on indigestion — cause heavy loss. Get rid of the worms with—

The Great Worm Destroyer SAL-VET The Great Live Stock Conditioner

The medicated salt without Antimony. Give your animals free access to it; they'll rid themselves of worms. Costs only 1-12 of a cent a day for each sheep or hog and only 1-3 of a cent a day for each horse or head of cattle. **SAL-VET** will do the work; I'll prove it or no pay.

PRICES

40 lb. pkg.	$ 2.25
100 lb. pkg.	6.00
200 lb. pkg.	9.00
300 lb. pkg.	13.00
500 lbs.	21.12

Extra discount in larger quantities.

Not less than 40 lbs. sent on this 60-day offer. 60 days' trial are based on 1 lb. of Sal-Vet for each sheep or hog and 4 lbs. for each horse or head of cattle. Dealers sell Sal-Vet at above prices but in the far West and South the prices are a little higher on account of the extra freight charges.

DON'T SEND MONEY—JUST THE COUPON

Fill in the coupon below—tell me how many head of stock you have; I'll supply you enough **SAL-VET** to last your animals 60 days. You pay the freight when it arrives; feed as directed, make a specific report at the end of 60 days. If **SAL-VET** does not do what I claim it will cost you nothing.

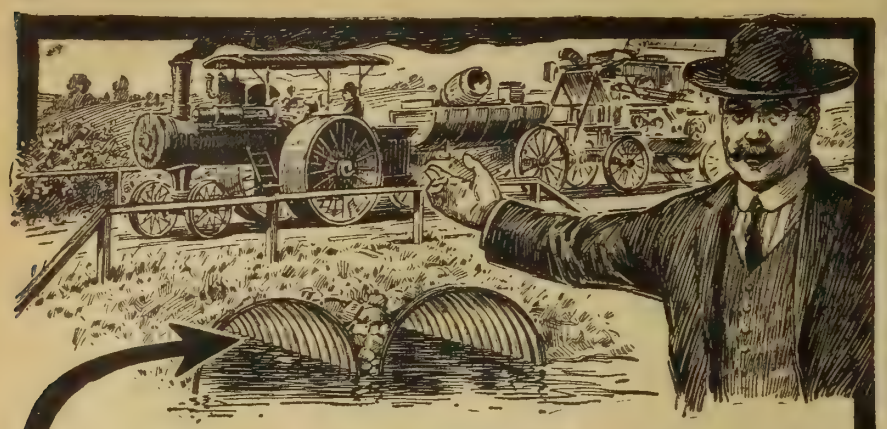
A Cream Separator with Automatic Feed.

IT IS a good deal of bother to figure out how fast th cream separator ought to be turned in order to get all the cream, or to keep close watch on the speed indicator and turn the crank at the same time. The farmer has learned this, so have the Sharples Separator Co., West Chester, Pa. Therefore, the new Sharples suction-feed separator is made to control the milk flow automatically no matter what the speed of turning. By turning fast or slow the skimming is fast or slow, but it gets all the cream either way. Other special features of the Sharples are the knee-high supply can which saves lifting and the three-piece bowl which is very easy to wash. See advertisement on page 15 and get the handsome catalog, "Velvet for Dairymen," by sending to the company named above, and mentioning this paper.—Adv.

GET IT **AMERICAN POULTRY JOURNAL** Tells everything about the fascinating and profitable poultry industry. Issued monthly; 10 cents. We want you to know how good it is and will send it 6 months for 25c. Order now A. P. J. 1472-542 S. Dearborn, Chicago, Ill. **25 CTS**



No Danger There!

THE weighty tractor, the heaviest threshing outfit—the kind of traffic that does not dare to venture across the ordinary bridge, but is compelled to go a long way round—all these can pass without risk and without loss of time over the road on which are used

"ARMCO" IRON CORRUGATED CULVERTS

In every State "Armco" Iron Culverts have been installed to take the place of dangerous bridges. Years of service have proved them safe. Thousands of installations have also been made on the road-beds of the great railway and traction lines. "Armco" (American Ingot) Iron Culverts are also economical in the long run. Being *pure* iron (never less than 99.84% pure) they resist rust and defy the forces that cause ordinary culverts to deteriorate. They are easily hauled to the job, and quickly installed.

Look for the triangle trade-mark on every section. If you do not find it, the culvert is not genuine "Armco" Iron.

ARMCO IRON CULVERT MFRS. ASSOCIATION, Cincinnati, Ohio

More About Spraying.

Spraying for the control of insects and fungoid growths injurious to trees and plants is a very large subject. All that is important to know about it cannot be condensed into a short article. Only hints can be given and the reader must think these out to their logical conclusion.

In the use of Paris green to kill insects the right proportions are one and a half pounds of the poison to one pound of fresh lime and 200 gallons of water. But note in using this that it must be kept stirred else the poison will settle, as it is heavier than water. Buy the green in the original package, guaranteed pure. In this formula the lime is used to overcome the caustic poison which might otherwise injure foliage.

For fungous troubles add to this same mixture six or eight pounds of copper sulphate or bluestone. The bluestone is always to be dissolved in water in a separate vessel and not mixed with the limewater until just before using. The bluestone is best dissolved by enclosing in a burlap sack and suspending it in the water.

Another poison largely used instead of Paris green is arsenate of lead. This has some advantages over the other. It remains in solution longer, it adheres to the foliage better and there is less danger of injury to the foliage. Two pounds of the arsenate to fifty gallons of water is the right proportion. This may be added to the Bordeaux mixture also.

A substitute for the Bordeaux is the lime-sulphur solution, and some fruit men prefer this when the trees are dormant.

This is doubtless the best treatment for scales and all sucking insects. The lime-sulphur is a commercial article and may be bought in all sized packages up to barrel size. One gallon of this to eight of water is the proper mixture, but do not apply to growing plants. Arsenate of lead may be added if a poison is desired.

Another spray much used when it is desired to destroy sucking insects is the kerosene emulsion. To make this in quantity dissolve a half pound of hard soap in a gallon of boiling water and add at once two gallons of oil. Churn with violence until it is fully mixed. When ready to use add ten gallons of water to one of this prepared solution.

White hellebore is a useful poison to control currant and cabbage worms. An ounce of the powder to three gallons of water is the formula in general use. Just as good a way is to use it dry, mixing an ounce of hellebore with five times as much flour or air-slaked lime or plaster Paris.

Some people confuse the uses of these various mixtures, but the practical man must get it clearly in mind that the Bordeaux will not kill insects. It is only to control rust, rot and scab. You must add to this the poison if you have also bugs to kill.

Be sure to get a spraying outfit adapted to your business. Much depends upon having your solutions well prepared, with no lumps which will clog in the nozzle. And have the best possible nozzle, for there are different kinds. Also you will need an extension rod to lengthen your hose and carry the spray mist well up above the tree.

Spraying is not advised for the cutworm, often so destructive in our gardens. They are best destroyed by feeding them poisoned bran. Mix in the proportion of forty pounds of wheat bran, one pound of Paris green, one quart of molasses. It is best to mix bran and poison dry and then add the sweetening. Scatter this feed in the late evening at the places where the worms are known to be working. They will eat it and it will be their last meal.

The handling of plants having woody or semi-woody stems is a fine art. Most persons break the stems or cut them with shears and plunge them into cold water. These are exactly the wrong things to do. The stems should be cut off with a sharp knife, making a clean, slanting cut. Each stem should be free of joints, since water is drawn up through the jointed stem. The stems should be placed in a deep vase filled with warm water. Finally the blooms should be set where they are out of the bright sunshine and not exposed to strong drafts. When handled in this way such flowers quickly draw up water and maintain their freshness.

Live Stock and Commercial Notes.

Gathered by Representatives of The Wisconsin Farmer.

Griswold Bros.' Scotch Short-horns and Percherons.

WE recently visited Griswold Bros., Livingston, Wis., and were surprised to find such a high-class lot of stock on their farms. Not but what they are competent to raise as good cattle and horses as anyone, but they have never made much noise about their breeding operations and we didn't know what they had. We found one of the good Short-horn herds of the state—mostly all Scotch of the most fashionable families. We saw several daughters of the renown Villager, some Cruickshank Victorias, Butterflys and several daughters of the famous Whitehall Sultan. The outstanding daughter of the latter bull is Diamond Anoka, a cow that has won the purple ribbon at several shows and a gold mine as a producer, on this farm. She is the dam of the senior herd bull, Hopeful Sultan. He is an excellent roan, very smooth and one of the best quartered bulls we have ever seen. He is by Hopeful Knight, a son of Gallant Knight bred by Colonel Harris. Another good bull in service is Cumberland King he by Royal Cumberland 2d out of Lovely Queen by Victor Archer. The young stuff on the farm by him will impress you and prove to you that he is a sire of merit. These gentlemen have a real show prospect in a white bull sired by Denmark 6th. He is a wonderful yearling and if he continues to do well he should make a creditable showing at the fall fairs. Messrs. Griswold expect to make some of the state fairs this fall and their Short-horn herd is in charge of George Clubb a feeder whom we have known for several years and a competent man with a good herd of cattle. Consistent with their cattle herd is their Percheron stud. They have a band of brood mares that we believe are second to none in the state. They have daughters of Calypso, a stallion that has sired more prize winners than any Percheron stallion that has ever headed a stud. Other mares are by Inscrit, an International winner and a stallion that was exported to Canada at a long price. The mares are sure and regular breeders. Keep this firm in mind, for they have Short-horns and Percherons that will make a reputation for them as breeders.—Adv.

Furnace Facts for Farmers.

FARMERS with the Mueller furnace in their homes say they wouldn't be without it. It saves them fuel and labor, so they say, and gets rid of the dirt and inconvenience of stoves. The health of everyone in the family is better because of the even, comfortable, smokeless heat which the Mueller furnace gives. Even though summer time is coming on, there will be many damp, chilly days when the house should be slightly heated. A small amount of fuel in a Mueller will take the chill off the house without requiring any attention after starting. A furnace, installed now, will furnish heat if needed on cold days in spring and summer and will be ready for next winter. Don't wait until next fall and have the cold weather surprise you before you are ready. The L. J. Mueller Furnace Co., 204 Reed St., Milwaukee, Wis., makes steam and hot water boilers, hot air furnaces and vapor heating systems. The Mueller pipeless furnace is especially desirable where it is not practical to tear up the walls to install pipes and flues. No flues or pipes are needed, because it heats the whole house from one central register. Write to the company named above to assist you in solding your heating problems. They will give you real, honest advice.—Adv.

The Seed for Bumper Crops.

SEED which will produce bumper crops must have two outstanding characteristics: High germination which will give a full, even stand and strong vitality which will produce large, sturdy plants. Such seed is a good investment; though the cost is greater, it is more than offset in larger yields. Northrup, King & Co., have selected seeds for both these characteristics and have marked them with three brands, Sterling, Northland and Viking. Seeds so marked are dependable—they are large, plump, fully matured and free from dirt and foreign seed. Ask your dealer for these brands. A descriptive seed catalog will be sent on request if you write to Northrup, King & Co., Seedsmen, Hennepin Ave., at First St., Minneapolis, Minn., and mention this paper. See the advertisement on page 11.—Adv.

Little's Milking Short-horns.

MR. HARVEY H. LITTLE, Evansville, Wis., has, without a doubt, one of the best herds of dual-purpose Short-horns in the state of Wisconsin. He has a large herd made up of cows that are great milkers. Mr. Little's success is due largely to the fact that he is an excellent feeder and caretaker, and should you visit his farm you will find his cattle in the very best possible condition for good service. Not only is the Little herd made up of good individuals, but they possess breeding that is most popular. A bull that did good service in this herd was Gifford Clay. He was sired by Cecil Palmer, that in turn was the sire of Belle of Glenside, the dam of Rose of Glenside, that holds the world's record for a dairy Short-horn. At a recent sale of milking Short-horns held in Ohio, and the greatest sale of the breed in years, the top females were of this Rose family and we feel confident that Mr. Little has as much or more of that breeding in his herd than any other breeder in the state. It is very seldom one will find Mr. Little with a surplus of Short-horns, there is a place for everyone he wishes to sell. Keep this good herd in mind. See page 31.—Adv.

Herds Nominated in the State Duroc Futurity.

WE are pleased to advise our readers and especially those interested in better swine, that the necessary nominations, twenty in number, for the Duroc Futurity have been received, consequently this show is guaranteed by the National Duroc Record Association and will be staged at the Wisconsin State Fair this fall. A futurity at a fair stimulates interest that can't be obtained in any other manner. It is the greatest feature of the horse and cattle classes and where swine futurities have been put on they have been a grand success. The futurity is for pigs under six months old, age to be governed by the rules of the state fair in which the futurity is held. It is a separate classification from the regular state fair premium list and the prize money is a great deal more than given by the fair board, in the open classes. A breeder can enter in both the futurity and open classes and if he is fortunate enough to get a place, his winnings are considerable. The small breeder has an equal chance with the old-time showman and we might mention the fact that at two of the futurity shows that the writer attended last year, the heaviest winners were breeders making a show for the first time. Besides the cash awards, a beautiful cup will be given by the Duroc Bulletin and also one by The Wisconsin Farmer. Every man interested in Durocs should boost this show, for by so doing he is helping his own game. Those that have made entries should pick out a few of the prospects and give them some special care, do not wait until the middle of the summer to begin fitting your pigs, this fast and forced feeding isn't good for the pigs and it is impossible to get the growth and finish to them that you can if you will grow and finish them from the start. Each of you have the same chance to get a place this fall and if you do you will be well repaid for the time spent. We follow with a list of the men that have nominated their herds and while some of them may not show it shows a disposition on their part to boost the Durog hog in this state. J. W. Thomas, North Bend; Chas. A. Peterson, Rosendale; L. F. Atwater, Bangor; Stubbs & Hyzer, West Salem; W. C. Jenkins, Bangor; Geo. V. Koehler & Sons, Hixton; Brian L. Rundell, Hammond; W. G. Bartholf, Burlington; Dennis Shea, Melvina; M. H. O'Keefe, Waunakee; J. W. Higgins, Gotham; Grant's Farm, Delavan; E. H. Parker & Son, Janesville; Fred Leonard & Sons, Jefferson; John L. Fisher, Janesville; W. C. Taylor, Bagley; Alex Knutson, Brodhead; F. R. Constance, Waupaca; McClurg Bros., Viroqua; Chas. Burt & Son, Brodhead.—Adv.

Rich Farm Land for Sale.

THE farmers of Canada are enjoying an unusual degree of prosperity. The crops are large and sell at high prices while the taxes and other expenses are low. A large amount of good farming land is still open for settlement along the Canadian Pacific railway and offers a wonderful opportunity for anyone wanting a money-making farm. This land sells for $1 to $30 an acre, with twenty years in which to pay, and is owned by the railway. If you are interested in this proposition, read the advertisement on page 12 and send for the free book describing this land of opportunity. Address J. S. Dennis, Assistant to the President, Canadian Pacific Ry., 82 Ninth Ave., Alberta, Can.—Adv.

The Use of Powder on the Farm.

ATLAS farm powder has an excellent use in clearing unproductive land of stumps and preparing it for cultivation. It blows the stumps into pieces which may be easily carried away and no experience or skill is required to use it. In these days of high-priced farm products, idle land is decidedly un-

economical and many farmers will welcome this cheap means of getting their stump land under cultivation. Atlas farm powder is also efficient in digging ditches, making tree holes and blasting hardpan subsoil. The "Better Farming book tells how to do this work. Send the coupon attached to the advertisement on page 10 and get the book. Address the Atlas Powder Co., Wilmington, Del., and kindly mention this paper.—Adv.

A Duchess Ormsby Bred Bull.

THE great seven-day and yearly records made recently by Holstein cows of the Duchess Ormsby strain have attracted the attention of the entire dairy world, and reminds one of the excitement caused when Johanna McKinley Segis made her forty-pound record. A young bull combining the breeding of both these animals is offered for sale on this page by L. Lindauer, Kaukauna, Wis. This bull is out of a daughter of the $25,000 bull, Johanna McKinley Segis, a son of the forty-pound cow, Johanna De Kol Van Beers. He is sired by Fairmont Pietje Ormsby whose three nearest dams average over thirty pounds butter in seven days. Fairmont Pietje Ormsby is out of Piebe Ormsby Duchess, a sister to the new forty-one-pound cow, Sadie Vale Concordia 4th. Piebe Ormsby Duchess is by Duchess Ormsby Piebe Burke and out of Piebe Queen, a full sister in blood to Duchess Ormsby. Fairmont Pietje Ormsby is, therefore, a very richly bred Ormsby on his dam's side. His sire, Hillside Pietje, is out of the thirty-two-pound cow, Hillside Dodo. The young bull offered for sale, therefore, has two forty-pound records, eight thirty-pound records in his pedigree and combines the blood of Johanna De Kol Van Beers, Duchess Ormsby and Hillside Dodo. If you are in the market for an exceptionally well-bred bull, send for the pedigree of this one.—Adv.

A Choice Guernsey Bull.

A CHOICELY-BRED Guernsey bull is offered for sale on this page by E. R. Whitcomb, Whitefish Bay, Wis. He is not only choicely bred, but is also an outstanding individual, well grown, well marked and backed by heavy producing blood. His dam, Dube's Pretty Duchess 2d, gave over 11,000 pounds of milk in a year and made 638 pounds of fat. She is a daughter of Two Creeks, a son of the great show cow, Select's O. K., which won grand championship at the Wisconsin State Fair several years in succession. The sire of the bull offered for sale is Glenwood's King Coral, a son of Glenwood's Stranford, whose dam made 725 pounds of fat in a year. Glenwood's King Coral is a grandson of Glenwood Boy of Haddon, that has thirty A. R. daughters and King Coral that has twenty-five A. R. daughters. The three nearest dams of this young bull average 632 pounds of fat for the year. It will be seen that he is fit to head the best of pure-bred herds. For charted pedigree and further information write to the above address.—Adv.

Get These Building Plans and Estimates.

THE Gordon-Van Tine Co., Case St., Davenport, Iowa, are large distributors of lumber, shingles, paints and hardware for building. Anyone who is expecting to build should have their illustrated catalog because they can save you money on anything from a chicken house to a barn. They will send you all materials necessary for buildings and complete plans. Whatever you have in mind in the building line, you should consult their catalog. Gordon-Van Tine Co., also have plan books and guaranteed estimates which may be had on request. If you are interested, fill in the coupon attached to the advertisement on page 12 and send to the company. You will receive a prompt reply if you mention this paper. —Adv.

Good Barn Equipment is Important.

HOW is your barn equipped? Is the stock cared for in the best way? Does the arrangement save steps and labor? These questions confront every farmer. Good farming demands labor-saving, profit-making equipment. The Mitchell Mfg. Co., 2906 Forest Home Ave., Milwaukee, Wis., have some trustworthy information on this kind of equipment—steel stalls, water bowls, stanchions, calf and bull pens, and feed trucks are included in their line. Write for the catalog of Mitchell barn equipment advertised on page 29. It will make a handy reference book for you.—Adv.

A Suggestion to Cattlemen.

CATTLEMEN should read the advertisement on page 26 of "Easy to Use" cattle instruments. The outfit includes instruments for treating milk fever, bloat, garget and several other ailments which often prove fatal to cattle. Frequently a valuable animal is lost because the veterinarian arrived too late. With these instruments a cattleman can do the work himself, before it is too late. A book on the treatment of cattle ailments will be sent upon request to G. P. Pilling & Son Co., 2318 Arch St., Philadelphia, Pa. Cattlemen should get this book.—Adv.

The KisselKar Combines High Efficiency and Low Price.

THE KisselKar is built to give the greatest efficiency possible without adding construction costs that will do no practical good. Therefore, the price of $1,050 for a KisselKar buys real service and not useless refinements. It is a wonderfully low price for a car of such high efficiency and stanch, skillful construction. The appearance of this car compares favorably with any car on the market. Write for the literature describing the great Kissel-Kar models, which you will find both interesting and instructive. Address Kissel Motor Car Co., 312 Kissel Ave., Hartford, Wis., and kindly mention this paper in your letter. See advertisement on page 8.—Adv.

Wiegands' Jerseys.

AN opportunity to obtain an exceptionally fine yearling Jersey bull is offered on this page by L. P. Wiegand & Sons, Cleveland, Wis. This bull, Pandora's King Sappho, is a fine individual of good, straight type, well grown and from heavy producing lines of blood. His dam is now on yearly test and in January made 82.9 pounds of fat. This is equivalent to 103.6 pounds of 80 per cent butter. She is a large, fine, typey cow, showing great capacity and constitution. She is a choicely bred animal being a daughter of the noted bull, King Sappho King, that has a large number of register of merit daughters. She is expected to make considerably over 600 pounds of fat. The sire of the bull offered for sale is Bonnetta King, whose dam has a fine register of merit record made in eleven months. Here is an opportunity for our readers to purchase a very choice herd header.—Adv.

The Acme Line.

THE Acme Harvesting Machine Co., Peoria, Ill., are advertising a grain binder on page 6 that has several features which will appeal to farmers who have cut much grain. They are an all steel rotary butt adjuster, a stop packer device, twenty-five starting points for the needle, self-acting twine tension and adjustable pitman. All Acme harvesting machinery and hay tools are made to please the farmer and they stand first class in every respect. Perhape you will be needing a new implement in a short time. The best way to buy machinery is to find out the best one for your needs before time to order. To do this get the new Acme catalog which contains a complete discussion of harvesting and haying machinery. Write direct to the company for it and please mention The Wisconsin Farmer in your letter.—Adv.

"Selecting and Developing the Jersey Herd"

Is a booklet by Prof. Hugh G. Van Pelt. It tells how you can build a well-developed, money-making Jersey herd by proper selection and judicious breeding. The future of your dairy herd depends upon how you select your foundation animals and how they and their offspring are developed.
The Jersey cow combines beauty with dairy conformation. Healthy, vigorous and profit-producing, she lifts the mortgages and increases bank accounts. Send for book today.

HORSES.

IMPORTERS AND BREEDERS OF

PERCHERON, BELGIAN AND CLYDESDALE STALLIONS AND MARES

WE now have in our barns more big-boned, rugged draft colts, from yearlings to 4 and 5 years, of the different breeds than ever before. We have two-year-olds that weigh over a ton—herd headers and show propositions.

Five farms over 1,000 acres devoted to the horse business. We do all our own buying and selling, grow all our own feed. Our economical way of handling stallions saves money for the purchaser. We guarantee all horses sold and can sell you a high-class stallion cheaper than any other firm in America.

We are located in North Central Iowa, 20 miles from the Minnesota line, on the C. M. & St. P. Ry.; midway between Mason City and McGregor.

Send 20c in stamps for large Horse Hanger which shows our Main Farm and sales stables. Correspondence a pleasure. **We have a horse for every purse.**

THE FARMER-MECHANIC

PAIGE

The Standard of Value and Quality

Power!!

Few of us have the need or desire for a racing car.

We are quite content to let the "other fellow" take his chances at 70 miles an hour—while we spin along comfortably and safely with the speedometer needle registering 25 or 30.

But *every* man wants Power in his automobile—and particularly the farmer.

It is good to sit behind a motor which responds eagerly—bouyantly—to the slightest touch of the throttle.

It is good to know that you need only "step on" the accelerator—and the steepest hills will flatten out like smooth boulevards.

It is good to realize that you command a vast store of reserve power which will easily take you through the heaviest sand roads "on high."

It is good to know that your automobile is a staunch, sturdy, dependable help-mate—not a treacherous weakling that will lay down when the real work begins.

In a word, it is good to own just such a car as the five passenger Paige "Six-38", or the larger seven passenger model, "Six-46".

Both of these cars are thoroughbreds—every inch of them.

They are just as handsome as automobiles could possibly be, and they both are easily capable of going 60 miles per hour if you desire to go that fast. But—first and last—they are made for work—*consistent* work—*day in and day out work.*

Paige owners don't have to make apologies or "offer excuses". Their cars are out of commission at one time only—when they are locked up in the garage at night.

And—best of all—you can readily establish these facts for yourself.

Neither of the Paige models are "experiments". They have both been put to the gruelling test of more than a full year's road work by thousands of owners.

All that you need to do is get in touch with the nearest Paige dealer.

Let him *prove* his case. Let him introduce you to men who have invested their money in these cars. Listen to their experiences—ask for their honest opinions.

Then, you will know whether Paige cars are reliable under all circumstances.

Then, you will know whether Paige cars are economical to maintain.

Then, you will know whether Paige cars are, in actual fact, "the standard of value and quality".

Do this—while the Dealer can still make immediate deliveries.

FAMILY CIRCLE TALKS
BY THE PUBLISHER

A RURAL THRIFT CAMPAIGN.

I AM greatly interested in a report which comes to me of the inauguration of a thrift campaign for country boys and girls. My only regret is that the idea did not originate in the grain belt. It remained for an eastern state (Pennsylvania) to launch the campaign, which already bids fair to be quite generally adopted, here in the grain belt more than any place else, I sincerely hope.

The manner in which the plan was worked out, as a subscriber in the East sets forth in a letter to me, was this: The county agent, the local bankers and other interested parties visited a typical country school and informal talks were made on the value of saving the pennies when one is young. Then a poll of the class was taken. Of the thirty-one pupils in the school, five or six already had savings accounts, while all the remainder expressed a desire to start such an account. A day was set for the trip to town. On that day one of the town banks sent out a big motor truck, in which all the thirty-one pupils and their teachers rode, in high glee, to town. Both the local banks were visited, and when the last deposit had been entered it was found that thirty-one pupils of that one rural school were possessors of pass books with sums ranging from 50 cents to $3 to their credit. The day ended with a tour of inspection of the banks, the great steel doors of the vaults, with their intricate time locks, being particularly interesting to young and old.

I am confident in my own mind, that the plan will work out well and am free to predict that every one of those thirty-one farm boys and girls will be found willing savers, taking or sending their savings to town every little while and finding the greatest happiness in watching their deposits increase. I earnestly hope that we of the grain belt will not let our pride overmaster us, but will copy the Pennsylvania plan, perhaps improving upon it, wherever possible, for the thrift habit is undoubtedly strong with us here in the middle West, where the deposits in our banks (both state and national) are steadily increasing and where many farmers are loaning money instead of borrowing, with mortgages on their farms as security. The grain-belt banker is right, who said:

> A habit is like quicksand. The longer you remain within its control the tighter its grasp becomes. The savings habit is no exception. From a small beginning the child or young man or young woman sees the possibilities of saving money, and from time to time new ways of saving appear here and there, which are incorporated into the habit easily and handily.

The other day one of the richest and best-known bankers of Chicago retired from active business. He is worth millions and is a power in the financial world. A newspaper reporter asked him the secret of his success, and the powerful banker gave it in one word: Thrift. He went on to declare that he never speculated, admitting that he cannot even now read the stock broker's ticker intelligently. He added:

> What fortune I have was built on my early savings. If a man never starts to save he will never get anywhere. The start is everything. Once a savings account is started the rest is tolerably smooth sailing.

I do not know when the value of keeping everlastingly at it has been more strikingly impressed upon my mind than by an item, of only a few lines, which I found in a country newspaper the other day. It went on to state that the $1,000 prize offered by a certain bank to the person who would start an account with 1 cent and double the deposit for thirty consecutive days has not been claimed. "It set some folks to figuring and one answer was that it could be done with $14,928,720.07." I was "from Missouri" when it came to this last assertion, but a few minutes' figuring showed me that the statement was correct. If you will deposit 1 cent in a bank today, 2 cents tomorrow, 4 cents the next day, 8 cents the next, and so on for thirty days, the deposit on the thirtieth day will be $5,322,309.12. Now I am not going so far as to say that there is any grain-belt farmer, prosperous as they are, who is rich enough to do this; that would be silly. But I do pass the item and the fact along to you to show how little things multiply if we keep everlastingly at it. Some of my young friends have joined what are called Christmas savings clubs. They started out by depositing a nickel in the bank the first week, 10 cents the second, 15 cents the third, and so on; increasing the deposit 5 cents each week. At the end of fifty weeks they will have $63.75 on deposit, to which the bank promises to add enough interest to bring the total up over $65. The idea is that the depositors will have enough money to buy their next Christmas presents, simply by saving a few nickels each week, which will never be missed, but which amount to quite a sum, in the aggregate.

The Pennsylvania thrift plan is a good one; I am delighted to see the rural sections in the grain belt waking up to the value of small savings. Even in these piping times of prosperity we should save the pennies, and particularly should the farm boys and girls be encouraged to commence their savings accounts early. Shall we all join in the thrift campaign as set forth herewith?

THE GASOLINE SITUATION.

AS THE gasoline situation becomes more serious, relief looms more imminent. An investigation by the attorney-general of the United States, to determine whether a criminal conspiracy is back of the rise in price, was ordered last week by the United States senate. The debate was spirited and brought out the fact that the members are hearing from the folks "back home," particularly here in the grain belt, in most emphatic fashion.

But congress is not the only avenue of possible relief. During the past week manufacturers of motor cars connected with the National Automobile Chamber of Commerce announced their intention to incorporate a company with an ultimate capital of from $5,000,000 to $10,000,000 to produce gasoline and other products of petroleum, with the purpose of "demonstrating that gasoline can be produced and sold at a profit at a price somewhat lower than that now prevailing, and within the means of all users of motor cars and motor boats." Personally, I can see greater prospects of relief here than from almost any other source. The automobile manufacturers realize that the day is coming when the sale of motor cars will show a decided slump unless the price of the motive fuel is brought down within the reach of all. With the knowledge that their sales will be affected, the motor manufacturers may be relied upon to do everything in their power, and to utilize the inventive ability at their command to the utmost, to bring relief. The bright minds which have been devising new motor conveniences and accessories for some years past will be put to the task either of finding a substitute for gasoline or making its distillation a more economical matter so that the price may be reduced. With the motor manufacturers thus at work and with congress trying to find out if the price of the product, as now distilled and marketed, is unduly high, I predict the day is near when we can fill our tanks for 12 to 15 cents a gallon, as we were doing last summer, before the present unprecedented rise in price began.

One thing is certain: The farmers will never give up the new hired man which has taken so much of the arduous labor off their hands—the gasoline engine. Neither will they ever forego the business-increasing and pleasure-adding automobile which is a necessity now upon the farm, no longer the luxury which it was once an extravagance to buy. I repeat: The gasoline situation is serious, but relief is in sight. I believe it will come sooner than now seems possible to many of us.

SUCCESS OF CO-OPERATIVE BUYING.

NO SUBJECT upon which I write seems to bring forth a greater number of letters from interested readers than the one of co-operative selling and buying. It is quite evident to me that the great body of farmers, the grain belt over, are ready for such a "get together" movement as was never witnessed before in agricultural sections.

Here, for instance, is Mr. E. E. Shull, of Ottawa, Kansas, writing me a most interesting and valuable letter setting forth the work in detail of a farmers' co-operative organization, of which he is a member. I cannot refrain from passing some of the facts along to my readers. Mr. Shull tells how, by organization and shrewd investigation, a carload of seed oats was bought at 52 cents a bushel, delivered, the purchasing committee being allowed a half cent a bushel for their trouble. The same kind of oats, he adds, was selling at the elevator for 60 cents. The organization also bought a carload of kafir seed for $1.01 a hundredweight, allowing the purchasing committee 4 cents a hundredweight for their trouble and to pay any possible shortage that might be found. He gives the details of this deal in this manner:

> This car of kafir was bought in Oklahoma, from a grain company, and shipped to a member of the committee with a bill of lading attached and paid through one of the local banks. Arrangements were previously agreed upon with the bank. The committee gave the bank a note for five days, until the farmers in our club could come in and get the amount of kafir they subscribed for. This committee collected from each farmer for the amount he hauled away and turned the cash back to the bank to pay this note.. In three days' time everything was settled, note paid and the committee turned back into the farmers' club treasury over $8 above their cost of labor and other little expenses. The local dealer was charging $1.25 a hundredweight, or 24 cents more than we bought it for co-operatively. The committee is allowed $1.50 a day apiece for the actual time used in buying and disposing of a car. They first go to the local dealer and get his lowest price on a car. They try to deal with him, if possible, making it clear to him it is a cash deal and the farmers will take it off the car. Give your local dealer the first chance, then he cannot have a grudge if you do better elsewhere. You cannot succeed in this co-operative buying unless you buy in car lots.

I have had many letters on this subject, but none are more encouraging and inspiriting than Mr. Shull's. He goes right to the heart of the subject and gives information and advice that should lead many other communities to get together and buy co-operatively, as well as to market their produce in that way.

I have in mind a little town in central Iowa which is practically owned and controlled by farmers, who have established their co-operative headquarters there and who buy and sell together as a unit. The grain elevator is the prime and central interest, but everything from coal to lumber and groceries is bought in wholesale lots and retailed to the farmer members of the co-operative organization at actual cost, while the entire countryside markets as a unit, in large lots and with their produce all graded and standardized so as to top the market. In the last year, so I am informed, the elevator company has taken in more than 400,000 bushels of grain and paid out over $200,000 to farmers. At that, the business has been quite profitable, for the first year of its existence the organization paid 95 per cent profit upon a capitalization of $5,000.

I should like very much, indeed, to have other letters like the one written me by Mr. Shull. Let us have figures showing the actual working of these co-operative organizations. It is all very well to write theoretically of the underlying idea and to say we favor it and so on; what we need are facts with which to confuse and confound the opposition and to stimulate ourselves to larger endeavors, so that the movement may make more headway and bring greater profit to farmers generally.

NEIGHBORHOOD CLUBS.

SINCE writing on the subject of neighborhood farm clubs, a couple of weeks ago, I have had several dozen requests, from interested subscribers, for suggestions on organization, drafts of constitution and by-laws, specimen programs, and so on. I have answered each and every one of these, to the best of my ability, in every case sending the information or suggestions desired. I have been glad, indeed, to do this, as nothing pleases me more than the tendency manifest in our rural sections nowadays to "get together," in both a social and a business way.

I want to take this opportunity to repeat my former offer, to help in any way that I can in the formation of these neighborhood clubs. Do not hesitate to write to me, fearing that it may put me to some trouble or bother; nothing delights me more than to be of such assistance to my readers. I will personally see to it that a copy of what I consider a model draft of the necessary constitution and by-laws is sent to you, by return mail. Sometimes the requests for seasonable programs take a little time to answer, as I must give the matter careful thought, but I am only too glad to suggest subjects, both of agricultural and national interest, which farmers, wherever they congregate, may well afford to discuss together, pro and con. We can solve many of the vexatious problems of the day if only we can give this farmers' club movement a big impetus and set ourselves to the task—a very pleasant one, too, after we become used to it—of studying matters and discussing them together with congenial friends and neighbors in regular "get together" club sessions.

Wisconsin Tractor Demonstration.

MADISON, Wisconsin, has been chosen as the location of one of the eight big tractor shows to be held in the country this fall. The dates are September 4th, 5th, 6th, 7th and 8th. At a meeting of the Rotary Club, held in Madison last week plans for taking care of the demonstration were discussed. F. M. White, head of the agricultural engineering division of the college of agriculture, has general charge of the arrangements. The Madison demonstration will celebrate the twentieth anniversary of tractor building in Wisconsin. While in other states the tractor is a new thing comparatively, in Wisconsin tractors were made twenty years ago. Two tractor makers, now operating one of the largest tractor manufacturing enterprises in the entire country, were residents of Madison twenty years ago and were at that time studying upon and working out the first principles of tractor farming.

The writer has attended some of the big tractor demonstrations of the country and has no hesitancy in saying that a tractor show, properly put on, is one of the most interesting sights that a farmer can witness. Last year at Fremont, Nebraska, we saw tractors of all sizes and prices competing in plowing contests. We saw tractors on road construction work. We saw the light tractor which may be used with success and profit by the small farmer. We saw thousands of farmers looking on with intense interest while tractors were plowing up great fields. The demonstration was a difficult one from the tractor standpoint because of the wet and soggy condition of the ground. But the tractors did the work well and to the satisfaction of everyone concerned. There were farmers there who insisted that a plow with six or eight bottoms could not be drawn through the wet fields selected for the work. But the tractors did the work well and surprised everyone.

The tractor must be reckoned with in the future by the small farmer as well as the man who has large areas to cultivate. There are now various makes of tractors, almost 100 in all, and these are designed to fit the varying conditions of agriculture.

It is some time yet until the Madison show, but we advise our readers to begin thinking about tractors and plan to attend the show. Do a little figuring on your own farm. What work would you expect a tractor to perform if you had one? What do you think you could afford to pay for a tractor? How much does it now cost you to do the work which a tractor would do for you? These and other problems in farming will be answered at the Madison Tractor Demonstration, September 4th-8th, and it will pay Wisconsin farmers to be there. Further announcements concerning the arrangements for the big events will appear in The Wisconsin Farmer in later issues.

Live Stock Quarantine Raised.

UNDER date of March 31st the United States Department of Agriculture formally lifted the foot-and-mouth disease quarantine and the several states have followed example. The order signed, specifically removes the quarantine from a small district in Christian county, Illinois, the last area which was under suspicion. Along with the removal of this local quarantine the various federal orders restricting shipment of cattle are rescinded, so that dealers may now ship their cattle just as they did before the first foot-and-mouth quarantine was imposed. Upon notification that the United States is free from the disease all foreign governments which have placed embargoes on American cattle are expected to remove their embargoes, so that cattle raisers will then be able to resume shipments to these foreign countries.

Before this disease was controlled it had gained a temporary foothold in twenty-two states and in the District of Columbia. The disease appeared and was controlled in 269 different counties. The disease appeared in Denmark about the same time that it appeared in the United States. The area of Denmark is approximately the same as that of the three New England states, Massachusetts, Connecticut and Rhode Island. Denmark is a great dairying country and it has been estimated that the total losses there from foot-and-mouth disease in one year, amounted, approximately, to one-third of the cost of eradicating the disease in twenty-two of our states. The Danish officials were unable to carry out their former policy of slaughter and were compelled to resort to quarantine and other restrictions.

Farmers and breeders have been hard hit by the foot-and-mouth disease. There has been strenuous objection in some districts to the slaughter method, but we believe the government plan has been demonstrated to be the right one. Veterinarians throughout the country will not cease their vigilance regarding this disease. Further trouble, however, is not anticipated.

Wisconsin shippers are now free to receive and consign live stock to any quarter. Our shipping relations with Illinois and Iowa, and other surrounding states are resumed and placed in the same position as they were before the foot-and-mouth quarantine. Wisconsin still makes an exception of Oregon and Washington, and it is necessary to have a special permit to ship cattle to New Mexico, Kansas, Arizona, Nevada and Oklahoma.

In brief the action of the federal department and of the Wisconsin state department, removes the restrictions which have been an embarrassment to our live stock shippers for the past year and a half. This action is expected to stimulate the sale of our surplus stock in other states, especially the considerable amount of surplus dairy breeding stock which is now on hand in the state.

Larger Wisconsin State Fair Grounds.

AFTER many years of litigation and delay the ten acres known as the Fleming tract, which lies just east of the present state fair grounds at Milwaukee, has been turned over to the state, and visitors to the 1916 fair next September will see larger fair grounds. The deeds conveying the property to the state were signed recently and these ten acres will be a part of the fair grounds. The deeds conveying the property to the state were signed recently and these ten acres will be a part of the fair grounds and fenced in before the next fair opens.

In addition to affording the fair additional ground space, which was badly needed, the deeding of this ground to the state makes it possible to spend $100,000 this year on permanent improvements. This $100,000 is a part of the state legislature's appropriation which was to become available as soon as this land became the property of the state by gift. Milwaukee county bought the property; deeded it to the state as an appreciation of the fair and in an effort to help enlarge the fair. In case the fair is ever moved from Milwaukee the property automatically reverts, by the reading of the deeds, to Milwaukee county, so that it can only be used for state fair purposes.

Of the $100,000 available $50,000 will be spent on the new sheep and swine pavilion, which will be completed for the 1916 show. The remaining $50,000 will be spent for an addition to the grand stand, which will be enlarged as future appropriations, dependent upon the transferring of this land, become available. The new fence will be completed with funds that will be derived by the sale of four houses deeded to the state with the ten acres. This will greatly improve the appearance of the grounds, and work on all these improvements will start within a few weeks.

Wisconsin Jersey Enthusiasm.

ENTHUSIASM and co-operation among dairymen in Waukesha county, Wisconsin, is not confined by any means to the lovers of the Holsteins and Guernseys, as many have been led to believe. Although these two breeds predominate the Jersey breeders are contributing their share toward putting this Wisconsin county on the map as one of the great dairy breeding counties of the nation.

The writer had the pleasure recently of attending the annual meeting of the Waukesha County Jersey Breeders' Association at Waukesha. There were present about thirty breeders who were as enthusiastic as any we have met.

These breeders are convinced that the Jersey is an economical producer of milk and that the only reason she has not kept pace with the Holstein and Guernsey breeds in Wisconsin, in point of numbers, is that breeders have been too easily satisfied. They have failed to realize the value of co-operation and advertising. The association formed two years ago has thirty-five members in good standing. Its members have been interested in general dairy stock development in Waukesha county. To this end they have subscribed to the sales pavilion fund. The association has offered a male calf as a prize in the county calf contest. These efforts are along the line of co-operation to the end that Waukesha county shall become known as a center for foundation stock for all the dairy breeds. The Wisconsin Farmer has had a good deal to say in the past about the enthusiasm of the Guernsey and Holstein breeders in Waukesha county. Now we are glad to report that the Jersey men are also joining hands. Ayrshire breeders, though few in numbers at this time, are catching the same spirit, not only in Waukesha county but in the entire state. That this community effort wins is evidenced by the fact that Waukesha county dairy stock has a ready sale at all times.

Mr. F. F. Showers, of Delavan, president of the Wisconsin Jersey Breeders' Association, outlined plans for the coming state convention. The Waukesha association has invited the state association to meet in Waukesha at the same time as the county summer meeting. Selection of the place is left to the directors as well as the date. Delavan has also been suggested by the Walworth county breeders. Mr. Showers said that Jersey enthusiasm is increasing so rapidly this winter that two state conventions will be held this year—one in Southern Wisconsin and one in Upper Wisconsin. These conventions will be held on succeeding days with the same speakers. The aim is to reach a greater number of breeders. Waupaca, Eau Claire and Wausau have been suggested for the Upper Wisconsin convention. The dates will be late in June or early July, and President Munn, of the American Jersey Cattle Club, has promised to attend both conventions. The details will be announced later, but it will be well for every Jersey breeder to be planning now to attend. As Mr. Showers said, the future of the Jersey breed, despite its wonderful outlook, depends largely upon the interest taken by Jersey breeders of the state. Backed by enthusiasm like that in Waukesha county the state association could soon become one of the largest in the country and make Wisconsin the leading Jersey state of the Union.

Where Wisconsin Leads.

B. F. HARRIS, of Champaign, Illinois, chairman of the agricultural committee of the American Bankers' Association, gave Wisconsin farmers a vision of their wealth and possibilities, in his recent address in Madison. He showed that there is no state in which agriculture is better balanced than Wisconsin. Illinois leads Wisconsin in the value of crops per improved acre. None of us deny that part of Illinois has very rich soil and wonderful producing power. But Wisconsin gets the best of her sister state in the value of live stock products per acre, and at the same time occupies an enviable position in the value of crops per acre. So great is the live stock wealth of this state that it overshadows the slight loss we have on value of products taken directly from the soil. When we add the crop values per improved acre, and the live stock values per improved acre, Wisconsin leads other leading agricultural states, the following being the figures as quoted by Mr. Harris:

Wisconsin, $22.45 per acre; Illinois, $20.81 per acre; Iowa, $20.30 per acre; Ohio, $20.19 per acre; Indiana, $20.16 per acre; Michigan, $19.77 per acre; Missouri, $17.45 per acre; Minnesota, $14.20 per acre; Nebraska, $13.14 per acre; Kansas $12.02 per acre; South Dakota, $11.22 per acre; North Dakota, $10.02 per acre.

Here we have a forcible illustration of the value of diversified and live stock farming. The average dairy income per farm in Wisconsin, according to Mr. Harris, is $302.12. In Minnesota the average dairy income per farm is $187.14 per farm; in Iowa it is $143.73 per farm, and in Illinois $125.73 per farm.

With these interesting figures at hand it is not difficult to understand why farming is a profitable occupation in Wisconsin. Dairying is not all the game, although in many sections it is the chief industry. But it is an industry which does not interfere entirely with other branches of profitable farming in our state. We come almost up to the average of other rich agricultural states in farm crops, and the dairy business thrown in for good measure puts us away over.

So we find that Wisconsin is not first in corn, not first in wheat, not first in a number of the leading crops, but at the same time she has an average revenue per farm which is the envy of her sister agricultural states. And she is keeping up the fertility of the soil, which means much. Wisconsin farms under a proper management of dairying grow richer instead of poorer.

Wisconsin Dairymen Interested.

WISCONSIN is interested in a bill recently introduced in congress by Representative Linthicum, of Maryland. The bill calls for an investigation of the dairy business and its ultimate object is a system of federal inspection of creameries. The "whereas" section of the bill contains an alleged statement from the bureau of animal husbandry saying that almost 95 per cent of the creameries of the country are insanitary to a greater or less degree; that over 61 per cent of the cream used is unclean, decomposed or both; that 72 per cent of the cream is not pasteurized; that a large per cent of all dairy cattle are affected with tuberculosis; that infected dairy products are among the active agents in the spread of tuberculosis, typhoid fever and other infectious diseases.

Having read the preamble to this bill one is more than half inclined to discard all milk, cheese and butter from the house and never permit any of these products to gain an entrance to the home again.

After painting as black a picture as possible in the "whereas" department of the bill, the author continues to resolve as follows:

Resolved, That the speaker of the house of representatives appoint a committee of five members of

the house whose duty it shall be to investigate and report as speedily as practicable (a) whether conditions prevailing in dairies and dairy products seriously menace the health and property of the people of the United States; (b) whether federal inspection and supervision, either alone or in co-operation with state and municipal inspection and supervision is necessary to the reasonable protection of the health and property of the citizens of the United States; (c) if so, then the best and most economic methods of inaugurating and enforcing such inspection and supervision.

Second. That for the purpose of fulfilling its functions said committee is empowered to summon and examine witnesses, enforce the production of records, and to do all other things needful and lawful to accomplish its purpose.

Resolved further, That the expenses of said inquiry and investigation shall be paid out of the contingent fund of the house upon vouchers approved by the chairman of said committee, to be immediately available.

In his speech supporting this proposed investigation Congressman Linthicum calls attention to the work of one McCann, of New York City, and this reference may not strengthen the measure among many Wisconsin dairy people.

This is largely a case of magnifying a half truth until it is made to appear terrible. A barrel of butter in which there is one speck of dust may be truthfully said to be "more or less" unsanitary and unclean. And we are inclined to the belief that just about such extreme cases as this must have been taken into account when the bureau of animal husbandry arrived at its conclusion that 95 per cent of the creameries of the country are unsanitary.

The Wisconsin Farmer is positive that there is no such percentage of unsanitary creameries in this state. We are just as positive that there are creameries which can stand a great deal of cleaning up.

The farmer-dairyman would probably lose nothing if the federal government were to take over the inspection of milk, butter and other dairy products. It would mean a revolution in some sections of the country, as the government would no doubt be as thorough as it has been in cleaning up other lines. There is an element of good sense in this matter of having the federal government handle the inspection of food products. The government has demonstrated its efficiency in the administration of the pure-food law. Another excellent example is the stamping out of the foot-and-mouth disease among cattle.

The government does things thoroughly. But this offers no occasion for making the dairy situation appear so black just for the sake of cleaning up some spots. In his address before congress, Congresman Linthicum admits that he has no personal knowledge of the dairy situation in the country. He is doubtless inspired by McCann and others. As we have before stated, McCann visited Wisconsin some months ago and the trail of contradictions and denials of his statements regarding Wisconsin and what people told him here, has been so long as to warrant us all in taking his stories with a decided mental reservation.

But the progress of this effort to put all dairy inspection in the hands of the government will be watched with interest by Wisconsin farmers.

Wisconsin Land Clearing Special.

ARRANGEMENTS have been made for a Land Clearing Special train to make sixteen stops in eleven of the principal counties in Upper Wisconsin, some time within the next few weeks. This train will run via C. & N. W. and Chicago, St. Paul, Minneapolis and Omaha railroads. The demonstration work will be in charge of the Wisconsin College of Agriculture. Manufacturers of stump-pulling machines will co-operate. While the schedule of dates is not definitely fixed it is practically decided that stops will be made at Mountain in Oconto county; Deerbrook and Elcho, in Langlade county; Crandon, in Forest county; Three Lakes and Woodruff, in Oneida county; Eagle River, in Vilas county; Bayfield and Ashland Junction, in Bayfield county; Hayward and Radisson, in Sawyer county; Bennett or Solon Springs, in Douglas county; Spooner, in Washburn county; Barron and Rice Lake, in Barron county; and Cornell, in Chippewa county.

There will be demonstrations of the various methods of land clearing, and this should attract great attention in Upper Wisconsin.

At Lambing Time.

THE lambing season is upon us and if there ever was a year when the shepherd should take more than ordinary precautions to save as many newcomers as possible, this is certainly one of them. Prices are steadily advancing, records being made every few days. There are a number of precautions to be taken before the lambs come. The ewes should be kept as quiet as possible. Rams should be taken away from the flock, otherwise they are almost sure to injure some of the ewes with their horns.

While the ewes should be kept quiet, they should have exercise which can best be secured in a pasture, preferably close to the buildings. At night they should be housed in open, dry sheds well provided with plenty of bedding. While separate stalls should be provided for the ewes a day or two before lambing it is nevertheless well to keep the quarters for the entire flock clean and dry so that all may be comfortable, and if any lambs should come at unexpected times they will not suffer.

The ewes should be well fed before lambing, so that they may be strong and in condition to provide a good flow of milk. Good alfalfa or other legume hays make excellent roughage; with this a small amount of corn and oats should be furnished. If legume hay is not available a little more grain should be provided—a little bran being excellent before lambing to prevent any tendency to constipation. With alfalfa or clover, bran will not be necessary.

Every man who understands sheep knows how necessary it is to give the closest attention to the lambs until they are about two days old, or until they know their mother and her udder has been carefully examined to see that the milk flow is normal. Here is some good advice offered by an experienced shepherd that will be of special interest to beginners. He writes:

> Always have an attendant present when the lambs are born, because it often happens that some of them come with a covering over their nostrils that the weak lambs cannot break. When that happens the lamb soon dies unless someone is present to render assistance. By taking such cases immediately after birth and opening the lamb's mouth and blowing into it strongly enough to inflate its lungs it may easily be saved. That is only an example of why someone should be present at lambing; many other things may happen. Sometimes the youngster may need to be warmed by rubbing, or weak ones may be helped by giving them a teaspoonful of brandy in a little warm milk.
>
> It is especially necessary to watch the lambing ewes during chilly, damp weather. There is, perhaps nothing more disastrous to either lamb or ewe than wet weather at the time of birth. Every man who attempts to raise lambs should be provided with a milk bottle and be ready to provide extra feed for the little ones during the first few days, should any of the ewes fail to give a sufficient flow at first. The successful sheep man must be prepared and willing to lose some sleep during the lambing season, for while a single lamb may not be so very valuable, yet if half a dozen are unnecessarily lost a big sum of money is gone.

The trouble with a great many beginners in the sheep business is that they fail to give proper attention to the ewes a week or two before lambing and of the lambs until they are one or two days old. Once a lamb is two days old there is little danger of its getting in trouble, but before that it is extremely delicate and subject to many mishaps. Lamb raising will undoubtedly be very profitable this year and it will pay unusually well to look after all the little details incident to the business.

Death of Mr. Orlo H. Martin.

MR. ORLO H. MARTIN, well known in Wisconsin live stock circles as a successful breeder of Scotch Short-horns, Shropshires and Perckerons, died at the home farm four miles west of the village of Bloomington, Grant county, on Sunday, April 2d. He was fifty-one years old and his entire lifetime had been spent in the county in which he passed to his reward. Leakage of the heart hastened the end, and burial was in Lumpkin cemetery on Tuesday, April 4th.

Mr. Martin was born February 4, 1865, in the house and on the farm where he died. With the exception of about two years in business in the village of Bloomington his life was spent on the Martin farm, and in every movement for better farming and better breeding he was always a prominent figure. He always took an active interest in the government of his town, and at the time of his death was chairman of the town board. Although busy with his farming he had time to devote to the interests of his town; served it faithfully for many years and was repeatedly chosen chairman of the town board.

Mr. Martin never had the desire to leave the farm that so often is found in the young men of today. He took the greatest pleasure in his chosen vocation, farming and stock breeding. He secured his education in the little "red schoolhouse" of Grant county, and thirty years ago assumed management of the Martin farm when his father died. He was then a young man, just entering upon his life work. To succeed he realized that he must find pleasure in his work and must study farming and breeding just as he would have to study any other business. The Scotch Short-horn was his favorite breed of cattle, and thirty years of breeding and study made him an authority on Short-horns. Last fall he was instrumental in assisting in the organization of the Grant County Short-horn Breeders' Association, and served as its secretary and treasurer until his death. He developed some splendid specimens of the breed and had attained a more than local reputation. He believed in the aristocracy of agriculture, and to his credit he brought up in the same belief his sons who will now assume the management of the farm. Mr. Martin, in late years, had developed considerable skill in veterinary surgery.

Grant county breeders, in the death of Mr. Martin, have lost an enthusiastic live stock man and a competent adviser. The town of Bloomington has lost an efficient and faithful official and the live stock interests of the state are deprived of the services of an able breeder. Mr. Martin leaves besides his widow three sons, Jay, Milton and Roy, all of whom live on the home farm, and one daughter, Frances. The Wisconsin Farmer learns with deep regret of Mr. Martin's death.

Wisconsin Auto Sales Increase.

DUE largely to the prosperity of our Wisconsin farmers the number of automobiles in Wisconsin is increasing by leaps and bounds. On March 31, 1915, there were 30,000 machines registered and the total number on the same date this year is 50,500. This does not include the total number of automobiles in the state in either instance, but simply the total registered to March 31st. Mr. Alex Cobban, who has charge of issuing licenses, says that at the present rate of registrations the total number will probably run to 110,000 this year. This will produce $550,000 in revenue for the state.

The increased service which automobile manufacturers are offering in their cars and the general reduction in price, as well as the propsperous condition of the state, are responsible for the big increase. There will be anywhere from 35,000 to 40,000 new cars sold in Wisconsin this year if past records may be taken as a criterion.

Painting to Protect and Beautify.

THE value of proper painting lies not only in its protecting and preserving qualities but is very evident in what artists and others are pleased to call our esthetic sense—in plain English—our sense of beauty. There are but few people, no matter how poor or humble or illiterate, that do not take pride in a well-kept home. In a day's drive in almost any community one will find many humble homes that have been shined and polished with a love that is akin to righteousness—places that shrubs and paint and loving labor have transformed. And the wonder of it all is that with the opportunities each of us have for beautifying our homes, some still fail to advance.

Paint and shrubbery will transfigure the meanest looking house in the world. In artistic circles we have the habit of calling this planting of shrubs and making lawns by the title of landscape gardening, and probably that is correct, but after all it is nothing more nor less than the gift of beautifying homes. We know a man who is making a very comfortable living at it, and this is his plan: He will buy a run-down farm and proceed to repair the buildings and fences. Then he begins to paint and plant. Of course, he aims to build up the soil as he goes along, but he seldom gets much done along that line, for the paint attracts buyers before he owns the farm long enough to make much headway. That is his intention, and he started this work after he had failed in business and was at the end of his resources. Lack of capital prevents his working on a large scale, but nevertheless he is making good. The strangest part of it is that most of his buyers profess to have no love for the things he has done. They say that paint is cheap and they do not care for the "trimmings." It is soil they want—they say—yet we have seen buyer after buyer pass soil that was as good and often much better and come to his terms. The looks of the place attracted them whether or not they knew or would admit it.

Paint is not expensive and under present methods of marketing can be purchased ready mixed in a form that the novice can put on with perfect assurance of excellent results. Or if he prefers he can mix his own paint, but unless one has had some experience in mixing colors one had better stick to white lead and oil or other standard colors or buy his paint ready mixed.

For first coat work on material that has never been painted plenty of oil is necessary and it should be well worked into the timber. Second coat work is much more particular unless three coats are to be used. In this case the brush laps may be left somewhat uneven and the third coat will cover them. But on the last coat be sure to work out the brush marks and spread the paint evenly. One cannot be told how to properly do this and it must come by experience or have someone who has had experience show how it is done by skilled painters. The last is by far the best manner of learning, for an experienced painter can show you more in thirty minutes than you will learn from a dozen articles, and you will know it better for having seen with your own eyes.

For inside painting it is best to use the paint especially prepared by the manufacturers for that class of work or to use turpentine instead of linseed oil in mixing and thinning the colors. This makes a dull finish instead of the glossy outside work and is known as flat finish. It is preferable to the high gloss for walls and ceilings. No better looking interiors can be had than those finished with paint of the right sort, and besides looking well they are sanitary and easily cleaned. The standard sorts of inside paint sold will stand washing, and physicians agree that painted walls are much better than papered ones.

The amount of outside painting one man can do in a given time depends on the man himself and the conditions under which he is working. However, an ordinarily handy man can spread from five to ten squares in a day (not square feet—squares are reckoned as being ten by ten feet), depending upon the surface upon which he is working and his ability to work rapidly. First coat work should go on slow enough to allow a thorough working in of both oil and paint and all knots and blemishes should be shellacked before the paint is spread. This is the important coat, for upon it depends the worth of the other one or two as the case may be. Then in the other coats it is best to use either turpentine or the so-called commercial driers as sparingly as is consistent, for drier used to excess will eventually cause paint to peel and blister

The Farmers' Open Forum

WITH CONTRIBUTIONS FROM READERS OF THE WISCONSIN FARMER

The Growth of Alfalfa.

To the Editor:—Clover and alfalfa are especially valuable crops, as hay and as a means of restoring plant food, nitrogen to the soil. They are crops which are rich in animal foods that produce fat, butter fat and energy which is required in nearly all phases of animal life. In our eastern states we find alfalfa used to a very great extent in the production of milk and butter; we also find it used in the production of eggs. In many states of the corn belt we find it used as a means of fattening hogs for market. In the West it is used extensively as a means of fattening sheep and cattle for early winter markets. In all of these ways it may be used as either green feed or hay. We find in many sections of Wisconsin men who have large dairies, say they would not know what to do without it. Now we could easily say that if one of our farmers were to raise it that it was his luck to succeed, but we don't say that of those who all over the United States are succeeding. It is one proof that it should have a place in our rotations.

Alfalfa like other crops is not adapted to any and all climates. We have learned from our experience that corn from Missouri and Tennessee will not do well in Wisconsin or in other words it is not acclimated. So in selecting seed of either corn or alfalfa we must get seed we know is adapted to this state and region. Don't buy seed from some Missouri seed firm, and if it does not grow say alfalfa is no crop for Wisconsin. Let us give it a fair trial at least and get seeds from Wisconsin-grown alfalfa.

Soil is another question we must consider in growing alfalfa. Most any deep, fertile, well-drained soil is good. That is, we don't want a soil that is shallow, hard, and lumpy, but one with a surface that is from eight inches to two feet deep at least, and this surface soil must be rich in humus and contain the plant foods required for crop growth. Then too, the successful growth of alfalfa depends a great deal upon the amount of water in the soil. We say the soil must be well drained, that is to say that we shouldn't expect alfalfa to grow on soil where nothing else will grow, and that at a certain season of the year we find water standing on top of the soil. Drainage is the most important thing in the growth of alfalfa. Why? Because if there is water in the soil we know from our experience of late springs the soil is in a very cold condition. We find in the growth of alfalfa that we must have a warm soil and one well drained. We often find alfalfa grows best in a rolling country, and this is due to the fact that in rolling lands we have our soil in a natural drainage system. So in selecting your field for alfalfa take the soil and the lay of the land into consideration.

In preparing the seed bed for its growth let's remember the fact that alfalfa is a deep rooted plant and plow deep so as to give it a chance. It is found that the best results have been secured on soil that has been sown to some cultivated crop. The reason for this can be brought out better by a little illustration. Did you ever try to dig a post hole in land that had been in sod for three or four years? If you have you realize that it is much easier to reach the depth desired in a field that has been in a cultivated crop. So it is with the growth of alfalfa roots. A method that is very often used in preparing the soil is this:

Fertilize the field with barnyard manure and plow in the fall and early spring, disk and harrow several times until the soil is very mellow. Keep repeating this harrowing every week until seeding time so as to guard against weeds and to conserve the moisture. One must not be afraid to put too much work in preparing the soil, because it is one step toward a successful crop.

Alfalfa, like all other leguminous crops, forms nodules on its roots when certain bacteria are present in the soil. These bacteria make their home in the nodules and benefit the plant on which they exist by taking nitrogen from the air and furnishing it to the plant on which it lives.

In soils where these bacteria are present alfalfa always thrives much better than where the bacteria are not present.

The benefits due to the presence of bacteria are more marked in some soils than in others.

In view of this fact the practice of artificially inoculating fields where alfalfa is to be grown, with the alfalfa bacteria, has become rather common. One of the most used methods of doing this is by taking soil from an old alfalfa field that has been giving good results. In this method one should scatter over his fields on a very cloudy day from 100 to 200 pounds of such soil per acre and drag it in. I believe this method to be the best, taking everything into consideration. I would not advise anyone in this section to attempt to grow alfalfa without first treating the soil with the soil from an old field. Now, don't think that soil from a clover field will do as well, even though it is true that we have bacteria in connection with clover, but it is not the same kind.

Now that we have taken up the treatment of the soil we now must consider the time, rate and method of seeding. Alfalfa, unlike many crops, is not a crop to sow at the opening of spring, but it is much better to wait until later. Sowing any time between May 15th and July 1st has been found to obtain good results. In sowing, many of us think of the cost and attempt to get a good yield on from five to ten pounds per acre. In cases of these kinds we find our stand is very thin. In this section fifteen to twenty pounds would not be too much sown with a nurse crop of barley either by drill or by seeder. Of course, unlike most meadow crops, we must take care of it. It is true that alfalfa will survive without a large supply of water, but every bit of water we can save can be profitably used by the crop. In holding moisture in an alfalfa field about the only thing to do is to disk the field when conditions are right. An ordinary disk may be used for this purpose, but better than this a special spike-tooth disk can be used. This means of cultivation can be used any time after the second year just after cutting a crop or before the growth has started in the spring. This process not only serves to work the ground and hold the moisture but has a tendency to break up the crown of the plants and cause them to shoot out from lower points and thicken the stand. It also tends to keep the field free from weeds.

In harvesting we can follow the methods used in clover but we must take pains to cure it well in the cocks right after cutting before putting it in the barn, as there is great danger of alfalfa heating and so making it useless as feed. The crop should be cut when the lower leaves turn yellow even though few blossoms are out or when sprouts appear from the crown.

We should not attempt to pasture it until the third year and then one must take great care that the cattle and sheep do not become bloated. Hogs do very well in alfalfa pasture and have been known to be put in almost a condition for market without the help of other foods.

One great disadvantage is the number of weeds we have to contend with. In buying seed we should not look for the number of weeds so much as the kind, because some weeds are smothered out by alfalfa while others are not. The one most feared by buyers is dodder, a plant that lives entirely upon the alfalfa plant which makes the purchase of alfalfa seed, containing this weed seed, dangerous. There are others too numerous to mention at this time, but bear in mind any weed is bad enough.

We will close this article with a few alfalfa don't's:

Don't sow seed not acclimated.
Don't sow on poorly drained lands.
Don't sow on new ground if you have suitable old ground.
Don't use land where snow accumulates and forms ice sheets.
Don't forget that hardy seed is the safest and cheapest in the end.
Don't sow seed until you have weeds under control.
Don't sow until you have your seed bed "like a garden," and then go over it again just for luck.
Don't sow seed very deep.
Don't waste good seed on poorly-prepared land.
Don't pasture alfalfa the first two years.
Don't forget hay cut in early bloom has the greatest food value.
Don't forget that the leaves are the valuable part of alfalfa hay.
Don't let your field go into winter without a good growth for protection.
Don't sow on acid soil.
Don't forget these don'ts.

Rye on Corn Land.

To the Editor:—In growing pure-bred seed grains my motto is to plant only the very best of good seed on a well-prepared seed bed. In growing rye I try to put it on corn ground when season permits. As I find it

JOHN SCHWARTZ.

does not lodge as easily as other grain, I grade out only the largest seed and plant one and one-half bushels to the acre. Last fall I threshed forty bushels per acre—that is, machine measure. Think if it had been carefully weighed it would have done much better. By growing rye it does not leave so much work for spring.

John Schwartz.
Langlade Co., Wis.

Seed Cleaned and Graded.

To the Editor:—In raising grains for show purposes there are a number of things to be taken into consideration. Special attention must be given to the selection of the seed, preparation of the seed bed, cultural methods and harvesting. Every farmer should consider these points whether he plans to show his products or not. If he does the increase in yield and the quality of his products will repay him well for his trouble.

In selecting seed we try to get the variety best adapted to our particular type of soil. Having a heavy clay soil we selected the Marquis wheat because it has a short, stiff straw and withstands drouth and is more resistant against smut than some of the other varieties that we have tried. It is a heavy yielder, the kernels being plump and hard.

After having decided upon the variety we demand that the seed be absolutely pure bred. Life is too short to waste time upon mixed or scrub seed. The seed is cleaned and graded carefully and nothing but the heaviest and plumpest kernels are sown, as we have found that these kernels give stronger and more vigorous plants.

The next in importance is the seed bed and care of the crop throughout

EDWARD PETERS, LA CROSSE CO.

the growing season. Our rye ground is plowed early in the fall and allowed to settle for some time before seeding. After harrowing the seed is broadcasted with a seeder and harrowed in twice. When it has grown sufficiently the calves are turned on to it and it is pastured. This tends to cause stooling and as a final result a heavier yield.

Our wheat ground is plowed in the fall and we like to turn down clover sod when possible for this crop. Early in the spring the ground is disked. Last year we commenced the 7th of April. After disking the harrow is put into operation and as a result we have a fine, mellow seed bed. The seed is broadcasted and the ground harrowed twice. By following these methods we have never failed to get good returns.

Harvesting is not a minor operation with us. The grain that is to be used for show purposes has to be carefully selected and handled and, of course, extra time must be put upon it. All the grain is carefully shocked to prevent discoloration as much as possible and later stacked.

We will say little about showing because we feel that to become a successful showman requires experience. The man who can produce good grains can learn to show them to advantage providing he is willing to work and learn. He must be a good observer and a good student. So much for the showing end of the business.

We feel deeply indebted to our county school of agriculture for the training received there. We plan to attend all the farmers' courses and grain shows within reasonable distance and we have never yet failed to learn something new and helpful at each meeting. Edward Peters.
La Crosse Co., Wisconsin.

Putting Hay Into Barn.

To the Editor:—At the 1913 state fair at Milwaukee there was a man in the hayloft of the modern barn who demonstrated a method of putting hay into the barn without horses. He used a large stone weight. I did not fully understand his method and would like very much to know more about it. Will you be kind enough to publish this letter in your Forum columns and request information on this subject from your subscribers?

Auburndale, Wis. C. E. Aldrich.

CURRENT EVENTS

THEODORE ROOSEVELT and Elihu Root are reported to have "made up," which would indicate that Colonel Roosevelt is either going to work for the republican nomination for president or he will support whoever receives that nomination. It will be recalled that Roosevelt and Root were the best of friends some years ago, Root sitting in Roosevelt's cabinet as secretary of state. They fell out four years ago, however, Secretary Root being chairman of the republican national convention, at Chicago, which Colonel Roosevelt bolted, after the "steam roller" tactics had convinced him that he could not get a square deal either from the chairman or from the main body of delegates. The two men have been very bitter against each other ever since. The surprise of the public was considerable, therefore, when it became known last week that the two had met at dinner, in company with Senator Lodge, of Massachusetts, Robert Bacon (former ambassador to France), and other notable men, all high in the councils of the republican party. The men are said to have discussed the preparedness program altogether, saying nothing whatever about politics. The fact that Colonel Roosevelt is coming back into the republican fold, on any pretext, is the important one, however, rather than the particular issue discussed. There is a growing conviction that it will be either Roosevelt or Hughes who will be nominated by the republicans in Chicago in June and that Roosevelt will support the republican nominee, whoever he may be.

THAT Germany has absolutely no aggressive aims against the United States, Canada, Brazil or any American territory, that she is not fighting for any new territory whatever, was asserted in the most emphatic terms by the German chancellor, Dr. von Bethmann-Hollweg, in a speech before the reichstag last week. The chancellor continued by declaring that any suggestions of peace on the basis of the destruction of the Prussian military power would make possible only one answer: the German sword. If Germany's adversaries desired to continue the slaughter of men and the devastation of Europe the guilt would be theirs, he said. He characterized as "the silliest of imputations" against Germany the report that at the end of the war Germany would take measures against the American continent and attempt to conquer Canada. With respect to Belgium the chancellor said: "We must create real guarantees that Belgium shall never be a Franco-British vassal; never shall be used as a military or economic fortification against Germany." The chancellor's utterances were the most important that have been made in many months and created a profound impression. He made it clear that the kaiser is not picking a quarrel with the United States and that everything possible, within what they believe to be reason, will be done to continue friendly relations with this country, thus setting at rest the reports that Germany was deliberately estranging the United States and hoping to involve it in the general melee.

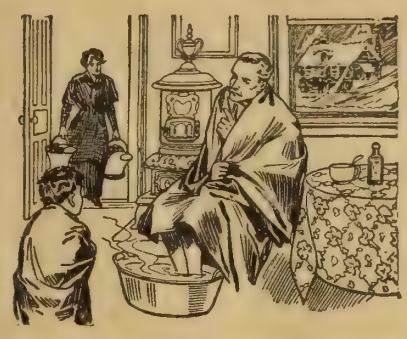
THE immigration bill, providing a literacy test and excluding all Asiatics, was passed by the lower house of congress by a vote of 308 to 87. It is now before the senate, where favorable action is anticipated. The literacy test, about which the fight against the bill had centered, passed by a vote of 284 to 107. This provision has been the cause of vetoes of similar immigration bills by Presidents Cleveland, Taft and Wilson. Sponsors of the bill believe that they have sufficient strength to pass it over a veto, should President Wilson file one. The literacy test as adopted would exclude all aliens over sixteen years old, physically capable of reading, who cannot read English or some other language, except certain relatives of persons already in this country and certain classes of refugees from religious persecution. Asiatic exclusion provisions specifically bar Hindus and add to the excluded classes "persons who cannot become eligible under existing law to become citizens of the United States by naturalization unless otherwise provided for" by existing or future treaties, conventions or agreement. Pacific coast members were satisfied with this provision, which gives legislative recognition to the existing so-called "gentlemen's agreement" with Japan for the exclusion of Japanese laborers.

THE second most destructive Zeppelin raid of the war occurred last week, when the German flying machines dropped bombs which killed fifty-nine persons and wounded 166 more. Air raids were made three nights in succession, the coast of Scotland and the northern and southeastern counties of England being attacked. For the first time since the inception of this method of warfare on the British coast, not only has one raiding Zeppelin been brought down and its crew taken prisoners but the official report recounts an exciting aerial fight between a Zeppelin and a British airman, Lieutenant Brandon, who, mounting to a height of 9,000 feet, flew over the raider and dropped several bombs on it with effect. One of the Zeppelins fell into the Thames and the crew was captured. The others succeeded in making their escape safely. Zeppelin attacks are becoming more numerous, although the English people continue to watch them with more curiosity than fear. They stimulate enlistments among the English, enraged at this method of carrying on warfare, but are exacting a heavy toll among women, children and noncombatants generally.

THE pursuit of Villa and the remnants of his band of Mexican bandits was continuing at last reports. The brilliant feat of Colonel Dodd, in riding fifty-five miles in seventeen hours, surprising and wellnigh exterminating part of the band, was repeated a few days later when another detachment of American troops caught up with another band of Villistas and in a running fight killed thirty Mexicans, wounding as many more. There are conflicting reports concerning Villa's personal condition, some asserting that he is seriously wounded, others claiming he is in good health. He is known to be making for the mountains, through a country with which he is perfectly familiar and among a people entirely friendly to him, so that the advantages are all on his side. At the same time General Pershing and his troops are following close on his heels and are prepared for a long chase, not proposing to give up until he is captured or killed, even if months shall be necessary to bring this about.

A FORMER Kansas governor, W. R. Stubbs, and a former Missouri judge, W. H. Wallace, who said they had learned by raising cattle themselves that meat packers by fixing combinations were crushing live stock growers, pleaded with a house judiciary subcommittee in congress to aid in inaugurating sweeping reforms in the packing industry. They appeared as counsel for western growers and feeders. Speaking on the Borland resolution, which would order a federal trade commission inquiry to determine whether the packers are violating the anti-trust laws, they indorsed the proposal strongly and suggested making laws prohibiting the restraint of trade in foodstuffs generally more stringent. Jail sentences instead of fines were particularly urged. "Fines are jokes," Mr. Stubbs declared. They are not effective. The producers and the consumers pay the penalty. Anyone who juggles with the prices of food when millions are struggling for bread should be imprisoned and not fined.

Have balmy spring at home during cold, raw weather!



Early spring chills and colds are inevitable with old-fashioned, drafty, uneven heating methods

The mild, delightful warmth of radiator heating makes every one happy and healthy

Real spring rarely sets in "for good" until it is nearly summer. The cold, damp, chilly days cause a lot of sickness and discomfort in homes which are not properly heated.

AMERICAN RADIATORS & IDEAL BOILERS

An IDEAL Heating outfit will show you its worth more forcibly during changeable, raw weather than at any other time. The IDEAL Boiler is made to give just the volume of heat to keep the house genially warmed and comfortable *all over*, without waste of fuel or everlasting tinkering with the fire. These IDEAL outfits are easily put in old or new farm houses. One charge of fuel lasts 12 hours or more during chilly spring days.

Get the heat that costs the least

Decide now to put in IDEAL-AMERICAN heat. Don't spend another winter without it. Safeguard your family's health. Get the Ideal outfit which will just suit your needs. Running water not necessary. Burn the inexpensive fuels of your locality and make your *house* a real HOME!

A No. 020 IDEAL Boiler and 262 ft. of 38-in. AMERICAN Radiators, costing the owner $185, were used to heat this farm house, at which price the goods can be bought of any reputable, competent Fitter. This did not include cost of labor, pipe, valves, freight, etc., which vary according to climatic and other conditions. The IDEAL outfit is the *only* feature of the house which is never worth *less* than you paid for it.

Don't put it off

Write now—today—for copy of "Ideal Heating." It tells you all about the way to get the heat that costs the least.

IDEAL Boilers do not rust or wear out — no repairs.

Sold by all dealers. No exclusive agents.

AMERICAN RADIATOR COMPANY

Imported Hemp Seed.

With hemp of the 1915 crop selling at 10 to 11½ cents per pound, double its normal price as it leaves the farm, there is a strong demand for all the seed available for sowing a larger crop this spring. Hemp seed recently has been selling in Kentucky at $11 to $12.50 per bushel, about three times its normal price, and it is impossible to supply the demand even at these high prices.

Under these conditions there may be a temptation to sow imported hemp seed, such as is purchased in Japan, Manchuria or China at less than $1 per bushel, and bought in to be sold for bird seed and poultry feed. This seed looks like that of good fiber hemp, except that it is usually larger and lighter in color. It rarely germinates more than 30 per cent. It produces short, quick-maturing plants practically valueless for fiber production.

Varieties of fiber hemp are cultivated in Japan, China and Manchuria and it may be possible to secure seed from those countries that will give fair results in the United States. The most promising varieties of foreign hemp seed for sowing in this country are Tochigi (pronounced Tochingi) and Hiroshima, from Japan, and Ferrara and Carmagnola, from northern Italy. The first generation from imported seed, however, is rarely equal to that from Kentucky seed.

If imported seed is used the purchaser should insist upon a guaranty of germination of at least 90 per cent and a statement as to the approximate height of the plants from which it is obtained. Seed from plants less than eight feet high is not likely to prove satisfactory.

Road Drags vs. Duster.

When dry weather comes the dust from the road becomes a great nuisance to the housewife who lives near the road. In many cases windows have to be kept closed tight to lessen the amount of dust that seeps in. The most effective way of reducing the dust nuisance is the use of a split log drag on the road after every rain. The road dust comes largely from the grinding up of the turned up edges of ruts made by wheels and horses' hoofs. These cannot form unless water can stand on the road bed and water cannot stand on the road bed if it is kept well crowned and well packed, as it will be if the road drag is used regularly. Dragging the roads will mean a good deal to the housewife, as well as to travelers and those who have to haul to and from the market.—[W. C. Palmer, North Dakota Experiment Station.

Patrons of the New Richmond Cheese and Dairy Company during February received an average of 45 cents per pound for their butter fat.

WOOD COUNTY TESTING PAYS.

Some Interesting Information For Farmer-Dairymen Which Has Been Learned as Result of Cow-Testing Association Work in Wood County, Wisconsin.

MANY interesting things were brought to light during the first year of testing by the Wood County Cow-Testing Association and the farmers in that vicinity are so well convinced that this is the only way in which to judge a cow's value that two additional associations have been organized for the coming year.

The Wood county association has been reorganized and is starting on its second year with a few new members who took the place of several old ones who dropped out. It was not difficult to fill their places, as the records kept during the year convinced every member and scores who were not members that the use of the scales and the test is the way to judge dairy production. There were plenty of farmers willing to go in, so it was necessary to form two other associations—one at Marshfield, known as Wood County Cow-Testing Association No. 2, which began work February 15th, and one located in the vicinity of Pittsville, known as Wood County Cow-Testing Association No. 3, which began work March 1st.

HOME OF J. C. KIEFFER, WOOD COUNTY, WHOSE COW CARRIED OFF INDIVIDUAL HONORS IN TESTING ASSOCIATION.

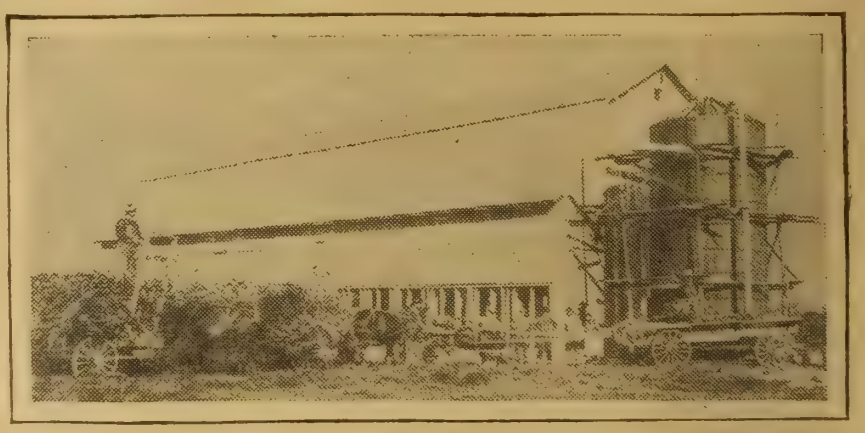
The Wisconsin Farmer is indebted to W. W. Clark, superintendent of the county agricultural school at Grand Rapids and secretary of the Wood county association, for a report of the first year's work. This report is very interesting and was compiled with the assistance of William Bassler, the tester. In looking over the herds and individual records for the year it is noted that some records are very good and some not so good. Mr. Clark reports that there is chance for considerable culling and weeding out of boarders and much of this was done during the year and much more will be done the coming year.

The best three herds during the year were those of E. E. Butters, of Marshfield; W. A. Schultz, of Auburndale, and Charles Tomfohrde, of Arpin.

Mr. Butter's herd, which was first, consists of only pure-bred Holsteins and their performance is a splendid recommendation for using only pure breds. This herd, which includes all cows that were run in the test throughout the year, averaged 13,285 pounds of milk, 449 pounds of fat, valued at $130.93. The cost of producing this fat was $62.20, which left Mr. Butters an average profit of $60.59 for his herd, which averaged about eight cows for the year. Four of these were heifers with first calves and were in test only nine months. The average production of these four heifers for the nine months was 340 pounds of fat. These heifers also have good official seven-day records. In Mr. Butters' herd four cows completed a full year's work, averaging 14,180 pounds of milk and 472 pounds of fat.

The herd of Mr. Schultz, of Auburndale, which was second, consists of both pure-bred and grade Holsteins. This herd has been built up by many years of culling through means of the scales and the Babcock test and this careful selection certainly pays. Some cows were sold and some bought during the entire year and averaged 11,378 pounds of milk and 422 pounds of fat. Two of these were two year olds and are sisters. His entire herd for the year averaged 10,034 pounds of milk, 72 pounds of fat, valued at $106.10. It cost Mr. Schultz only $46.60 to produce this fat, which left him an average profit for his herd of $59.91.

Mr. Tomfohrde, whose farm is at Arpin, has a Guernsey herd of good grades with only one pure bred. His herd finished in third place and averaged 7,488 pounds of milk, 343 pounds of fat, valued at $101.13. This fat was produced at a cost of $49.38, which left Mr. Tomfohrde an average profit of $52.27 per cow. The average number of cows in this herd for the different months was almost twenty and this is certainly a splendid showing for so large a herd. This is another herd built up by careful selection, but it is expected all of the three high herds after a few more years of testing will show much higher production. Twelve of Mr. Tomfohrde's cows were in the test the full year and these twelve averaged 7,801 pounds of milk and 376 pounds of butter fat. The herd of J. C. Kieffer, of Auburndale, president of the Central Wisconsin Fair, ranked fourth and eleven of his cows which were in test work throughout the year averaged 10,918 pounds of milk from which the average fat production was 370 pounds.



NEW BARN ON FARM OF W. A. SCHULTZ, WHOSE HERD RANKED SECOND

Princess Maude Mechthilde, nine years old, an argument for pure breds. Stock from her sold for $1,540 besides heifer on hand valued at $500.

PORTION OF HERD OF CHARLES TOMFOHRDE WHICH RANKED THIRD IN YEAR'S TESTING OF WOOD COUNTY ASSOCIATION.

The best cow in the association during the year belonged to the Kieffer herd. She was a grade Holstein that freshened November 7, 1914, and, as the test did not start until January of the following year, she lost two of her best months. Even with this handicap she carried off the individual honors, making 17,910 pounds of fat with an average test of 3.2 per cent. Her fat production was 566 pounds and her profit $117.46.

The second best individual was a pure-bred Holstein in the herd of Mr. Butters and quite a few others with records close to her records. She produced 551.2 pounds of fat. The best four Guernseys in the herd of Mr. Tomfohrde averaged 460 pounds of fat.

Among the interesting developments of the year's testing was the experience of William Bebling, of Vesper. Mr. Bebling is a splendid booster now for the test association, for his judgment of the value of a cow has been entirely upset by his use of the scales and the test.

When the association year opened a cattle buyer went to his farm and tried to buy some of his cows. One little brown cow he priced to him at $50, but he would not pay it and she stayed in the herd. He also had a nice looking black and white for which the buyer offered him $75, but Mr. Bebling would not sell at that price, as he considered her worth considerable more. The result was that both cows entered the test and this is what the test brought to light:

The little brown cow he offered to sell for $50 made 6,383 pounds of milk, an average test of 5.2 per cent and from the 333 pounds of fat she produced he made a net profit of $48.01 for the year. The black and white he refused $75 for made 4,366 pounds of milk, tested 3.4 per cent and from the 148.9 pounds of fat she produced made him a net profit for the year of 38 cents. In other words, he milked this cow a year for 38 cents and the other one for $48.01. To use Mr. Bebling's own expression, "The little $50 brown cow doesn't leave the barn now for less than $100; the black and white cow is for sale at $50."

An argument for pure breds was made by Princess Maude Mechthilde, a nine year old, from whom the owner has sold $1,540 worth of stock and has a heifer valued at $500 on hand.

The herd records for the year show that the average profit per cow for the thirty-one herds was $33.61, average milk production 6,750 pounds, average fat 258 pounds, which is considerable above the state average. Following are the herd averages, which are worth studying. These averages include only cows in test for the entire year and by comparison with these herd figures farmers can ascertain the value of their own herds:

Herd No.	Age	Lbs. milk	Lbs. fat	Profit	Breed
1	4	11180	472	$63.93	R. H.

FARMER AGENTS write for 1916 agency for Diddie-Blitzen Rods. Best Lightning Rod sold. L. F. Diddie Co., Marshfield, Wis.

Washington County Breeders.

"Cow Day" Inaugurated by the Holstein Lovers Brings Out Big Crowd at Gathering at West Bend.

WASHINGTON county Holstein breeders, who recently organized the Washington County Holstein-Friesian Association, have started their work with an enthusiasm that should make it one of the best community organizations in the state. This was demonstrated recently when farmers and dairymen, on invitation of the association, crowded the commercial club rooms at West Bend to overflowing. The occasion was known as "Cow Day" and was the first meeting held by the association since the organization meeting. The business men were well represented, which showed the co-operation between the commercial and the farming interests and the presence of many women at the meeting proved their interest in the cause of better dairying.

J. P. Riordan, of Mayville, former president of the Wisconsin Holstein-Friesian Breeders' Association; Chris Schroeder, of Racine, the present state secretary, and F. W. Bucklin, of West Bend, an attorney, were the principal speakers. The meeting was called to order by Walter Schroeder, president, who explained the purposes of the new association, which is organized both for sociability and business. Such an association, he said, would enable breeders of Holstein cattle in Washington county to get the money their stock is worth and will do much toward improving conditions on the farms and in weeding out the boarders. John W. Gehl, secretary, cheered the members by reading a letter from a distant buyer who was in the market for a carload of Holstein heifers. The association, he pointed out, could handle such inquiries by the members listing their stock. In this way buyers for car lots would come to a county where a strong association is in existence, for they could fill a car quick and at smaller expense than where they go into unorganized counties and must visit every dairy farm in the county in order to make up a car lot.

Mr. Bucklin took as his subject the "Business Man's Interest in the Dairy Cow."

He mentioned the encouragement which the plan of organizing a Holstein breeders' association found with the local commercial club. An organization of this kind should not be confounded with a monopoly. The times when business men were prejudiced against farmers are past. It is the business man who gains when the farmers of the surrounding country prosper. It is in the interest of the business men of all sorts to see that the farmers of the neighborhood do well. If the farmers take in more money they will spend more, the standard of living will be raised, for we all have desires for better things, for things that we cannot hope to get with a small income. Every storekeeper will feel the prosperity of the farmer. And finally, when people fall all over themselves in hauling in money and get hurt, the lawyer even will come in for a little share in the "flush times," the speaker added jocularly. He also touched upon the marketing problem, the low price which the farmer gets for his produce and the high price which the consumer has to pay, and the waste which goes with our poor system of marketing, one section of the country getting much more than it needs, and another not enough. In this, the speaker declared, we are twenty-five years behind Germany and other European countries. Marketing of produce is not only a community affair but a state and national affair. He also expressed as his opinion that business men should join the breeders' association and gave an instance, taken from a paper, in which business men of another city financially helped breeders to acquire pure-bred cattle.

Mr. Schroeder told of the splendid results being obtained in other counties through co-operation and community organizations and invited those present to become members of the state association.

Mr. Riordan spoke on his favorite theme, "Why We Should Raise More Holstein Cattle." He is a Holstein admirer through and through. He is a Washington county boy, although now a resident of Dodge county, but he demonstrated that his heart was still with the home county.

He advised his listeners to go into Holstein cattle breeding with the Washington county spirit. He then related how dairying is helping Upper Wisconsin, where they have not so many acres to a farm, but two-cow farms, ten-cow farms, etc. Wisconsin land is not as favorable to agriculture as land in some neighboring states. The speaker said that he is not particular as to cows of any strain. Holstein cows are much attacked by publi tions devoted to other breeds, but Wisconsin has cast her ballot for the Holstein cow. There are two Holsteins for each Guernsey in the state, and more for other kinds. Five thousand farmers in the state today say that Holstein cows are the best. Mr. Riordan gave some of his experience on the large farms near Mayville. When he took charge of them the soil was worn out and its fertility had to be restored by the cow, by manuring the impoverished soil. Referring to Holstein cows, the speaker gave their characteristics as phlegmatic temper and absence of nervousness. They do not fuss much about the milker and can stand much more than other kinds of cows. They are in big demand and sell fast. The pure-bred Holsteins give more milk and cheaper milk than any other cow.

NEW SHORT-HORN VOLUME

American Short-horn Breeders' Association Starts Paper.

Under the title "The Short-horn in America," a new publication has made its bow to stockmen of the United States. This is to be published monthly under the auspices of the Short-horn Breeders' Association, with Frank D. Tomson at the editorial wheel. It is the purpose of this publication to supply breeders as well as the agricultural press with accurate and useful information pertaining to the Short-horns. It will chronicle from time to time all important events relating to this important breed and it will be edited with the thought in mind that eventually it will become a history upon which future generations may safely rely.

It is not the purpose of the American Short-horn Breeders' Association to profit by the publication of this journal, but rather to stimulate interest in this great breed. Mr. Tomson's long experience in the practical work of breeding and his wide knowledge of Short-horn affairs will inspire confidence in this new publication from the very beginning.

The first volume contains contributions from men who are well known by the breeding fraternity. The writers include ex-Secretary F. D. Coburn, of Kansas; Col. F. M. Woods, Prof. C. F. Curtiss, Robert Miller and Geo. E. Martin. All in all the first volume of this publication reflects only the highest degree of credit upon those connected with it and without doubt or question it has an important mission to perform in the encouragement it will furnish to breeders in general to engage in the raising of improved live stock Day by day it is getting harder for the scrub to exist and if those who are in charge of this new publication have their way the scrub will be relegated to utter oblivion.

KING EIGHT CYLINDER

Every dollar planted in this big powerful Eight will return many miles of *matchless* riding satisfaction

Here is a printed "demonstration" which the local King dealer can make a fact

FLEXIBILITY—INSTANT "GET-AWAY"

With seven passengers can be throttled down on "high" to two miles per hour. At this "creep" one can walk alongside, raise hood and examine engine. Small bore long stroke cylinders with extra large valve ratio, combined with a perfectly balanced crankshaft and fly-wheel, explain this extraordinary performance. A touch upon the accelerator and the car is away at a racing speed.

ACCELERATION—HIGH SPEED

From two to sixty miles an hour without gear changing, vibration, or noise. We believe the King gathers speed with greater rapidity than any other car on the market and all accelerometer tests support this opinion. Eight cylinders, aluminum pistons and large valves help make this possible. Engine gives nearly 3000 R.P.M

HILL CLIMBING ON "HIGH"

An unperfected experimental car of this model ascended the famous three-mile twisting hill of Uniontown, Pa., on "high" with six passengers, average weight 176 lbs. Slowed down to 5 miles per hour and accelerated to 35 on steepest part of grade. With two passengers made these three miles in four minutes and forty-one seconds with full touring equipment. Starting from Denver in "high" climbed Lookout Mountain and Genesee Peak, Colorado, without once shifting gears or slipping clutch.

EASE OF OPERATION—COMFORT

The ideal car for women who drive because of little gear shifting—and that little made easy. Steers without effort. Long Cantilever springs of King design give all-day trips an "easy-chair" comfort.

ECONOMY—LONGEVITY

The constant flow of power given by the high-speed eight cylinder King engine permits the use of light reciprocating parts which reduce friction and vibration to a minimum. This results in a most remarkable economy of fuel, oil, tires and repairs and spells a long, efficient life for the car.

In And Around Wisconsin.

La Crosse County Guernsey Breeders Elect Officers For Coming Year—Kewaunee County Dairymen and Factory Operators Meet—Other Interesting Items.

Mr. William E. Rockhill has resigned as manager of the Gustav Pabst stock farm near Oconomowoc.

Marinette county claims the record for the largest calf born to a dairy cow in the middle West. The calf is the offspring of a pure-bred Holstein cow on the farm of Augustine Brothers in the town of Grover, and it weighed 120 pounds at birth.

September 26th-29th has been selected as the dates for the 1916 fair of the Rusk County Agricultural Society at Ladysmith. The amount of premiums in grasses and grains and pure-bred potatoes have been doubled, which is expected to bring out a fine showing.

It is announced that the Benson county, North Dakota, farmers who recently visited Wisconsin, were so well pleased with their trip that they expect to come again in June. The delegation which comes in June will visit stock-raising centers in Wisconsin and northern Illinois.

County Superintendent Ames, of Dane county, has agreed to furnish free corn and tomato seed to pupils of the rural schools who will enter the contest for these products again this year. It is also proposed to conduct an acre corn contest, and $100 in prizes will be divided among those producing the largest amount of Wisconsin No. 7 corn from an acre.

Martin Bonerud, of Moscow, Wisconsin, who was summoned to serve as a petit juror at this term of circuit court, walked seventeen miles to get from Moscow to Dodgeville in time to serve. Owing to the floods, the trains on the Illinois Central were not running and the roads were so bad it was almost impossible to drive through.

Wood county boys and girls will be given a chance to demonstrate their ability in sewing and manual training, the Wood County Agricultural School having put up $24 in prizes for the best articles entered. Entrants must be under nineteen years of age unless enrolled in a country school, and no student in a city high school can enter.

The Kewaunee County Cheesemakers', Buttermakers' and Dairymen's Association held a very interesting meeting recently at Kewaunee with thirty-two members present. Addresses were made by Professor Bullock, of Marinette; J. B. Linzmeyer, of Green Bay; and Dr. W. M. Wochos. On invitation of Senator Perry the next meeting probably will be held at Algoma. A. W. Teske is president of the association and Louis Blahnik is secretary.

The annual meeting of the La Crosse County Guernsey Breeders for the purpose of electing officers and the transaction of other business was held at West Salem, Saturday, April 1st and the following officers were elected: Sherman L. Dudley, president; L. C. McClintock, W. J. Dawson, H. M. Bonsack, K. O. Gaarder and W. Labus, vice presidents; T. H. Champion, secretary; H. M. Bonsack, treasurer; W. D. Sandman, Otto Wolf and H. D. Lovejoy, executive committee. It was decided to hold a summer meeting and picnic. The following were appointed as a committeee to make the necessary arrangements for such a meeting: H. J. Aldrich, H. D. Lovejoy and W. D. Sandman. The advisability of holding a fall sale was discussed and it was voted to leave the question open until the summer meeting. The executive board, after the regular meeting, decided to work out an advertising plan for further developing the breeding of Guernseys in the county, and plans for suitable stationery for members of the association were made. It was also decided that the secretary should issue a monthly sales list, after which a vote of thanks was given to the retiring officers, Pres. Odolph Nuttleman and Sec. Ray Lewis, for their past untiring efforts in behalf of the organization.

Farmers in Langlade county interested in honey production will meet in Antigo on April 18th to form a county beekeepers' association. N. E. France, state inspector of apiaries, has been invited to attend and talk on beekeeping.

A. C. Ellickson, of the town of Arlington, Portage county, won laurels recently on the Chicago market when he disposed of a carload of fat cattle averaging 1,194 pounds at $9.70 per hundred. The commission merchant men said that it was one of the finest lot of steers ever sold on the Chicago market. Mr. Ellickson was formerly a Dane county farmer.

The Waukesha County Guernsey Breeders' Association will hold its annual summer picnic on June 2d at the home of Roy Burton, northwest of Eagle. This will give the breeders the opportunity to visit one of the best Guernsey herds in the county. This meeting will precede the Guernsey sale a few days, as June 7th has been chosen as the date for the sale.

GLEN M. HOUSEHOLDER.
Recommended for county agricultural agent in Rusk county, Wis.

An interesting discovery has recently been announced from the farm products laboratory of the University of Wisconsin. Director Howard F. Weiss believes that a substitute for gasoline has been found. This substitute is made from sawdust at a cost of from 13 to 15 cents a gallon. Director Weiss believes the discovery will revolutionize the gasoline industry. The new product is made from alcohol produced from wood and is claimed to be almost 100 per cent pure.

Rice Lake, Barron county, is assured a condensery, as enough milk has been pledged by farmers within a radius of five miles of that city to keep one busy. The Oatman Company will operate the new plant, which will start with the daily output of about 3,500 cows. Whole milk prices on the basis of 3.5 per cent milk will be paid with an additional premium for higher-testing milk. The condensery is expected to start operations May 1st.

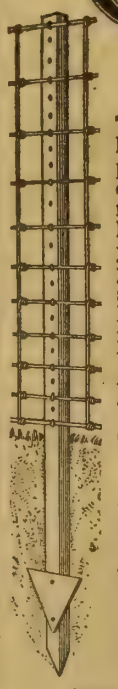
The trout season in Wisconsin, excepting the counties of Ashland, Douglas, Bayfield and Iron, opens on April 15th, and under the new law it is unlawful to catch trout less than seven inches in length. In the four counties mentioned above the season opens May 1st under the new law. September 1st remains the closing date and the limit of forty-five in one day still applies. Bass, pike and pickerel fishing begins on May 30th. Farmers should be careful to observe the provisions of the new statutes, as the state game warden has announced a rigid policy for law enforcement this season.

Dean Albert S. Woods, of the Minnesota Agricultural College, predicts a big year for Minnesota farmers. He reports that fruit, and especially small fruit, in the southern portion of the state is in excellent condition. Some varieties of plums are reported to have been killed, but the outlook is good for apples, and for strawberries, raspberries, blackberries and all kinds of small fruit.

Game Warden John Egan and County Clerk Auton received a request recently from a farmer in Sheboygan county asking permission to keep a pet deer which he had captured near his home. The animal was slightly injured and made little effort to escape. The matter has been taken up with the state conservation committee. This is the first instance on record where a deer has strayed onto a farm and become domesticated. Since the animal has recovered from its injuries it has refused to leave the farm and mingles with the other domestic animals.

County Representative F. G. Swoboda, of Langlade county, and the county superintendent, A. M. Arveson, are co-operating in a calf-raising contest. Prizes are to be offered to the boys making the best showing, and provision will be made at the next county fair for recognizing the contest in the premium list. The same gentlemen are arranging for a potato-growing contest this year. Seed potatoes will be furnished to those who apply. The contest is open to those who have Rural New Yorker seed, or who will secure that variety. Last year Langlade county won the banner at the state show.

Chicago STEEL FENCE POSTS



Can't Help But Save You Money

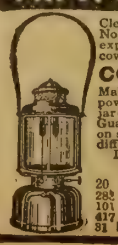
They cost less to install—last a lifetime without repair. They guard your crops from insects that live in wood posts and fence-line weeds. With them you can burn clean through your fence, kill the insects and gain more tillable land. Build your new fence and replace rotting wood posts with Chicago Steel Posts. *Made from same material used in old black wire.*

Guard Your Cattle With These Posts

A wood post wire fence exposes your cattle to lightning. *Wood posts will not ground lightning—Chicago Steel Posts absolutely will.* Let us tell you more about these posts and explain how you can save the price of an automobile.

CHICAGO STEEL POST CO.
Continental and Commercial Bank Building,
Dept. H, Chicago, Ill.

Fill It Only Once A Week



Clean it only once a year. No wick. No glass globe. No danger even if rolled around in straw. Can't explode. Can't spill. Use it around barns, cow sheds, chicken houses, cellars, etc. The

COLEMAN GAS LANTERN

Makes and burns its own gas. Gives 300 candle power of strong steady light. Can't blow out or jar out. Made of heavily nickeled brass, Mica Globe. Guaranteed for five years. Ask your dealer—if not on sale in your town yet, write for catalog of 20 different kinds Gas Lanterns, Table Lamps, etc. Dealers or agents wanted in every locality.

ARE YOU

A Gasoline Farmer?

Power for the farm is a big problem. Some farmers, successful ones, too, use oil-gas, others use steam, and still others use the horse or the mule and say that results are good enough. You pay your money and you take your choice; but whatever the choice,

BE SURE THAT YOUR POWER-PLANT IS RELIABLE

For nothing that you possess will pay you better, provided that you keep it at work and that it will work according to specifications.

Some widely heralded inventions in gasoline-power devices have done everything but *work*.

Others, less widely known, *do nothing but work*. That's just what the Nichols-Shepard Oil-Gas Tractor has done and is doing. It has a five-year record of work accomplished. It has no record of failure.

So, if you are interested in an explosive engine, let us tell you about one that you won't have to mortgage the farm to keep going—one that will saw in the winter, plow in the spring, haul in the summer, thresh in the fall, and pick up odd jobs at any kind of power requirement between whiles. We build this kind of an Oil-Gas Tractor and we guarantee it to be a reliable power producer that *will* work.

Of Course It's a Red River Special

If you have never had experience with an oil-gas engine it may help you to know what neighbors of yours say about ours. Send your name and address to us and say that you would like a copy of the Home Edition of the Red River Special paper issued for your vicinity. We will be glad to take the matter up with you and send a Big Catalog that covers our entire line.

Care of Sow and Pigs.

Farmers who intelligently feed and care for their pregnant sows, so as not to overload them with fat, but instead give them feeds for the development of bone and muscle, are on the right road toward the production of strong, healthy litters. Their preparedness program, however, does not end here.

Two weeks before farrowing the sow should be put into a farrowing pen so that she will become acquainted and contented in her new quarters. The farrowing pen should be dry and free from drafts. Provide the pen with a guardrail made of 2x4-inch planks set eight inches from the wall and eight inches from the floor to prevent the sow from crushing the pigs against the wall. Use only a small quantity of bedding; leaves or straw are preferable. See that the sow has plenty of fresh water.

It pays to keep the sow quiet. Assistance at the time of farrowing should be at hand if needed, but the sow need not be helped if she is getting along well. In cold weather put the newly-born pigs in a well-warmed basket and after farrowing is over the pigs should be placed with the sow, care being taken that each one gets to a teat. When the afterbirth is passed it should be removed from the pen at once and burned or buried.

After farrowing the sow should have nothing but water and a little thin slop for the first day. The feeding for the first three or four days should be light and the time consumed in getting the sow on full feed should be from a week to ten days, depending on the condition of the sow and the size and thrift of the litter. It takes plenty of sow's milk to make healthy, growing pigs. If the pigs begin to scour feed the sow less and give her plenty of strong limewater.

It is very necessary that the little pigs have plenty of exercise and all the sunlight that can be given them.

By putting into practice the essential points above mentioned the number of pigs raised to weaning should be increased. Hogs never fail to respond to good care. Kind treatment always means contentment, with its corresponding profits.

Fair Superintendents.

The staff of superintendents who will have charge of the 1916 Wisconsin State Fair has been chosen, and the list, as announced recently by Sec. Oliver E. Remey, is as follows:

Administration Building—Oliver E. Remey, state fair park.
Admissions—A. H. Jenson, Edgerton.
Agriculture—F. S. Campbell, Three Lakes.
Amphitheater Arcade—D. W. Larkin, Sturgeon Bay.
Amusements—Thomas Saxe, Milwaukee.
Automobiles—B. J. Ruddle, Milwaukee.
Bees and Honey—N. E. France, Platteville.
Cattle—H. W. Claflin, Muskego.
County Exhibits—E. L. Luther, Madison.
Dairy—Fred Marty, Monroe.
Department of Health—F. W. Luening, Milwaukee.
Education—George W. Davies, North Freedom.
Forage—E. Y. Hayhurst, Watertown.
Grand Stand—J. S. Miller, Madison.
Grounds—M. J. Sweeney, State Fair Park.
Horses—W. K. Caldwell, Morrisonville.
Horticulture—N. A. Rasmussen, Oshkosh.
Machinery—J. A. Chinnock, Hudson.
Physician—J. Robert Newman, Madison.
Poultry and Pigeons—George W. Hackett, North Freedom.
Privileges—Charles W. Harte, Watertown.
Publicity—Joseph W. Smith, Milwaukee.
Public Safety—Captain W. F. Mehl, Milwaukee.
Purchasing Agent—M. F. Blumenfeld, State Purchasing Agent.
Sheep—Ira M. J. Chryst, Hudson.
Speed—Richard J. White, Milwaukee.
Swine—James Dillon, Mondovi.
Transportation—A. W. Kalbus, State Fair Park.
Veterinarian—O. H. Eliason, State Veterinarian.
Woman's Rest, Playground, Hospital—Mrs. H. E. Stadler, Wauwatosa.
Woman's Work—Mrs. Vincent W. James, Eau Claire.
Young People's Club—T. L. Bewick, University of Wisconsin.

There has been but one important change. Professor Halpin resigned as head of the poultry department and he has been succeeded by George W. Hackett, of North Freedom, a nationally known poultry man.

Ask your neighbor to subscribe for The Wisconsin Farmer.

Fruit and Garden

Annual Flowering Plants.

There are hosts of people who cannot be happy without a good display of flowers. You find them in town and country alike. With many growers, how to get their favorites early is an interesting question. This may be managed easily with some varieties which bear transplanting, but there are other very desirable flowers which will not bear the least disturbance of their roots and such must have the seed sown where the plants are to remain. Among these sensative beauties are poppies, sweet peas, phlox and corn flower, also the balsam and portulaca are best grown by sowing the seed where it is to grow permanently.

But some of these may be sown in the open much easier than others. There is no danger of planting the sweet pea too early, for it does best in a cool, moist climate, and it is an advantage to give it all possible of the cool spring weather. Also, all of the poppy family should be early sown, but the method of sowing seed is quite different from that used with peas. They should be planted in drills an inch deep, but the poppy seed should be scattered upon the surface. If the bed has been prepared in the fall all the better. Simply level it and scatter the seed thinly. Do not try to cover it more than to draw the back of the rake over the surface.

The phlox drummondii is another early bird and its bloom will be more satisfactory if it has the chance for an early start. The balsam and portulaca need not be planted until May 15th, for they need a warm soil and weather and nothing is gained by early planting out-of-doors, neither by hotbed starting.

But there is a long list of the flowering annuals which may, with advantage, be hotbed started. They transplant easily and every day of growth secured in early spring forwards the blooming season that much. Sweet alyssum, asters, marigolds, calliopsis, coxcomb, pansies, pinks, zinnias, stock, nasturtium, snapdragon, etc., with good hotbed space may be sown the last of March. It is always best to sow seed thinly to secure a stocky growth. And after the plants are well started remove to flats, giving each plant three inches of space. There should be about three inches of dirt in the flats. The advantage of this method is that when you are ready to remove to the permanent outdoor beds a month later they can be transplanted without any shock or injury whatever. All you have to do is to cut down between the plants, removing the entire earth, and the plants will never know that they have changed locations.

The varieties which we have named are the standards. They are the ones which give satisfaction. There are dozens of other varieties, all of them more or less curious and interesting, and they will do for purposes of experiment, but the ones named are reasonably sure to do well and they will give you an abundance of bloom both for cut flowers and for garden display.

Interest in Cabbage.

The season of 1916 will mark a revival in the cabbage production of southeastern Wisconsin, particularly in Racine county. The new disease-resistant variety of the Holland type will be planted in large quantities by many of the growers in that section. Through the co-operation of a local committee of cabbage men considerable seed from this resistant type has, during the winter, been distributed among the growers.

Each grower will be encouraged to grow his own seed from carefully selected plants of this Wisconsin Hollander strain. Meanwhile the college of agriculture is working to perfect a disease-resistant kraut strain.

It takes two years to mature cabbage seed in Wisconsin, but in order to save one season selected heads were sent last summer to points in Florida, Texas and Louisiana, and reports from these places indicate that the plants are already in blossom and good yields of seed for planting in Wisconsin in May will no doubt be available.

Control of Cabbage Maggot.

Considerable study has been given at the Minnesota farm to the matter of controlling cabbage pests. This study has been directed chiefly to the control of cabbage and onion maggots. The director of the station issues the following statement, which will be of interest to our Wisconsin growers: In experiments at University Farm last year and the year before this mixture was used for cabbages: Lead arsenate, three-fourths ounce; New Orleans molasses, one-half pint; water, one gallon.

This mixture was sprayed over the plants every week, or twice a week in rainy weather, from the time they were set out until May 20th. For a second brood of the pests the spray was applied from July 1st to 20th.

A spray that has been used to destroy the onion maggot at University Farm is made of: Sodium arsenate, one-fifth ounce; New Orleans molasses, one-half pint; water, one gallon.

Such a solution, however, tends to burn the leaves of cabbages. The barred wing onion maggot is controlled by destroying all old, infested onions in the spring.

The first indication of the cabbage or onion maggots is the wilting of the plant after the pest has attacked the underground parts.

Guaranteed Seed Corn

WE recently sent average identical sample of our Northern Iowa latitude grown and Central Minnesota (Redwood Co.) grown seed corn to the foremost agricultural college of this country and have just received their official report, as follows:

Nor. Iowa lat. grown.		Cen. Minn. (Redwood Co.) grown.	
Wimple's Yellow Dent	97%	Northwestern Dent	96%
Iowa Gold Mine	96%	Wis. No. 7 or Silver King	92%
Goddard's Sil. King	94%	Minnesota King	96%
Reid's Yellow Dent	97%	Minnesota No. 13	88%
Minnesota No. 13	90%	Minnesota Early White Dent	73%

The above tests prove that our stocks of genuine NORTHERN GROWN Seed Corn are the highest qualities you can buy—regardless of price.

We Give You a Sworn Statement as to Where Our Seeds are Grown

We do not handle any dent corn from either central or southern Iowa, Nebraska, Kansas, Missouri or Illinois, as such seed, although of good germination, cannot ripen and mature in the north. Look at your map. **Don't buy seed corn that is grown south of you.**

We GUARANTEE every bushel of Seed Corn we ship to be exactly as represented in every particular or money refunded.

Get our FREE catalog at once and send your order promptly if you want any of the above lots.

UPPER WISCONSIN

Farming Pays in Douglas County.

In a letter recently made public Mr. W. H. Webb, of Superior, Wisconsin, answers the question, "Does Farming in Douglas County really pay?" His answer is an emphatic "yes." He remarks that the trouble with a good many of the visitors to this county is they rarely go outside of the city of Superior. This gives them absolutely no opportunity to judge of the wonderful development among the farmers of the county. Mr. Webb further charges that the bankers of the city of Superior do not take the trouble to acquaint themselves with the agricultural development of their county. He says that he could furnish the names and addresses of hundreds of farmers in Douglas county who are not only earning, but also saving thousands of dollars each year.

Seven years ago the two Christensen Bros., at Wentworth were worth less than $1,000 together, and today you could not buy their farm for $30,000 over and above all indebtedness. They have cleared nearly $5,000 a year over and above their living and all expenses. There is not an acre of improved land around Poplar or Foxboro that can be bought for $100 per acre. Ten years ago these lands were bought for $5 to $10 per acre. The difference of at least $90 per acre has been so much clear profit to the men who have lived on and cleared the land—besides a good living for themselves and family, and these lands are paying at least 25 per cent per annum on the valuation of $100 per acre.

Mr. Vaughn and Mr. Jacobs, of Poplar, recently paid $10 per acre—including unimproved as well as improved land—and they would not sell now at that figure.

Mr. Webb suggests those interested ask Schmidt Bros. or Sigmund Haidacher or a dozen other Foxboro farmers what they will take for their farms and whether farming pays or not.

Last year Mr. Webb harvested forty acres of oats near Brule—on new breaking—that paid the entire cost of the land, paid for the clearing, breaking, disking, sowing, harvesting, threshing and marketing the crop, and something besides, and that same land today is actually worth $100 per acre because it will pay a handsome net rate of profit on that valuation over and above all expenses.

Rutabagas in the Ration.

Mr. Ottos H. Bergh, of the Grand Rapids, Minnesota, experiment station, is advising the use of rutabagas as a substitute for corn on newly cleared land. He finds considerable land on which corn for silage is not a certain crop. He says that as a succulent feed for dairy cows, young stock and hogs, a twenty-ton crop of rutabagas is equivalent to a twelve-ton crop of corn. By introducing clover hay and oats a well-balanced ration may be maintained. Twenty pounds of clover, fifty pounds of rutabagas and six pounds of oats make an ample daily ration for a cow giving thirty pounds of milk containing 4 per cent of butter fat. From fifteen to twenty tons of roots to the acre is the average yield in northern Minnesota on well-manured land, so an acre yield, on the average, will provide fifty pounds daily to each of three cows for seven or eight months. Mr. Bergh's observations are applicable to many points in Upper Wisconsin. He advises planting rutabagas in June. The seed bed should be thoroughly prepared. One and one-half pounds of seed will sow an acre, and seed can be bought in northern counties at from 50 to 75 cents per pound. An ordinary grain drill with a grass seeder attachment is a good machine for sowing.

Three out of every four holes should be stopped up in a seven-inch drill. This will make the rows twenty-eight inches apart. In a six-inch drill, four out of every five holes should be stopped. The seed drill can then be set as for clover seed, of course setting it for four or five times the amount indicated on the register, as only one-fourth or one-fifth of the holes are left open.

The plants may be thinned with a hoe. A strong plant at from every nine to twelve inches will give the largest yield. Cultivation should be like that of potatoes. When ready to harvest the tops may be cut off with a hoe and the roots dug up with a potato digger.

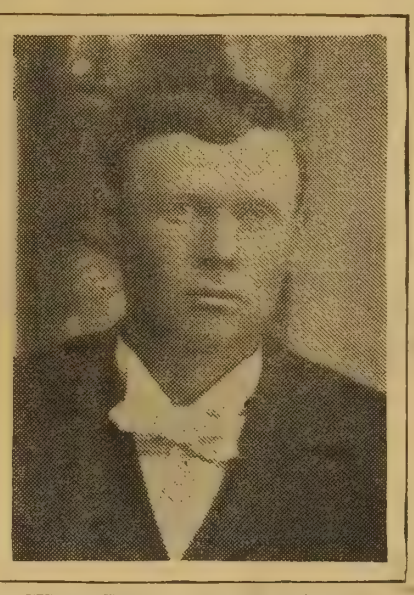
The roots may be stored in a cellar or root house, which saves the expense of a silo.

The dairymen of Denmark and neighboring countries grow little corn, and depend largely upon rutabagas for feed for their herds. Young animals wintered on rutabagas make faster gains when turned out on pasture in the spring than stock fed on grain.

Corn Experience in Upper Wisconsin.

To the Editor:—Would be pleased to give you some of my experience in growing corn:

First, I bought eighty acres of heavily timbered land, mostly maple, some rock elm and butternut. We took off from 9,000 to 10,000 feet of saw-log timber to the acre and about ten cords of body maple cord wood. I moved ten acres of this timber in the winter of 1913, and in the spring we cleared the land all up and burnt everything clean by the 16th of May and planted my first Yellow Dent on that date. I didn't have time to drag with a spring-



CHAS. HULL, TIGERTON, WIS.

tooth harrow. I thought I had better get the corn in, as it was very warm. We took three round poles, two inches in diameter and eight feet long, and peeled the bark off and set them in line to plant by. As we approached each stake we set it over four feet. By doing this we got our rows straight enough to use a spring tooth cultivator and one horse. This is new-land farming in Upper Wisconsin. The ground sloped to the south and the soil is a deep, black loam. My corn was ripe by the 10th of September and it went 122 bushels to the acre.

The next year, 1914, I did the same thing—planted on new land that's logged off in the winter—and got 138 bushels per acre of the same kind of corn, planting on the 16th of May, and my corn was ripe enough to pick seed from on September 3d.

Last season I did the same, but planted on the 12th of May. It was ripe about the 12th of September, and some of this crop was what I sent to Madison for exhibition. I got 100 bushels to the acre this year and took third prize in the state for No. 8.

In selecting my seed I have selected just the very prettiest cylinder-shaped ears, as they ripen quicker than the larger, stubby ones.

It is hard work to farm new land, but I sold lots of seed corn and had a good crop of everything. Had lots of strawberries. Everything grows good here if you take care of it.

Shawano Co., Wis. Chas. Hull.

MONTANA

Your Opportunity State Thirty Million Bushels

—of grain was produced in Montana along the Great Northern Railway in 1915. Six years ago this same territory produced only Five Million bushels.

Big facts that make you realize that Montana *leads the world* in rapid development of farm lands. What is more, Montana leads in *quality* of grain produced—was awarded the Grand Prize on Exhibits of Grain over all the rival nations — over every other state — exhibiting at the San Francisco Panama-Pacific Exposition—winning a total of 513 medals.

Learn More About Montana

Then you will understand the wonderful tide of immigration to the Agricultural Treasure-State where every furrow is a pay streak for the profit-seeking crop-raiser. U. S. Land Commissioner, Washington, D. C. reports more than Twenty Nine Million acres Government and Indian lands in Montana disposed of to settlers in the past six years. During the past fiscal year, over Twenty Three Thousand original and final homestead filings have been made in that part of Montana reached by the Great Northern—a record absolutely unequalled by any state, in the operations of the General Land Office.

The homestead lands of agricultural value in Montana are going fast, but you have remarkable opportunity to purchase deeded land at very low prices. Come to the great, new, golden Montana country. Rich soil, favorable climate, convenient market and good prices for all you grow. Get the information—then decide for yourself. Send coupon *today* for

FREE — Montana Bulletin

Illustrated and fully descriptive, with experience-letters from settlers—affidavits of crop yields and information concerning opportunities offered home-seekers. **Special Low Fares for Home-Seekers.** Please use coupon.

Studying the Potato.

R. A. Kolb, agricultural agent for Taylor county, has planned a series of illustrated talks in the rural schools during April and May. The boys and girls will be asked to learn such important facts as vine and tuber characteristics, seed stock which is disease-free and which conforms to Rural New Yorker type requirements, and the best methods of fighting the common potato diseases.

Four Feet of Snow.

Records kept by H. A. Dimock, a pharmacist at Ladysmith, Rusk county, show that during the past winter about four feet of snow fell in that neighborhood. The heaviest snowfall was on February 8th, when the total was six inches. Six inches of snow also fell between the 10th and 12th days of February. February had the heaviest total fall of snow.

Feeding Cattle in Rusk County.

Gus Mitchell, of Rusk county, has arranged to ship 400 head of cattle from Chicago to his ranch north of Ladysmith. These cattle will be fattened and returned to the Chicago market. It is the understanding that Mr. Mitchell is doing this work on a commission basis and dealing directly with one of the largest packing firms in Chicago. On this basis, as reported, Mr. Mitchell makes no outlay of capital, and if this system is found to be satisfactory it may open up a new industry for Upper Wisconsin farmers.

Farmers Store Burned.

A farm store at New Auburn was recently burned with a loss of $23,000, including building and stock. This was one of a string of stores operated by the Farmers' Store Company at Bloomer, Chetek, Cameron, Sand Creek and New Auburn. Steps have been already taken to build a modern new building at New Auburn. The new store will be practically fireproof.

Pull Out Stumps With the Famous Hercules!
Triple-Power

Pull an acre or more of stumps a day. Pull any stump in 5 minutes or less. Don't have loafer land when it's so easy and cheap to *pull the stumps out!* Make 1000% profit by using the Hercules. $1281.00 the *first year* on 40 acres! $750.00 every year after. Let us *prove* it.

Low Price and Book Free!

Get the facts. Read our book. Tells what all steel, triple power means. Shows many features of the Hercules. Shows many photos and letters from owners. Postal will do.

DAIRY

Advice on Raising Calves.

The calf should be left with its mother for the first two to four days so that it may get the colustrum or "first milk." From then until it is four weeks old it should be fed from two to five pounds of its mother's milk three times a day. Experienced breeders feed calves which are weak a smaller amount, but give it oftener. There is more danger from overfeeding than from underfeeding a young calf. Have the pails clean and the temperature of the milk as near as possible that of the freshly drawn milk. This advice and many other important pointers in the raising of better dairy calves are made public in a Wisconsin College of Agriculture bulletin recently written by G. C. Humphrey and W. E. Markey.

During the fifth week change gradually from whole to skim milk. Do not increase the amount fed until about the eighth week, when the calf needs from six to ten pounds twice daily. Froth, which rises on separator milk, should not be fed to calves. It is almost sure to produce indigestion, bloat and scours. If available, skim milk can be fed profitably until the calf is a year or more old. In order to get the greatest returns from the milk the amount fed to any calf should not exceed twenty pounds a day. Corn silage, free from coarse corn and butts and fed in small amounts, makes a good feed for calves which are a month or six weeks of age.

When the calf is from ten days to two weeks old give it a small amount of choice mixed, clover or alfalfa hay. A little later give a very small amount of grain and increase the allowance gradually as the young animal develops. It is well to keep a calf a little hungry, rather than to tax its digestive organs. A calf's appetite and the condition of its bowels are the two arms to the guide post which mark the course the feeder should follow.

Prevent young calves from eating coarse butts of fodder or cobs from silage, as these will cause serious indigestion and scours. Nothing of this kind should be left in the feed or bedding. Occasionally a craving appetite for hay and straw results in too much being eaten and indigestion follows. In such cases separate the ailing calf from its mates and reduce its feed until the appetite becomes normal.

THE DELICATE AGE.

First four weeks when care should be exercised to keep the calf clean, comfortable and thrifty.

The calves should be separated and penned in groups according to their ages. They can be fastened in

SKIM MILK AGE.

There should be a gradual change from whole milk to skim milk.

stanchions when milk is fed and grain can be supplied them immediately after they drink. Feeding the grain at this time and keeping them locked in the stanchions until the grain is eaten helps to overcome the habit of sucking. Calves that continue to suck one another after being turned loose should be separated or some other means taken to prevent the practice. Heifers often have their udders injured by being sucked.

A good grain mixture for young calves consists of fifty parts of whole oats, thirty parts of wheat bran, ten parts of corn meal and ten parts of oil meal. After calves are six months old less grain will be wasted if it is ground. The amount of grain fed should vary from a small handful for the young calf to three pounds, or possibly more, in some instances, to heifers from twenty-four to thirty months of age. If for any reason a heifer is thin an extra amount of grain should be fed to get her in good condition.

SIX TO FIFTEEN MONTHS.

An often neglected stage in the calf's life.

During the first year feed the calves regularly in the barn and turn out for exercise in shady paddocks, or during the nights only. This will insure satisfactory growth at an age when it may be secured at lowest cost. Supply water and salt to the calves daily.

During their second year feed or pasture the heifers in such a way as to get the maximum growth. It has been found that the most productive and profitable cows are produced by getting the maximum growth from birth to maturity. Heifers which are bred at from sixteen to twenty months of age and that are in good flesh at calving time usually develop satisfactorily.

Calf pens should be kept clean and comfortable. The calves should be protected from cold cement floors by board overlays. Cold drafts of air often prove fatal and should be carefully avoided. Abundant window space lets the sunlight in during winter and in the summer can be darkened to keep out flies and heat. The stable needs ventilating so as to supply fresh air and to regulate the temperature. Young calves should never be exposed to a hot, burning sun. Watch the calves carefully and whenever necessary treat them for lice and ringworm.

THE BREEDING AGE.

Fifteen to twenty months. Do not breed younger than fifteen months.

Where skim milk is not available for feeding purposes calves are very likely to suffer and make an unsatisfactory growth. However, if care be taken calves may be grown successfully without skim milk.

In one of the prominent cheese districts of Wisconsin it is an interesting fact that very few calves are fed whey. The whey is fed to pigs and the calves raised on whole milk, oil meal gruel and hay and grain. The usual practice is to feed whole milk regularly until the calf is from four to six weeks old. Then a tablespoonful of oil meal, thoroughly cooked, is added to a pint of water and substituted for a pint of the whole milk. Every third day following an additional pint of water and a tablespoonful of cooked oil meal is substituted for a pint of the whole milk until half the milk ration consists of oil meal and water. This half-and-half mixture is usually continued until the calf is from three to four months old and able to do well on the ration of hay and grain.

In a prominent condensery district a breeder of fine Holstein cattle who gets splendid size in his cows feeds whole milk until the calves are twelve weeks old and then depends on whole oats, hay and pasture. In all instances calves should be encouraged at as early an age as possible to eat grain and hay. Oats alone, or bran and oats, or a mixture of fifty parts oats, thirty parts bran, ten parts oil

Settle the Silo Question

—and settle it for good. Do away with repairs, with tightening of lugs and adjusting of hoops. *Know* that your silo won't blow over. Be sure of perfect silage at all times. Build the worryless, efficient

Permanency and Prosperity—Natco Silo, 18 x 36 and Natco Barn, 40 x 150, on High Hill Dairy Farm - Pulaski, Pa.

Natco Imperishable Silo
"The Silo that Lasts for Generations"

Its hollow, vitrified, clay tile are impervious to air and moisture—they preserve the silage *sweet* and *juicy*. The dead air spaces in the wall resist frost—making it the silo for severe climates. The continuous, reinforcing bands laid in the mortar hold it in a grasp of steel. It is a silo of *efficiency*, and a silo you'll be proud of. Send for our silo catalog describing it fully. Also get our splendid new book, "Natco On The Farm," describing other farm buildings made of Natco Hollow Tile and just as efficient. Both books free. We have many farm building plans to submit, and will help you solve your building problems, free. What are you going to build? Let's hear from you. Write today.

ALBAUGH-DOVER CO. (ID)
2158 Marshall Blvd. CHICAGO

No. 6½

meal and ten parts corn meal make a good ration. Hay of fine quality and preferably well-cured second cutting of clover or alfalfa should be fed. Pure, fresh water should be supplied daily. Calves should have free access to salt at all times and everything should be done to provide clean and comfortable quarters.

If whey is used for raising calves it should be sweet and clean and fed at about the temperature of freshly drawn milk. Each patron of a cheese factory should have special cans for getting as much whey each day as will be needed for the calves and have these filled directly from the cheese vat. Whey from the general whey vat is likely to be sour or otherwise unfit to feed to calves. Sweet whey should be fed only after the calf has been well started on whole milk.

One man reports good results from feeding sweet whey and shelled corn. If a handful of shelled corn is thrown into the whey the calf soon learns to eat this immediately after drinking the whey. Whey, shelled corn, good hay and pasture, when in season, together with good care, gave good results for this stockman.

Good judgment must be used in feeding the calf when it is very young. Have feeding buckets clean at all times. To keep the calf healthy and growing feed at regular intervals and increase or change the feed gradually. With all the knowledge that can be gained from reading the calf feeder must profit by experience and learn as soon as possible what system of care or feeding will under his conditions produce the best results.

Good Record by Grade.

The Wisconsin Farmer presents herewith a reproduction of a kodak picture of a ten-year-old grade cow. This cow was second best in the report of the Eau Claire County Cow-Testing Association No. 2. The

TEN-YEAR-OLD GRADE COW OWNED IN EAU CLAIRE COUNTY.

record covered the year 1915. This grade produced 452.9 pounds of butter fat from 9,224 pounds of milk with an average test of 4.91 per cent. This same grade Jersey has three daughters in the same herd that produced as follows:

	Age	Lbs. milk	Test	Lbs. B. fat
No. 1	7	6948	4.79	333.2
No. 2	6	7057	5.76	406.6
No. 3	4	7394	4.64	343.4

This record goes to show that this cow is not only a good producer but she is also a reproducer.

Waukesha Jersey Breeders Meet.

The annual meeting of the Waukesha County Jersey Breeders' Associatoin was held at the Fountain Inn Hotel, Waukesha, on Friday, March 31st, with about thirty enthusiastic Jersey breeders present. The forenoon was devoted to the business session which was followed by a banquet at noon and a speaking program.

William Peffer, of Pewaukee, was elected president at the annual election of officers and Julius Ries, of Brookfield, was honored with re-election as secretary. George Elliott, of Templeton, was chosen first vice president; Miss A. E. Fintell, of Genesee, second vice president, and William Knight, of Eagle, treasurer.

F. F. Showers, of Delavan, president of the state Jersey Breeders' Association, was present and asked the Waukesha county breeders to issue an invitation for holding the state convention this summer in that county. Delavan had been suggested by the Walworth county breeders, but he desired an invitation from Waukesha county and such an invitation was issued. It is proposed to hold the state meeting in late June or early July and Mr. Showers said that the association directors expected to hold two meetings—one in the southern part of the state and the other in the upper half of the state, probably Waupaca, Eau Claire or some other point, on the following day. The Waukesha breeders in inviting the state association also asked permission to hold the convention at the Fewacres Farm of Frederic Underwood, which can be reached by street cars. Final decision will be made by the officers of the state association.

Mr. Showers filled the place on the program assigned to H. C. Taylor, of Beloit, who was unable to attend. Mr. Showers, with forty-seven head of Jerseys on a forty-acre farm, made a rousing good Jersey speech and praised in glowing terms the enthusiasm now being shown by Jersey breeders who are determined that she shall come into her own. The state association, he said, is growing rapidly and he expects the coming conventions to be the largest and best ever held.

J. R. Danks, of the college of agriculture at Madison, followed Mr. Showers with an enthusiastic Jersey talk. He declared that she can produce milk as economically as any cow on earth and that one reason she had not kept pace with the other breeds was that her owners were too contented and too easily satisfied. Mr. Danks spoke of market conditions as they affect the Jersey and said that the Southwest and other sections where the Jersey seems ideally adapted are in the market for pure-bred stock and that Wisconsin will get its share of this trade when the Jersey men acquaint the buyers with the quality of Wisconsin Jerseys. Wisconsin had just as well be the producer of foundation herds of Jerseys for other communities as Holsteins, Guernseys and others, he said.

The association approved the action of Mr. Ries in offering a pure-bred calf to the winner in the Waukesha county calf contest which closes August 31st. Each of the associations are offering a bull calf and twenty have so far qualified in this contest, the prizes in which go to the youngsters raising the calves the most economically. S. A. Baird, representing the Holstein association, explained the status of the sales pavilion which is to be built and completed in Waukesha before June. All the breeds are interested in this pavilion. Musical selections and the presence of many women boosters of the Jerseys at the banquet served to make an already enjoyable meeting all the more successful.

The Beaver Storm-Proof Silo

STANDS like an oak. Our eight cross rod anchor system and double angle iron inner hoops, top and bottom, together with self-adjusting hoops, make our silo non-collapsible when not in use.

For the past ten years thousands of satisfied farmers have been using the Beaver Silo. Now why aren't **you?** Write for circular "F."

A. V. HINMAN
Protected by Basic Patents

R. L. HINMAN
Hinman Principle Proved by 8 Years' Success

OUR first shop was on our Stockbridge, New York, farm. There, with ordinary tools, our first machine was made to work satisfactorily. 1911 found us with a well equipped machine shop in Oneida—devoting our time to the perfecting of details.

FROM the first we have worked on the principle of a Valve Chamber in pail cover—and to make and break air pressure by an individual pump connected to Valve Chamber by air hose. We thus did away with complications of compressed air tank and pipe line and saved over one-half the cost.

OUR plant has been doubled three times. Today we are turniug out 500 machines a week. This alone is evidence that the *Hinman Milker* is right. Our practical farming and dairy experience has enabled us to solve the milking problem. Hardly a day passes but that we receive expressions of deep regard from the dairyman who found that the

HINMAN MILKER

has made it possible and profitable for them to remain in the dairy business.

Write us your requirements and we will advise you to the best of our ability. We will not advise a larger outfit than you really need, or a smaller one than you can use to advantage.

We have an outfit at a price that we know will pay for itself in a short time.

It is *SIMPLE, DURABLE and EFFICIENT.*

SEND COUPON FOR FREE INFORMATION

Out of our experience as dairymen and with our eight years' success selling **HINMAN** Milkers, we can advise you about size of equipment that will handle your dairy economically.

Proof Against Wisconsin Weather

The Wood Tire Hollow Wall Silo prevents freezing, even when the mercury ranges from 20 to 30 degrees below zero, except sometimes a very little. It is built on a new (patented) principle which gives you a *real building*, so rigid and strong that it will resist storms and be as permanent as your house or barn. Moreover, it is easy to erect as it forms its own scaffolding. No guy wires needed—no hoops to keep adjusted—no staves to shrink or swell, but a continuous, smooth, double wall with a 3¾ inch air space from base to roof, the inner wall being of *California Redwood.*

GUARANTEED FOR 20 YEARS
"But Lasts a Lifetime"

Hundreds of Wood Tire Silos are in use in Wisconsin and neighboring states, perhaps one near where you can examine it and talk with the owner. Not a single one has ever blown down or even racked out of plumb. All give perfect service. If you are planning to buy a silo, send at once for our folder which shows how they are built. A postal brings it to you by return mail. Write today. *Agents wanted.*

Internal and External Cleanliness

Vigorous Action During the Spring Months in Cleaning and Disinfecting Will Cut Down Losses From Diseases.

CLEAN up and keep clean" might well be the slogan of every corn-belt stockman. The sentiment of such a slogan applies alike to sheds, stables, barns, yards and pens, and even the thrifty housewife might not be averse to appropriating some of the sentiment as she performs her daily tasks.

The matter of preserving good health of farm animals always forces itself upon the special attention of stockmen during the spring months. This is partly due to the fact that new-born animals have to be dealt with at such a time. The bawling of calves, the squealing of pigs and the bleating of lambs, these are the sounds that greet the stockman's ear during the spring days. If there is health and strength and vigor among the new-born, then there is harmony in the chorus, but if weakness, ill health and contagious disease find foothold, then every squeal or bawl or bleat is a rasping discord on the nerves of the stock owner.

Formerly the law of luck or chance played an important part in the live stock program, particularly as applied to the control of disease. Men were helpless because they did not understand the nature of the ailments the farm animals were heir to and it was consequently uphill work to save the day against the spread of many forms of contagious diseases. Vast changes have taken place in this regard and every stockman today is more or less familiar with the theory of germ life. With the spread of knowledge there have been introduced new and efficient means of combating dangerous forms of contagion and the stock farm is badly equipped and very much out of date today that is not stocked with disinfectants and antiseptics, together with appliances and equipment for the utilization of these products in the most effective way.

THE HOG YARDS SHOULD BE DISINFECTED.

GOING AFTER THE ROOSTS AND DROPPING BOARDS.

FENCES AND WALL SHOULD NOT BE OMITTED.

Stables are frequently given a regular old-fashioned housecleaning. Old litter is removed and worthless rubbish destroyed so that the walls, floors, mangers and stalls can be completely and thoroughly disinfected. The hand spray pump has lightened this task and the inexpensive coal-tar product has become a most effective agency in destroying dangerous forms of germ life. The coal-tar products, while possessing powerful disinfecting qualities, are, at the same time, not in the least injurious to the skins or coats of farm animals, so that in sousing the walls and floors it is frequently the custom to give the animals themselves a going over, thereby destroying lice, mange and other skin parasites and diseases.

It has been demonstrated over and over again that hog cholera can be stamped out and kept out by a system of yard and pen cleansing and by thoroughly disinfecting accompanied by the sensible use of serum. Cholera is without doubt a germ disease, although the specific organism responsible for the enormous loss from this disease has never been isolated by the scientists. The use of disinfectants, however, indicates that whatever the agency is that is responsible for spreading the disease, it succumbs to the attack of the spray pump when the right ingredients are utilized in plentiful supply. Stockmen who are making the most conspicuous financial success are invariably strong believers in the principle of yard, pen and stall disinfection. Around the hog quarters they are most painstaking in the care they give to the feeding utensils, barrels and troughs. Lime is used freely in yards and around feeding quarters and not infrequently in drinking water. Indeed, many stockmen place a peck or so of slaked lime in the large drinking trough used by horses and cattle, and they claim it to be so much the better if hogs can have access to water containing a little lime. It has a sweetening effect in the digestive processes and it is never injurious, assert those who have tried the plan.

But there are other enemies whose attack must be watched just as assiduously as the injurious forms of germs. We refer to the internal parasites which are responsible for such heavy losses, particularly among our hog population. It would not be putting the matter too strongly to say that hundreds of thousands of dollars are wasted annually in feedstuffs consumed by animals infested with internal parasites. The hog's nature contributes to this internal infestation, because we all have to concede that

The Tractor For Small Farms

To meet the demand for a reliable tractor for small farms, we are building our famous EAGLE two-cylinder engine in tractor form. You get a perfectly-balanced, compact and *dependable* tractor that hits the hard places and goes through with power to spare—and still works smoothly. And when you put it at threshing, cutting silage or other belt work,

You Get Power—And to Spare

You want a tractor that will give you perfect service for *both* your belt and traction work—one that is built as much for the one purpose as for the other. Safety, convenience, steadiness, simplicity, quick action, perfect control and surplus power make the EAGLE the ideal tractor for the small farm. The EAGLE Valve-in-Head Motor, which gives cleaner combustion and more power than the ordinary type of engine, is one of the secrets of the success of EAGLE GAS TRACTORS.

SEEDS

"Purity Brands" have always been the highest qualities obtainable each year. Hundreds of farmers will not experiment with any other. All seeds sold on absolute guarantee of **purity** and **germination**—being subject to your test and inspection and money refunded if not better than we represent. **Timothy, Clovers, Alfalfa, Mixed Timothy and Alsike, Blue Grass, Millets, Seed Corn, Seed Oats, Seed Flax, Seed Grains,** etc. Samples and prices free on request.

THE ADAMS SEED COMPANY **BOX 50** **DECORAH, IOWA**

the hog's table manners are bad. He prefers clean quarters and he likes a clean feeding ground, nevertheless the hog is continually on the hunt for food and he will find it even if he has to root over all kinds of filth in the finding. This means that the eggs of injurious parasites are taken into the intestinal tract, where they find conditions favorable for their incubation and sooner or later injurious results are in evidence from their habitation of the intestines.

SERIOUS AILMENTS MAY BE AVOIDED BY FREE USE OF THE HAND SPRAYER AND A GOOD DISINFECTANT.

Nature has fortified these pests with effective means of persistence and their dislodgment from the system only comes when they are destroyed. Fortunately, ways and means have been found to kill these parasites without injuring the hog, and with the present high price of feed no man is justified in taking the risk of wasting large quantities of feed by shoveling it to hogs that are infested. There are various means of destroying these pests and these are frequently referred to in the veterinary department of this paper. There are commercial worm remedies upon which stockmen are now placing great reliance. Formerly santonin was used in large quantities, but the price of this product has almost placed it beyond the reach of stockmen, so that more and more men are resorting to the use of other ingredients.

Then, above all else, it must be remembered that there is a close relationship between certain classes of the stockman's enemies, namely, between germ life and parasite life. Individuals can be found here and there who are firmly entrenched in the belief that by a system of proper feeding and care they can build up the constitutions of their animals so that they become immune from the attack of contagious diseases. And there is apparent foundation for their belief, because, in the case of hog cholera, certain individuals in almost every herd seem to possess a natural immunity. It may be due to vigorous constitutional powers and to an inheritance that naturally fortifies them against disease.

The existence of such "immunes" furnishes the foundation of the belief of men who have spent a lifetime raising hogs without having disease on their premises. It goes without saying, however, that this natural immunity can never exist where animals are weakened by ravages of internal parasites. No inherited force can withstand the weakening influences of these pests and when once the constitution is undermined the way is paved for the introduction of the dangerous contagious diseases. Thousands of cases might be cited where a mistaken diagnosis of disease has been made when the blunder has been traceable to the presence of parasites, and what could be more irrational than the practice of using serum and virus on hogs weakened almost to the staggering point by the presence of intestinal parasites? A few days following the treatment the hogs are swept away like stubble before a prairie fire and the loss mistakenly attributed to carelessness on the part of the individual who administered the treatment, or, on the other hand, to the impotency of the serum product.

WARFARE AGAINST GERMS MUST BE CONSTANT.

It is up to the stockman to clear the decks in advance, building up the constitutional powers of his animals by the wise practice of keeping their quarters clean, judicious feeding methods, coupled with sensible and rational use of the proper kinds of internal parasite-destroying agencies. But the greatest of all health-giving agencies comes to the stockman without cost to him either in labor or money. It is the beneficent sunshine. No germ of contagion can exist longer than a few seconds in the presence of sunshine rays and this is why all farm buildings should be planned so that the greater portion of them can receive a sunshine bath some time during the day. There are many reasons why the so-called individual hoghouse has become popular and the chief of these is the advantage that it affords in respect to the admission of sunlight. Not only is it possible to move these houses from place to place but when once removed their old quarters are immediately disinfected by nature. In proportion to wall space there is usually a much greater area of glass in these small houses than in the central hoghouse and what can be more helpful to young stock on a cold day when the winds are bleak from the North or Northwest than to have the kindly rays of the sun bathing the little pigs, the lambs and even the chicks? To shut out the sunshine is to close the door to life itself, and great is the loss that is annually caused among young stock by our failure to utilize in the fullest sense this great life-giving force.

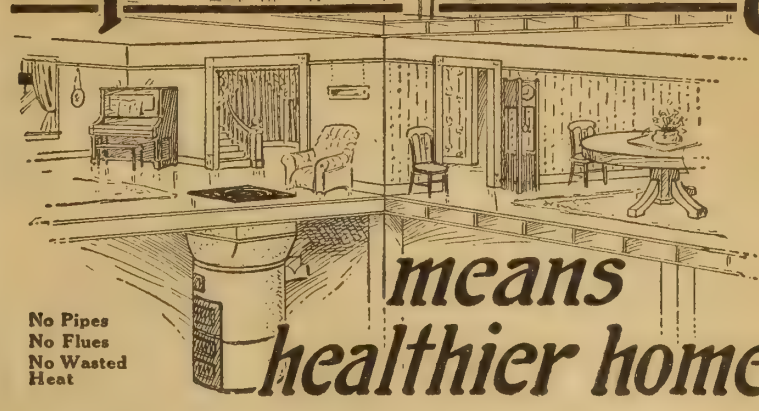
Pipeless Heating



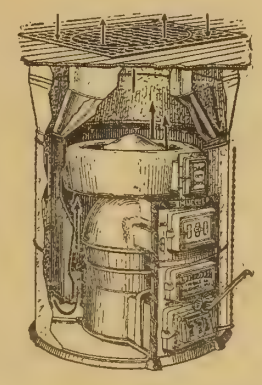
No Pipes
No Flues
No Wasted Heat

means healthier homes

PUT a Mueller Pipeless Furnace into your cellar and watch the difference in your family's health. Dangers of "catching cold" by going from warm rooms to chilly ones will be lessened, for the Mueller Pipeless will keep every room in the house at a comfortable temperature. The constant circulation of air will tend to prevent headaches, colds, catarrh and other ills.

And oh, the comfort of it! No more piling out on the icy floor to build the fire of a zero morning—no more lugging coal in and ashes out—no more of that twice-a-year wrestle of setting up and taking down the stove. No more dirty walls and sooty ceilings. Even heat in every room—and it all comes **from one register**—you don't have the costly, disagreeable job of tearing up your house to put in flues and pipes.

The Mueller Pipeless Furnace can be used successfully in both large homes and small. It is easily installed in any cellar, or can be used in homes having no cellar, simply by digging a pit to place it in. No heat wasted—no spoilage of produce stored in cellar. Easy to run. Burns hard or soft coal, coke or wood.



MUELLER PIPELESS FURNACE

The pipeless furnace that you can depend upon. Real furnace construction—triple jacket, substantial firepot and radiator, best type grates—all doors put where they're handiest. Thousands of satisfied users endorse it.

FARM MECHANICS

Auto, Farm Engine and Farm Machinery Ailments diagnosed and remedies suggested in this department

QUESTIONS AND ANSWERS.

Hitching to Tractor.

Would you please give an illustration of the best way to hitch two drills to a tractor, also a drag behind the drills?

Answer.—There are many different tractors on the market requiring different hitches. It is impossible for us to give you much definite information as to your particular outfit. You should write direct to the manufacturer of your tractor. He will be pleased to give you instructions for making the best hitch possible for his machine.

Repairing a Cracked Jacket.

I have a gasoline engine that has a cracked water jacket. Is there any way in which it can be soldered?

Answer.—It can be soldered if proper care be taken to make the solder stick. File a V-shaped groove the full length of the crack and about half way through the jacket wall. The groove may be chipped out if the wall is quite strong, using a small, sharp diamond nose chisel. It is safer to file it out. After the groove has been made it should be tinned. Keep the groove absolutely free from grease or dirt of any kind. Dissolve a small piece of copper sulphate in water, using as much copper sulphate as will dissolve. Wash the sides of the groove with this solution, which leaves a thin copper plate on the cast iron, to which the solder easily sticks. With a blow torch heat the cylinder jacket quite warm around the groove. Apply some soldering fluid to the groove and with a hot soldering iron rub the solder on the sides of the groove until the sides are well tinned. Then fill the groove with solder. This makes a very good job when properly done.

Ford Magneto Contact.

I have a 1915 Ford runabout. Should the magneto post point come in contact with the magneto cover at the lower end of the point? I have to press the post very hard to set the screws back in place.

Answer.—The spring on the contact point should hold it firmly against the terminal on the coil support. The point must not touch the flywheel housing.

A Gasoline Tank.

I have a heavy threshing engine fender tank. It has some bolt holes and a manhole in it. I would like to use it for an underground gasoline tank. Is there anything or any preparation that will make this tank gasoline tight? If I lay the tank in concrete would it help? How could I make an inexpensive pump? If I give the tank a thick coat of white lead inside would it leak?

Answer.—We would not advise you to attempt to stop a gasoline leak by any mixture, as gasoline cuts nearly all mixtures, including white lead. A small gasoline leak may sometimes be stopped by using common soap as a packing. Obtain some copper plugs for the bolt holes and rivet them over well. Or, tap the holes with a pipe tap and screw in a pipe plug. Use a copper-asbestos gasket under the manhole cover, or a gasket made of asbestos and copper wires.

Some Ford Questions.

I have a Ford car. If I raise one rear wheel, leaving the other on the ground, could I put a belt on the free wheel and run a cider mill from it? How much would a lighting and electric starting outfit for a Ford car cost? What can be done for a car that won't start in cold weather by using hot water on the carburetor?

Answer.—When a car is used as stated above the driving is done through the differential gears. While it might be all right to use the car in this way for an occasional job, the differential would wear out under steady service of this kind. The car would have to be blocked, otherwise it would move forward when the load was applied to the free wheel. Electric starting and lighting outfits for Ford cars can be purchased for about $75.

When starting a Ford car in cold weather give the carburetor dash adjustment a quarter turn to the left, hold out the priming rod which extends through the radiator and then crank as rapidly as possible. In very cold weather hot water on the carburetor is a great aid. As a last resort remove the spark plugs and "prime" the motor with a teaspoonful of gasoline in each cylinder.

Wet Batteries.

I would like to know how to make wet batteries to use on a gas engine. The dry cells cost too much and I can obtain enough zinc and carbon from old dry cells to make the wet batteries. Could I take the zinc from old dry cells and melt it, molding it into a solid block? Does it hurt wet batteries to freeze?

Answer.—For gas engine use you would require three cells, each cell made as described below. Connect the cells in series.

Obtain a glass jar six inches in diameter and eight inches high. The jar may be china or glazed earthenware. Cast a cone-shaped piece of zinc weighing about three pounds and having a piece of No. 8 copper wire running out of the top of the cone. Obtain a porous earthenware cup about three inches in diameter and eight inches high. Place the zinc cone in the cup and pour in enough mercury to cover the bottom of the cup one-eighth inch deep. Fill the cup within one inch of the top with very dilute sulphuric acid and water. Set the cup in the jar and fill the space between the jar and the cup with a solution made as follows: Dilute two pounds of sulphuric acid with four pounds of water, pouring the acid into the water. Dissolve one pound of potassium bichromate in three pounds of boiling water. When cool mix the two solutions and add an equal amount of water.

Having placed this solution in the jar suspend in the solution three battery carbons, connecting the carbons by a copper wire. The battery should stand two days before use. Freezing may crack the jars, but does not injure the electrolyte.

Speed of Auto Motors.

Why is it that the latest Chalmers has more revolutions per minute than other motors? I have read that the Chalmers engine can make 3,400 revolutions per minute and that many other motors can make only 2,600.

Answer.—The present tendency in automobile design is toward motors of very high speed in order to obtain as much power as possible from a given weight of engine, and also to give the car a more even motion. High speed motors have comparatively small, but perfectly balanced crankshafts, extremely light pistons and connecting rods and large valves.

Vulcanizers.

Is a steam vulcanizer better than one in which no steam is used? Is there any danger of the "Marvel" steam vulcanizer exploding? The water is sealed in it at the factory.

Answer.—The efficiency of a vulcanizer does not depend upon whether steam heat, gas or electric heat is used, but upon its ability to maintain an even heat at the required temperature. It is, as a rule, easier to regulate the heat with a steam vulcanizer, as there is a definite temperature for each steam gauge pressure. More depends upon the design of the vulcanizer than upon the method of heating. We are not familiar with the "Marvel."

Motor Horse Power.

In a former issue you state that to find the horse power of an automobile motor, multiply the square of the cylinder diameter by the number of cylinders and divide by two and one-half. It seems to me that the length of stroke and the speed of the motor has something to do with the horse power. Was something forgotten in the above rule?

Answer.—The above rule is known as the A. L. A. M. rule and is correct as stated above. The factor two and one-half takes care of the speed, length of stroke, mean effective pressure and also one factor used in finding the area. At the time this rule was made it was considered that the longer the stroke the slower the motor would run; that what extra power a motor gained by a longer stroke would be lost by a decreased number of revolutions. This is no longer strictly true, due to the lightening of the moving parts of the motor by use of very high-grade materials. However, as all gas engine rating is nominal, excepting actual brake test, the above rule is still in general use for auto motors. The rule does not apply to stationary gas engines.

Save Hard Work —Get Better Looking Fence

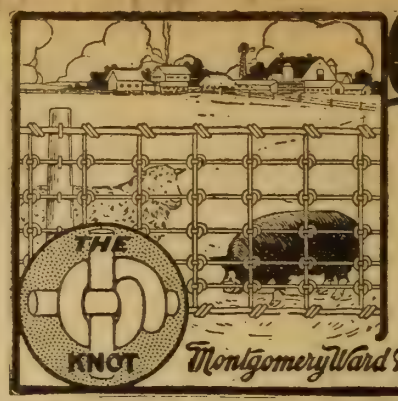
THE swinging joint makes Apex Fence flexible—self-adjusting to hills and hollows. Easy to set up. No bagging or sagging — doubly strong at every joint — strains and shocks evenly distributed — rigid, reinforced construction keeps the fence in shape. Made of open hearth steel wire — heavily galvanized. Write for booklet.

No Holes to Dig
When You Use
Apex Steel Drive Posts

Just think what this saves you! Drive the posts without leaving your wagon. Save on hauling and handling — save 8 to 10 cents a post in setting. Drive Apex Posts in any soil, gravel or soft shale. Made of elastic carbon angle steel—tough and strong—can't be injured. Last for generations—do not bend, break, rot or burn.

Write for the "Apex Way" booklet and see how you can save a lot of work, time and money and have better fencing on your farm.

Janesville Barb Wire Co.
733 S. Franklin Street, Janesville, Wis.



ONLY 23½¢ PER ROD

THIS hard, tough, springy sheep and hog fence—26 in. high—only 23½c per rod. Stock fence—42 in. high—only 24½c per rod. Wires are of basic open hearth steel. Heavily galvanized. A real stiff, stay fence. Does not rust nor get out of shape. Hogs can't root through, nor cattle trample it down.

EGGS FOR HATCHING. Pure R. C. Rhode Island Reds, $1.25 per 15, $5.00 per 100. Address Fred M. Smith, Route 7, Elkhorn, Wis.

SINGLE Comb Buff Leghorn eggs from high-class stock at $1 per 15, 100, $4.50. Chas. Schmit, R. 22, Hortonville, Wisconsin.

MY R. C. REDS ARE MONEY MAKERS. Eggs postpaid, prices right, circular free. Mrs. G. Ellis, West Salem Wisconsin.

MY S. C. REDS won highest state honors. Rose and single comb; eggs $2.00; cockerels $3.00. Wm. Wichern, Baraboo, Wis.

POULTRY DEPARTMENT

THIS department is edited by a competent poultryman, who will be pleased to answer questions concerning disease, poultry management, etc., when they can be answered through the department. Questions will not, however, as a rule, be answered by mail, and stamps need not, therefore, be inclosed with inquiries. Address all letters relating to poultry topics to this office.

Preserving Eggs.

Now is the time to preserve eggs. The waterglass method worked out by Prof. E. F. Ladd, of the North Dakota Agricultural College, is very simple. Eggs put up according to it will retain their original flavor.

Directions: The eggs must be fresh and clean. Washing an egg spoils its keeping qualities. Galvanized iron vessels, crocks, jars or wooden kegs may be used. The vessel must be clean. If of wood it must be thoroughly scalded. Use a good grade of waterglass. One like a heavy white jelly that flows like cold molasses. Use one quart of the waterglass to ten quarts of pure water that has been boiled. Pour into the vessel when cool. Fresh eggs can be put into it from time to time until the jar is filled. There should be two inches of the solution above the eggs.

Second-prize Buff Plymouth Rock cockerel. This bird was shown at the Greater Chicago Poultry Show in January, 1916. It was bred and is owned by Milan C. Astle, Momence, Ill.

Keep the preserved eggs in a cool place, as in a cellar. The eggs will contain some gas and so crack when boiled. This can be prevented by making a pin hole in the blunt end of egg before boiling them.

Prize pullet at Chicago. This bird was first pullet, Buff Plymouth Rock, at the Chicago show in January, 1916. It was bred and is owned by Milan C. Astle, Momence, Ill.

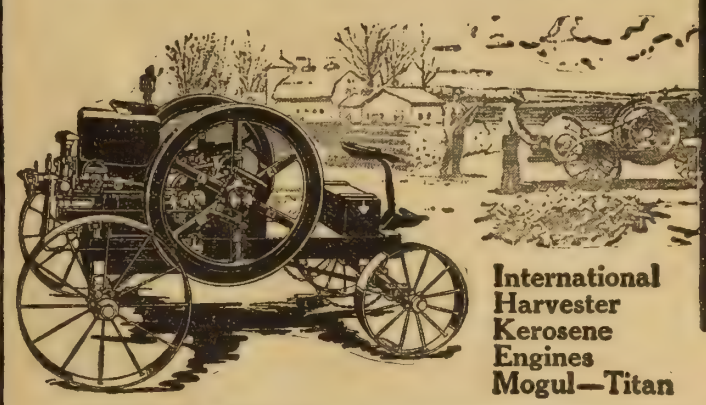
Spoiling the Hatch.

To the Editor:—I wish some of your readers would describe in these columns a method of treating eggs so that they will not hatch and at the same time producing no injury to them for market purposes. I have a fine flock of pure-bred White Wyandottes and it frequently happens that I have more eggs than I can dispose of to my customers and these all pure breds it follows that the eggs from my flock would be excellent for hatching purposes. I find it quite a common practice for the storekeeper to set aside these eggs for certain of his customers, trading them without boot on either side for the eggs that the customers bring to his store. I claim this is not fair. I pay from $3 to $5 each for my cockerels and have gone to considerable expense in building up my flock and yet others can use eggs from my flock and they will very soon be competitors of mine and yet I get no benefit from their trade.

I would like to know what your readers think of adopting some plan by which eggs might be ruined for hatching and yet not injured for market. I have heard that if you just dip them in hot water this will do it, but I have never tried it. I have also heard that if you stick a pin into the shell of an egg the germ will die and never hatch. It seems to me that this would let air in and that the egg would spoil. I will wait anxiously to see if some of your subscribers have any advice to give on this matter. It may seem unethical, to be sure, but I claim that it is unethical to ask your storekeeper to become a party to any such dishonest transaction.

Subscriber.

Welcome News on Engines



International Harvester Kerosene Engines Mogul—Titan

HIGHEST AWARD PANAMA-PACIFIC INTERNATIONAL EXPOSITION

INTERNATIONAL Harvester Mogul and Titan engines work successfully on kerosene, running on light or full loads. They use the least expensive of oil fuels. You are not limited to one kind of fuel, as with a gasoline engine, but can use any kind that is most convenient or least expensive. That is a very real advantage.

You know something about I H C engines. You have heard of their thorough reliability, the good material and workmanship that goes into them, the ease with which owners get repairs and service when needed, the years they last—and the other points that have sold a quarter million I H C engines.

But do you appreciate what real kerosene-burning means—what it saves you in money—how it assures you an unlimited supply of cheap fuel? You need Mogul or Titan kerosene-burning engine power to be sure of always having power at a price you can afford.

Ask the I H C dealer to show you a Mogul or Titan engine—sizes from 1 to 50-H. P. If you prefer to write us, we will tell you where you can see our engines and send you catalogues at the same time. Drop a card to the address below.

Grade Flock Makes a Good Record.

To the Editor:—I have a mixed flock of seventy hens (many of them being late pullets) and started keeping a record of the number of eggs laid each day the first of February. I got 1,027 eggs during the twenty-nine days of February, making an average of thirty-five eggs per day. So far this month they have averaged forty-two eggs per day.

I have not a very suitable henhouse, that is, as to light, having only two small windows, one in each end, but plan to improve it this coming summer. The building is only 14x16 feet, no doubt small for so many hens, but I thought they did well under such circumstances.

As to feeding, in the morning I feed about five quarts of oats and a pail of corn on the cob, the morning feed being taken into the house the night before so as not to be fed cold. In the evening I feed warm bran mash and oats with a few additional boiled potatoes and scraps from the table. I keep them well supplied with oyster shells, gravel, ashes and plenty of clean, fresh water.

I have also found that one of the most important things is to keep the coop dry and this can be done by keeping plenty of clean straw on the floor. I also scatter the dry feed in the straw, thus making the hens work for their feed. Occasionally they have been given meat scraps and thick sour milk.

Now this is not to be considered as boasting, but merely to show what can be done with common stock (some call it scrub stock) if given proper care, for everyone knows than anything, to do its best, must be given proper care.

Would like to hear through your paper from others as to their experience with chickens. A. H. Dahl.

FREE ILLUSTRATED Catalog. Big bargains on account of room. Leading breeds, blooded poultry, pigs, sheep, all breeds calves. 30 blooded Barred Plymouth Rock eggs, $1.00; 100 eggs $3.50. S. C. Letters intended for publication should be accompanied by the name and address of the writer, not necessarily for publication, but as a matter of good faith. All communications intended for this department should be addressed to Editor Home Dept., Wisconsin Farmer, Madison, Wis.

Attention to Teeth Important.

According to Dr. C. N. Johnson, of Chicago, proper care of children's teeth will eliminate epidemics of diphtheria, measles and scarlet fever. Dr. Johnson was chairman of the public service commission of the Chicago Dental Society, which established dental clinics in the public schools of that city. These clinics were taken over by the city two years ago and have since been maintained by it.

Ample opportunity was afforded by means of these clinics for the study of the above-named contagious diseases, and it was estimated that in 1915 the actual cost to the citizens of the city of Chicago of diphtheria, measles and scarlet fever among children was more than $6,500,000.

Nor does that take into consideration the number of deaths. All of these diseases are preventable. The germs were communicated simply by bad teeth.

This was demonstrated by a circumstance in one of the schools while the commission, with Dr. Johnson at its head, was studying the problem. There had been an epidemic of scarlet fever and it seemed impossible to stamp it out effectually. It was then decided to allow no children who had scarlet fever to return to school until their teeth had been examined and treated. This measure stopped the sporadic epidemics in that school.

Of the 80,000 school children examined by the dentists' commission, 80 to 97 per cent had defective teeth.

These are startling figures and when we consider the influence of bad teeth over the health of the children we realize the importance of constant attention to the matter of keeping them clean and in perfect condition.

Noon Meal With Reference to Children.

There is no reason why the ordinary family dinner should not be suitable for school children or served in a way that adapts it to their needs. The usual first course of meat and vegetables contains nothing, except the meat, which cannot be given to the youngest children. The vegetables, providing they are carefully prepared by simple methods, are especially needed and can often be made attractive to children by being served with a little meat gravy. As a substitute for the meat itself, milk can

THREE LITTLE FARMER FOLKS.
Hazel, Elda and Edwin, children of Mr. and Mrs. Henry Camp.

be provided in the case of the younger children. These articles, with the bread and butter, provide most of the food needed.

The dessert course is suitable for children as well as for grown people, unless it consists of rich pastries or puddings. The latter are not considered wholesome for children, if for no other reason than that they are likely to lead to overeating. Such desserts as fruit, fresh or cooked, with cake; cereals with milk or cream and sugar; custards and custard puddings; gelatin dishes; simple ice cream; water ices; and other simple desserts may be given.

Whether or not the family meal is healthful for children depends not only on the food materials selected, but also on the way in which they are cooked. Simple methods are to be preferred from the standpoint of health as well as from that of the housekeeper's time. All dishes that

CARL AND CLIFFORD SPINDEN.

are likely to contain overheated and scorched fats, such as foods carelessly fried in a pan in a small amount of fat, should be avoided. Deep-fat frying is open to fewer objections, since, if properly done, foods will absorb little fat and the fat will not scorch. Vegetables cooked in water or in their own juices and seasoned with salt and a little butter or cream are easier to prepare than those that are served with white sauce, scalloped, or cooked in other elaborate ways.

What is said above applies equally to all meals. There is, however, one special precaution that applies to the noon meal when it is hurried. This refers to tough, hard foods that are likely to escape proper mastication. It is a mistake to think that the foods given to children must always be soft or finely divided, for children's teeth need exercise quite as much as their muscles do. When time for eating is limited, however, it is well to omit foods that are difficult to chew, and in extreme cases it may be necessary to serve only soft or finely divided foods—sandwiches made from crustless bread with finely chopped fillings, for example. Before resorting to this, however, it is well to make sure that the time for eating and for insistence of good table manners is not unnecessarily cut short. The advantage of putting the meal on the table promptly and of having foods served in individual portions, or at least ready to eat when they are brought to the table, should be kept in mind. To have the meat already sliced and the dessert in cups instead of in one large dish from which individual portions must be served, and to follow the same general plan with other foods, may change a hurried meal into one at which there is plenty of time for attention to details essential to health and good manners.

The United States Department of Agriculture has just issued a bulletin containing some valuable information on the subject of lunches for school children. This bulletin may be had by writing to the Department of Agriculture, Washington, D. C., and asking for Farmers' Bulletin 712.

No Idle Moments For Her.

To the Editor:—I think the Home Department is just fine, we can learn so many different ways of doing things. I like to read the story too and the babies are so nice. My own babies are all grown up and all married but one. They have babies of their own and I have nine nice little grandchildren.

As I have no babies to take care of I have a good deal of spare time in winter. I do not get out much but I am a lover of flowers and fancy work, and I will tell you how I have spent my spare time this winter. I hope you won't think I just want to brag about myself, for I just love to read what others are doing.

I have all my scraps and rags made up in useful things and there is nothing to lie around at housecleaning time. I braided two nice rag rugs, one blue and white with a touch of pink for my blue bedroom; made two sofa pillows, one of silk pieces and one of velvet (not the common crazy patch, but very pretty), three porch pillows of nice gunny sacks, and two large centerpieces with crocheted lace on them. I also cut out all my worsted scraps for a comfort top.

This is my first visit to the Home Department as a letter writer, but I do enjoy reading the letters from others. Mrs. F. E. T.

Three Cheers For the Babies.

To the Editor:—We enjoy seeing the pictures of the dear babies and decided to send the picture of our twin boys, Carl and Clifford, born September 25, 1914. They were fifteen months old when this picture was taken and weighed twenty-seven and twenty-eight pounds. They are bottle babies. They are bright, active youngsters. Three cheers for the babies who will in a few short years be the men and women of our country.

Mrs. C. F. Spinden.

Saves the Baby Pictures.

To the Editor:—I have been so interested in the mothers' letters and the baby pictures, all of which I am saving, that I thought I would do my part toward the department and send a picture of my little girl. She will soon be four years old and has always been well and strong. We have one other child besides, a baby boy nearly ten months old.

We live on my father's farm of 147 acres, which we run in partnership with my youngest brother. Both my husband and my oldest brother are graduates of the state agricultural college, while my youngest brother is now taking the short course, so you see the men folks at least like the farm. We are all interested in it and most particularly in the farmer babies.

Mrs. G. H. Beach.

How to Treat Wall Paper Before Papering.

To the Editor:—I noticed M. A. G.'s letter in regard to papering over whitewash. To make the paper stick take a half pound of glue and one cake of silk soap (cut fine), put in a vessel with one quart of hot water. Let stand overnight. It will be thick jelly in the morning. Thin with water and apply to wall with a brush. Let dry before papering. Sweep the wall before applying the glue. L. R. W.

Lily Blooms Every Month.

To the Editor:—I noticed in one of the papers a reader's request for information as to the care of a calla lily. I have a two-year-old plant which has had a blossom on it every month for more than a year. I have always kept it in the house even during summer. It is planted in a gallon sirup pail and that placed in a jardiniere so that it can be watered from below. I always use hot water, which, of course, is impossible if not put into some other jar. I also give it a few drops of ammonia in the water every week.

At present my lily has a large blossom and also a bud and six large leaves. I took a little one from beside it last spring and that has had a flower, too. Be sure to give the lily all the sunshine possible.

A Reader.

More About That Lily.

To the Editor:—One of your readers asks how to make calla lilies and geraniums bloom. Would like to give my experience.

Calla lilies are mostly through blooming in May, when they are given a rest by letting them stand dry in a cellar for about two months. In July take the bulbs out of pots, take off all dry leaves and roots and repot in a rich soil, covering bulbs with soil just

ALMA AND RACHEL GENTNER.
Five and three-year-old daughters of Mr. and Mrs. A. B. Gentner.

enough to let crown appear. Calla lilies are heavy feeders. After pot gets filled with roots a watering of liquid manure will benefit, or a little bone meal scattered on top of the soil will answer the purpose.

Geraniums are often potted in too

rich a soil, especially manure mixtures, which gives them a rank, soft growth and causes them to bloom sparingly. A good compost is any good soil with a little bone meal added. Care must be taken not to use too much bone meal because it is a strong fertilizer. Planting in too large a pot is also a practice some people have, the soil turning sour before the roots are able to fill the pot. Most pot plants like to be root-bound before they bloom. J. H.

How to Clean Irons.

To the Editor:—I want to tell the lady who has trouble with her irons turning the clothes yellow how to take care of them. Wash them in good soapsuds and scour them with any

LITTLE MISS BEACH.

good scouring powder. Then wash them again with good soapy water and dry them with a clean, dry cloth and the irons will be as good and clean as new and will not rub off. Another good way is to have a newspaper with a little kerosene on it. Rub the iron on this and then on a clean paper. You will have good results from this. A Subscriber.

Grease the Bread.

To the Editor:—I noticed in one of the late papers that someone wanted

A BEAUTIFUL PAIR OF TWINS.
Alberta and Adalberta Logan, eight months old, are the daughters of Mr. and Mrs D. R. Logan.

to know of something to keep bread from drying out. If she will grease the bread on top before it is baked and again when she takes it from the oven I think she will find that it will not dry out so fast. Mrs. E. T.

Slips Geraniums in July.

To the Editor:—I enjoy reading your paper very much and note in a late issue a request for care of flowers in winter. I take a small slip from a blooming geranium in July and give it plenty of water and sunshine. It never fails to bloom in the winter.

My calla lily I take out of doors in the open to rest the first of August. The first of September I bring it in the house, give it new sandy loam and plenty of lukewarm water and sunshine and it blooms every spring. A Reader.

Sun Preserves.

To the Editor:—To make sun preserves strawberries use one cup of sugar to one cup of berries. Turn together and boil for five minutes. You can have three or four small basins on the stove at once. When cooked, place on platter and cover with glass in the sun. As the moisture forms on the glass turn it over. I use a window glass. Have a glass large enough to cover dish up tightly. When moisture ceases to form the berries can be stored away the same as other preserves in a dark place. Illinois.

A Few Pointers.

If you want to iron an article immediately after sprinkling it try dampening it with boiling hot water. Roll it tightly for a moment or two, shake it out and iron with a hot iron.

Embroidery flounces on petticoats will wear much longer if a narrow lace edging is stitched underneath the flounce. This protects the points of the embroidery and gives a pretty finish, too.

When cleaning brass fenders or andirons mix a little powdered alum with the polish if you want a brilliant polish with about half the work of rubbing that is necessary with ordinary cleaning.

A bit of cloth or chamois should be kept in the sewing machine drawer to wipe off the machine before beginning to stitch.

Never fold an umbrella when it is wet, but keep it folded when it is dry.

The hands should be dipped in cold water before making pastry.

Rice pudding sweetened with brown sugar will have a much richer flavor.

Recipes.

Fruit Cake.—Four eggs, one cup sugar, two cups molasses, one and one-half cups butter, one-half cup milk, one teaspoonful soda, one pound raisins, one-half pound currants, one-half pound citron sliced fine, one heaping teaspoonful each cinnamon, cloves, nutmeg, five cups flour. Bake two and one-half hours in a slow oven.—Mrs. C. H. G.

Drop Cookies.—Cream together one cup of butter and one and three-fourths cups of sugar. Add four well-beaten eggs, one teaspoonful of soda dissolved in one-half cup of sweet milk, four cups of flour sifted with two teaspoonfuls of baking powder, one teaspoonful of vanilla. Drop from a spoon on a buttered pan. Raisins can be added if liked.—Mrs. A. C. C.

Cocoanut Bars.—One-half cup of rich milk, one and one-half cups of sugar, one tablespoonful of butter, boil just twelve minutes, add one-half teaspoonful of vanilla and one cup of cocoanut. Beat till creamy. Pour on buttered pan and when nearly cold cut in squares. Nut meats may be added in place of cocoanut if liked.—Mrs. A. C. C.

Souffle of Cold Meat.—Four tablespoonfuls butter, four tablespoonfuls flour, two cups milk, one-half teaspoonful salt, one-eighth teaspoonful pepper, one-fourth teaspoonful paprika, slight grating of nutmeg, two cups chopped ham, three eggs. Melt butter in saucepan, add flour, stir until blended, add gradually, while stirring constantly, scalded milk and cook until thick. Season with salt, pepper, paprika and nutmeg. Add ham, then egg yolks beaten until thick, and last the whites also stiffly beaten. Cook over boiling water fifty minutes. Serve with green pepper sauce.

Green Pepper Sauce.—Two cups stock, four tablespoonfuls each pepper, fat and flour. To meat stock add finely cut pepper, simmer one-half hour and strain. Melt fat, skimmed from stock, add flour and let brown, then add stock slowly, stirring constantly. Boil two minutes and season.

HERE'S a work shoe that gives lasting wear under the severest conditions. Uppers are of Resisto Veal, the special leather that resists the alkali of the soil and ammonia of the barn yard.

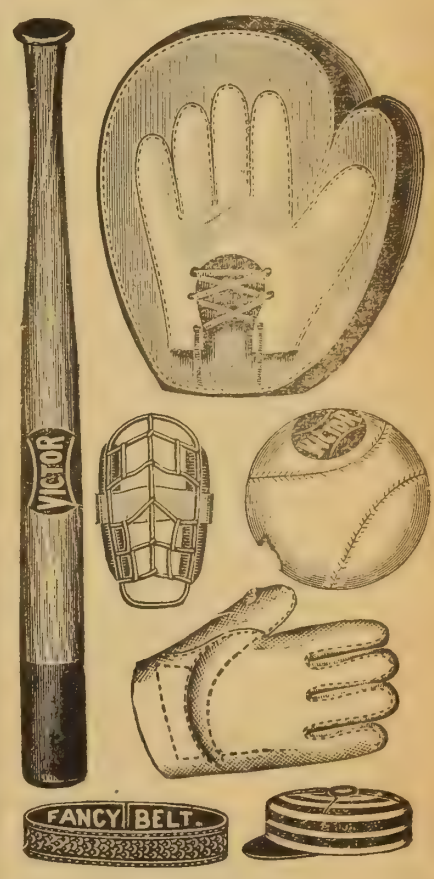
Baseball Outfit for You



There are seven splendid pieces in this great outfit. The ash bat is a good one. The mask is made of heavy wire, full size. The catcher's mitt is thickly padded, very heavy and has patented fastener. The glove is of tanned leather and has patent clasp. The ball is strongly stitched and will last. A neat, adjustable belt and a dandy cap complete this great outfit. Remember you get the whole outfit of seven pieces for a little easy work. Write me to-day and I will tell you just how to get it.

Be Kind to Animals.

Dear Young Folks:—I have been reading the Young Folks' stories for a long time and think they are very interesting. I am going to write about kindness to dumb animals.

I think that we should always be kind to dumb animals. I have seen them treated very cruelly and it always makes me feel badly. Some of them, such as horses and cattle, we could hardly do without.

An animal that is treated cruelly by its master will always be expecting some cruel act whenever its master comes near. They are harder to control, too, when they are not treated kindly. I think people who can stand to treat animals that way must have very hard hearts.

I help take care of several animals and I never intend to be cruel to them.

—Eunice Marie.

Takes Prize in Spelling.

Dear Young Folks:—I am reading your letters and take great interest in them. I can hardly wait until the mail carrier goes by.

We live on an eighty-acre farm and have about a quarter of a mile to go to school. I like to go to school very much. Our school was out the 3d of March. We did not have a regular program, but we invited our parents to school and had a few studies. We also spelled down and I won. We girls served a lunch consisting of potato salad, cocoa and cake for our domestic science lesson.

Our teacher gives us prizes for the most head marks in spelling. I got the most in our class. I most always get the most. Last year we had a township spelling contest. Seven schools were represented. I won that time, too. We are going to have an oyster supper for the prize this time. I am eleven years old and in the seventh grade.

I have a horse named Lady that I drive to town to take my music lesson. I love music and take lessons on the piano.

My father raises Chester White swine and Holstein cattle and takes pigs to the state fair. I want to go with him this year. —Juanita.

Makes Cookies All Alone.

Dear Young Folks:—I am a little girl nine years old and I have always lived in the city until a year ago. Then my mamma died and I came out in the country to live with my uncle and aunt. I like the country very well and think it is a very good place for girls and boys. I have gained twelve pounds since I came here. The folks I live with are very good to me.

I am in the fourth grade at school and I haven't missed a day. Every Saturday I take my music lesson. I took music lessons in the city, too.

I have two pet chickens, a little rooster and a hen. They are very cute and every time I go to the chicken house with some feed for them they fly up on my arm and start eating out of my hand or the basin. I like to call the cattle into the barn at night.

I am having vacation now and Saturday I am going to take my music lesson and after that I am going back to the city to visit. I had a birthday the other day and had a cake with nine candles on it. A week ago I made my first cookies all alone. I am going to learn to be a good housekeeper. —Iris.

Always Tell the Truth.

Dear Young Folks:—One day as I was dusting in the parlor the globe to our lamp was standing on the bookcase. When I walked past it I came against it some way and it fell to the floor and broke in several pieces. It was mamma's and papa's wedding present and I knew they wouldn't lose it for anything and I was afraid I would get a scolding. So I ran upstairs and began to cry. In a few minutes mamma came upstairs. She asked me what I was crying for and I told her I had broken the globe to the lamp. Then she said, "Don't cry, I would rather lose everything I have than have you tell a lie."

—Golden Hair.

Takes Trip to Montana.

Dear Young Folks:—I live on a 320-acre farm two miles from town. I live with my grandparents and uncle and aunt. I am twelve years old and am in the seventh grade.

I have a married sister and a brother who live with my father in Montana and a sister eleven months older than I who lives with my other grandparents in town.

I went to Montana with my grandfather and aunt when I was about four years old and then I went again when I was ten years old. We went to the town of Intake and there we saw the headgates where they irrigate the land. On the way back from Intake I rode my brother's Indian pony about seven miles of the way. It was thirty-five miles from uncle's to Intake. The pony's name was Buck. I rode him several times after that.

There are a lot of rattlesnakes in Montana and once when my little cousin saw a snake he said that it just rattled its tail at him and ran in a hole. —Alma.

POTATOES AND SEEDS ALMOST GIVEN AWAY.

TO INTRODUCE—I offer 20 Big Hills of genuine Early Six Weeks' Potatoes—best quality and earliest in the wide world—also $1.00 worth the finest Vegetable and Flower Seeds—all mailed for 30 cents. COOK, Seedsman, Hyde Park, N. Y.—Adv.

WITH OUR ADVERTISERS.

A Solution of the Light Tractor Problem.

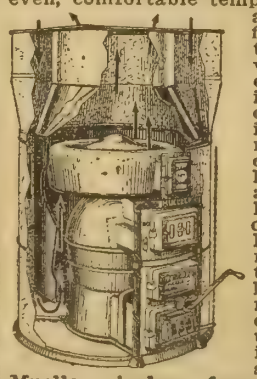
WE have a solution of the light farm tractor problem in the Denning Model E light farm tractor. This engine weighs but 3,600 pounds, will develop ten horse power at the draw bar at any speed and will pull two plows in any soil fit to cultivate. All gears run in oil in dust-tight casings, which provides for the durability of these parts. The equipment includes a Waukesha motor, Perfex radiator, Bennett carburetor, Dixie magneto and New Departure ball bearings. Kerosene is used for fuel. Write for a complete description of this modern light farm tractor. Address the Denning Tractor Company, Cedar Rapids, Iowa, and kindly mention this paper. See advertisement on page 11.—Adv.

The Opportunity State.

MONTANA is a land of opportunity. In the past six years 29,000,000 acres of government and Indian lands were disposed of to settlers. In the past year 23,000 original and final homestead filings have been made in that part of Montana reached by the Great Northern railway—this record is unequaled by any state, in the operations of the general land office. The homestead lands of agricultural value are going fast, but deeded land may be purchased at very low prices at present. This is an opportunity for you; cut out the coupon from the advertisement on page 13 and send today for the free Montana bulletin illustrated and fully descriptive of this remarkable country. Write to the address given in the advertisement.—Adv.

Thousands of Users Endorse Pipeless Heating.

A MUELLER pipeless furnace is one of the best protections against colds, catarrh, headaches and other ills. It provides the whole house with an even, comfortable temperature without any pipes or flues running through the walls. It is very easy to install in either large or small homes; if the house has no cellar a pit dug beneath the house will serve admirably. One large register connected directly with the furnace furnishes the heat—no heat is lost lost, no fuel is wasted, and no produce in the cellar is in danger of spoiling. The Mueller pipeless furnace burns hard or soft coal, coke or wood efficiently. Thousands of users endorse this furnace heartily. Right now is the best time to find out about this most convenient heating system. Write today for the free illustrated booklet which gives complete information. Address L. J. Mueller Furnace Co., 204 Reed St., Milwaukee, Wis., and kindly mention this paper. See page 17.—Adv.

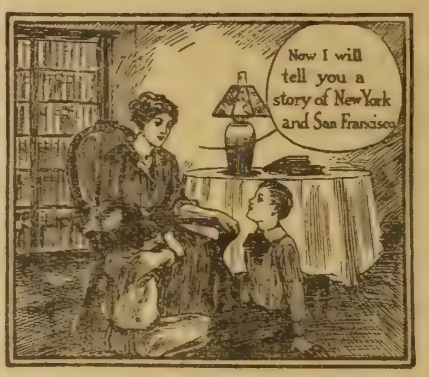


A $3,500.00 Home Game

419 Cash Prizes for

GIVING NAMES TO PICTURES

Idle Hour Entertainment---No Expense Required



$3,500.00 CASH

419 PRIZES

First prize	$1,250.00 cash
Second prize	625.00 cash
Third prize	350.00 cash
Fourth prize	250.00 cash
Fifth prize	150.00 cash
Sixth prize	100.00 cash
7th, $75.00; 8th, $50.00; 9th, $20.00.	
10th to 24th, each $2.50	$ 37.50
25th to 419th, each $1.50	$592.50

Should there be a tie for any prize, the full prize tied for will be paid each tying contestant.

There is no work connected with the Picturegame in any way. It is what we say it is—a picture-naming entertainment for all the family to play during their idle moments; and we will give the great cash prizes to those who use their common sense best. All contestants will be assured of equal treatment, and splendid fun. Send in at once and learn all about this unique opportunity game. **Do that at once, and have it over with!**

Today's Magazine offers every person the opportunity of competing in a great cash pastime, something with which to fill spare moments at home with money interest. **You** may win a great cash sum playing! See the picture to the left? It's an example, to show you how the $3,500 Book Title Picturegame is played. It shows a Woman saying to two children, "Now I will tell you a story of New York and San Francisco". What book title would make a good name for that picture? Why, the title, "A Tale of Two Cities". That's plain, isn't it?

You will be offered a list of book titles, arranged in alphabetical order, from which all titles for the pictures must be chosen. All contestants will glance over the titles, and submit those they think best fit for the pictures. The prizes will be given for the 419 best sets of answers. No book knowledge at all is used none is needed in the picturegame at all.

We have provided a way by which all may compete free of charge without one cent of expense. Send in the coupon **right now** and learn all about this home game. At least know what it is—it may prove to be a gold mine for you.

Photos of 6 Baseball Stars FREE

NAPOLEON LAJOIE

Send No Money these six fine photos are absolutely free to boys and young men who are interested in baseball. Here are the names of the world famous stars whose photos I'll send you free:

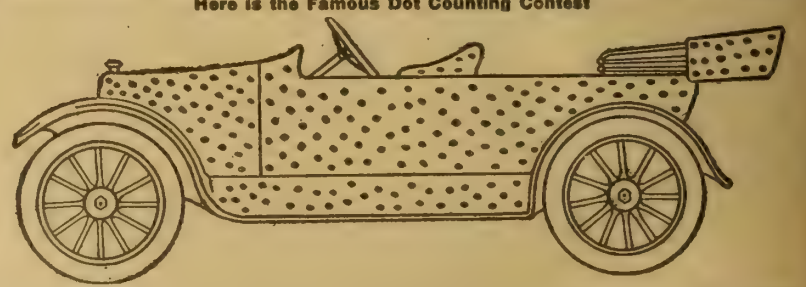
Grover Alexander, *pitcher* for Philadelphia Nationals.
J. Franklin Baker, *third baseman* for N.Y. Americans.
Joe Jackson, *left fielder* for Chicago Americans.
Napoleon Lajoie, *second baseman* for Phila. Athletics.
"Heinie" Zimmerman, *3d baseman* for Chicago Cubs.
John J. Evers, *second baseman* for Boston Nationals.

These life-like action pictures are not the ordinary kind. The photos are so good that they show the features of the players almost as plainly as they would be shown in photos costing $5 a dozen. After you've seen these photos you'd recognize the players if you passed them on the road. You probably know the history of each of these great players. Your friends will be greatly interested in the photos. We're offering these photos absolutely free and postpaid because we want your name if you're in any way interested in baseball. We have photos of 194 other great baseball players we'd like to send you, making a complete set of 200. Baseball fans go wild over this splendid collection of life-like photos of world famous baseball players. We also have a large line of baseball gloves, mitts, balls, etc., that we know will interest you. Our baseball goods are given as rewards to our friends who will do a little friendly boosting for Successful Farming and take a few subscriptions for us. I'll gladly tell you all about my dandy new plan for helping you get 194 additional photos and all the baseball supplies you want, without paying out any of your own money. Send your name and address today for the six free pictures—a post card will do.

E. T. MEREDITH, Publisher,
Successful Farming, 60 Success Bldg., Des Moines, Ia.

Count the Dots and Win a Prize

Here is the Famous Dot Counting Contest



You see in the picture, an Automobile covered with dots. By being careful and thinking you can count the number of dots on this Auto. If you can do this, we will send you as a prize, *a surprize package of beautiful season and greeting post cards,* lithographed in rich colors and also a certificate of entry in our grand contest for an Overland Automobile. All you have to do is to enclose a two cent stamp in your letter to pay postage and cost of mailing.

OVERLAND AUTO GIVEN AWAY

Remember the Overland will absolutely be given away at the close of the grand contest. In case of a tie an Overland will be given to each person so tied. Send at once so you can be entered in this great contest. Full particulars by return mail.

THE AUTO MAN, Dept. 300 Des Moines, Iowa

International Sunday School Lesson.

Lesson for April 16, 1916.
(By E. O. SELLERS, Acting Director of Sunday School Course.)

Peter and Cornelius.

LESSON TEXT—Acts 10:1-23.

GOLDEN TEXT—There is no distinction between Jew and Greek; for the same Lord is Lord of all, and is rich unto all that call upon him.—Rom. 10:12.

Thus far Christianity had to do with Jews and Jewish proselytes only. Now its circle begins to widen so as to include the Gentiles. The central figure of this lesson, Cornelius, was a captain commanding one hundred men in the Roman army. The chasm between blacks and whites, which so widely existed in America, is nothing compared to that which divided the Jew and Gentile. We take the whole story of Cornelius in today's lesson and consider the Easter story next week.

1. A Prepared Convert (vs. 1-8). (1) His position. Caesarea was on the great sea and was the political capital of Judea. It was about seventy miles from Jerusalem and thirty from Joppa. Cornelius, who was captain of a band of men born in Italy, was a Roman citizen, and perhaps had been connected with the great Roman general Scipio. (2) His character. He was a man of promptness, appreciation and obedience, (v. 33). He was also a God-fearing man, whose piety included his whole household. He was a man of prayer and generosity (vs. 31, 32), for he gave "much alms" to both Jews and Gentiles. The result was that he was honored greatly by all, especially by the Jews. It does not seem that Cornelius was a proselyte to the Jewish faith (vs. 28-11:3), and he certainly was not as yet a saved man (11:13, 14). Cornelius was a man of a vision, not of dreams or of trances, for this vision came in the open daylight (v. 30), when an angel, looking like a man, appeared unto him. His fear was calmed and he was informed that his prayer, for he was a "seeker after God," had been heard. The "memorial" (v. 4) spoken of was that part of the meat offering which the priest burned upon the altar and which ascended unto the Lord as a sweet savor (see also Mal. 3:16). Cornelius is put to a strange test. He is to send for an unknown man to receive instruction. The angel was not to enlighten him, as it is man's province to witness for God. There is not a recorded Bible conversion without some human instrumentality. Cornelius, soldier that he was, at once obeyed instructions and sent out two devout retainers after Peter. Man alone could finish the work of the angels.

II. The Prepared Preacher (vs. 9-23). Tanning was considered an unclean occupation, but in Simon's house was the man God wanted to use on this occasion. No matter how poor a preacher, or unlikely the situation, if we obey God we can preach better than Gabriel. God laid, as it were, his right hand on Cornelius and his left upon Peter and drew them together. Again God uses a dream, linking the natural and the supernatural. A hungry man dreams of food, a very common occurrence, and God gave supernatural direction to a natural dream. God knows the right time to do the right thing. We do not need dreams for our guidance, as we have a full and sufficient revelation in the Word for our guidance.

III. The Prepared Ones Meet (vs. 23-33). Cornelius had his whole household ready when Peter arrived (v. 24), perhaps more people than on the day of the first great Pentecost. He said, "We are all here present in the sight of God to hear all the things that have been commanded thee of the Lord." This is a great statement if we consider its full content. Peter refused to accept worship, that alone belongs to Christ (v. 25) and he explained how God had thrust him outside of the circle of Jewish believers. He then rehearsed what God had done and asserted that "He is no respecter of persons," and that in response to those in every nation who work righteousness God had sent forth Jesus for the salvation of men, (1) That men might have peace through him (v. 36); (2) That he might be Lord over all; (3) That he had been anointed with the Holy Spirit and power; (4) That he had been crucified (1 Pet. 1; 18, 19; 2:24); (5) That God had raised him from the dead; (6) That he is to be the judge, and (7) That because of what he had done—"through the name of Jesus"—all that believe shall have "remission of sins." (This is a good sermon outline.) Following this wonderful sermon there occurred the Gentile Pentecost (vs. 44-46).

Practical. Cornelius had a lack, and he went to God to have it supplied (v. 4). Peter found his enlightenment in prayer.

God revealed his regard for all mankind and that Jesus Christ can and will save all who come to him by faith.

At Caesarea the infant church discovered that its field is the world and that the Pentecostal program was for all mankind.

This occasion taught Peter and the church that henceforth we are to regard all men as brothers and seek to win them for their Savior and ours.

OUR FASHION DEPARTMENT.

ALL PATTERNS, 10 Cents Each.

THIS department is prepared especially for The Wisconsin Farmer. We can supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10 cents each, postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering, all you have to do is to write your name and address plainly, tell us the correct number and size of each pattern you want and inclose 10 cents for each number. We agree to fill all orders promptly and guarantee safe delivery.

CATALOG OF SPRING AND SUMMER FASHIONS.

Send 10 cents in silver or stamps for our up-to-date 1916 large spring and summer catalog, containing over 400 designs of ladies', misses' and children's patterns, as well as the latest embroidery designs, also a concise and comprehensive article on dressmaking, giving valuable hints to the home dressmaker. Address all orders for patterns and catalogs to THE WISCONSIN FARMER, MADISON, WISCONSIN.

1604. Ladies' apron with or without belt. The pattern is cut in three sizes: Small, medium and large. It requires 4⅞ yards of 36-inch material for a medium size.

1614. Children's set, comprising a yoke dress with sleeve in wrist or elbow length, a slip and one-piece drawers. The pattern comprising all styles illustrated, is cut in four sizes: 1, 2, 4 and 5 years. The dress requires 2½ yards, the slip 2 yards and the drawers ¾ yard of 36-inch material, for a 2-year size.

1664. Ladies' empire night gown. The pattern is cut in three sizes: Small, medium and large. It requires 5½ yards of 36-inch material for a medium size.

1650. A pretty dress for the growing girl (with or without overblouse, and with two styles of sleeve). The pattern is cut in four sizes: 8, 10, 12 and 14 years. It requires 3⅝ yards of 44-inch material for a 10-year size for the dress, with 1½ yards for the overblouse.

1616. Costume for misses and small women. This desirable model has new and becoming style features. The pattern is cut in three sizes: 16, 18 and 20 years. It requires 5⅜ yards of 44-inch material for an 18-year size.

1364. A simple and becoming dress, suitable for house, porch or business wear, with sleeve in either of two lengths. The pattern is cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. It requires 7 yards of 36-inch material for a 36-inch size.

1592. A practical, comfortable dress or apron with bloomers for girls. The pattern comprises both and is cut in five sizes: 2, 4, 6, 8 and 10 years. It requires for a 6-year size 3¼ yards of 27-inch material, with 2¼ yards for the bloomers.

1593-1594. A smart costume for many occasions. Composed of ladies' waist pattern 1593 and ladies' skirt pattern 1594. This combination is especially nice for mature figures. The pattern for the waist is cut in six sizes: 36, 38, 40, 42, 44 and 46 inches bust measure. The skirt pattern in six sizes: 24, 26, 28, 30, 32 and 34 inches waist measure. It requires 3¼ yards of 36-inch material for the waist, and 4 yards of 44-inch material for the skirt for a medium size. To make the skirt and waist of one material will require 8 yards of 36-inch material. Two separate patterns 10 cents for each pattern.

1542. Boys' blouse with convertible collar and straight or French cuff. The pattern is cut in five sizes; 6, 8, 10, 12 and 14 years. It requires 2 yards of 36-inch material for a 10-year size.

1668. A very smart dress for mother's girl (with sleeve in either of two lengths). The pattern is cut in four sizes: 4, 6, 8 and 10 years. It requires 3⅛ yards of 44-inch material for an 8-year size.

1662. Ladies' waist, with drop shoulder and with sleeve in either of two lengths. The pattern is cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. It requires 3 yards of 36-inch material for a 36-inch size.

1658-1659. A charming gown. Composed of ladies' waist pattern 1658, and ladies' skirt pattern 1659. The waist pattern is cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. The skirt is cut in six sizes: 22, 24, 26, 28, 30 and 32 inches waist measure. It requires 7¾ yards of 44-inch material for the entire gown for a 36-inch size. Two separate patterns 10 cents for each pattern.

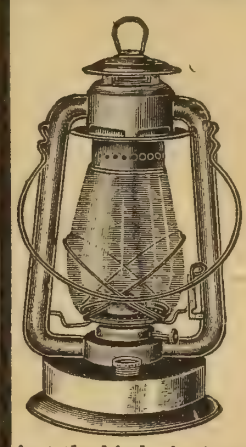
Cream Separator Manufacturing Specialists.

SAFETY
STORM BLAST
LANTERN FREE



This Safety Lantern cannot catch fire or explode. It is absolutely safe at all times and on all occasions. If you drop it in the hay loft, no oil can escape; if the cow kicks it over, it goes out at once.

It cannot blow out in a cyclone because of the storm blast feature. It is just the kind of a lantern every farmer needs about the house and barn.

Patent opening device raises and swings the globe free for lighting, filling and trimming. This lantern is fully guaranteed and is endorsed by the highest authorities on fire insurance, fire fighting and explosives. If dropped or turned over it immediately goes out. Oil cannot run. Impossible to catch fire. A lantern you will always feel safe with in the house or barn.

OUR OFFER

Send $2.00 for a three year new or renewal subscription to The Wisconsin Farmer and we will send you one of these Safety Storm Blast Lanterns as a premium free and postpaid.

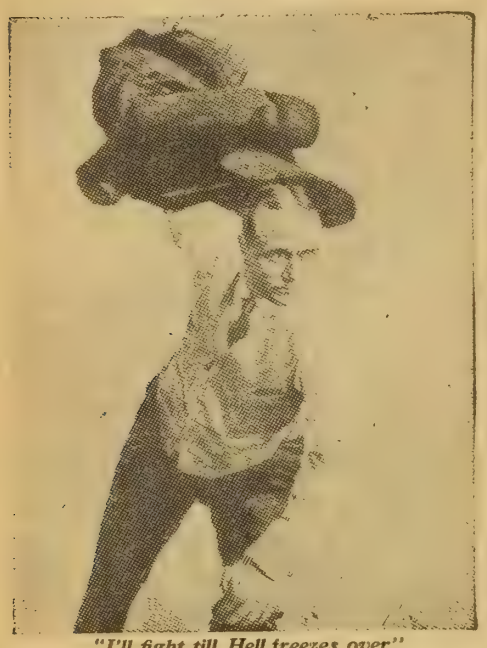
"Billy" Sunday—
The Man and His Message



"I'll fight till Hell freezes over"

A Great Book for Every Home

It carries the message that led over 200,000 to hit the Sawdust Trail

"Billy" Sunday has probably led more persons to make a public confession of discipleship to Jesus Christ than any other man who ever lived. Making Christians is from all angles the greatest work in the world. Therefore the world may well ask "What manner of man is this?" For over 200,000 men and women have taken Mr. Sunday's hand in token that henceforth their lives would belong to Christ. Over 2,000,000 persons have listened to Mr. Sunday's voice and still the work goes on. Tens of thousands of those men who have been converted under Mr. Sunday's influence were husbands—hundreds of whom had been separated from their wives and children by sin. Now in reunited homes, whole families bless the memory of the Man of God, who gave them back husbands and fathers.

Every conceivable type of humanity is included in the total of over 200,000 converts. The college professor, the prosperous business man, the eminent politician, the farmer, the editor, the doctor, the author, the athlete, the "man about town," the criminal, the drunkard, the society woman, the college student and the working man.

GOD'S MAN SENT IN GOD'S OWN TIME.

The greatest single personal force in the social and political as well as the religious life of America today is Rev. William Ashley Sunday.

The crowds follow him. Neither rain nor cold, not even a blizzard, can keep them away. Week after week vast throngs of people wend their way daily to hear a strong man preach a strong gospel which can meet the real need of every human heart. This man is doing what college professors, political demagogues, statesmen, lecturers, orators and the most eloquent preachers are unable to do. He compels men and women to hear him. He reaches their hearts.

"You old skeptic, we are counting time on you"

Let the Message of this Great Man Influence You, Your Dear Ones and Your Home

Authorized by Mr. Sunday

This work contains the heart of Mr. Sunday's gospel message arranged by subjects, and published by special agreement with him for the use of copyright material and photographs, which could be used only by permission.

Our Special Offer

By special arrangements with the publisher of this book we are permitted to use a limited number and **we will send this book** (500 pages and more than 50 illustrations) prepaid with

(Copyright 1915.)

CHAPTER XVI.

Practical Temperance Reform.

THE small town of Durford was not immune from the curse of drink. There was no doubt about that. Other reforms of viciousness there were in plenty, but the nine saloons did more harm than all the rest of the evil influences put together and Maxwell, though far from being a fanatic, was doing much in a quiet way to neutralize their bad influence. He turned the Sunday School room into a reading room during the week days, organized a gymnasium, kept watch of the younger men individually and offered as best he could some chance for the expression of the gregarious instinct which drew them together after the work of the day was over. In the face of his work in these directions, it happened that a venturesome and enterprising saloon-keeper bought a vacant property adjacent to the church and opened up an aggressive business—much to Maxwell's dismay.

Among the women of the parish there was a "Ladies' Temperance League," of which Mrs. Burke was president. They held quarterly meetings, and it was at one of these meetings held at Thunder Cliff, and at which Mrs. Burke presided, that she remarked severely:

"Mrs. Sapley, you're out of order. There's a motion before the house, and I've got something to say about it myself. Mrs. Perkins, as Mrs. Maxwell was unable to be present, will you kindly take the chair, or anything else you can lay your hands on, and I'll say what I've got to say."

Mrs. Perkins took Mrs. Burke's place as the president, while Mrs. Burke rubbed her glasses in an impatient way; and having adjusted them, began in a decided tone from which there was meant to be no appeal: "The fact is, ladies, we're not gettin' down to business as we ought to, if we are to accomplish anything. We've been singing hymns and recitin' lovely poems and listenin' to reports as to how money spent for liquor would pay off the national debt, and we've been sayin' prayers and pledgin' ourselves not to do things none of us ever was tempted to do, or thought of doin', and wearin' ribbons and attendin' conventions and talkin' about influencin' legislation at Washington, and eatin' sandwiches and drinkin' weak tea and doin' goodness knows what, but we've not done a blessed thing to stop men drinkin' right here in Durford and breakin' the town law; you know that well enough."

Mrs. Burke paused for breath after this astounding revolutionary statement and there was a murmur of scandalized dissent from the assembled ladies at this outspoken expression on the part of the honorable president of the Parish Guild.

"No," she continued emphatically, "don't you fool yourselves. If we can't help matters right here where we live then there's no use havin' imitation church sociables and goin' home thinkin' we've helped the temperance cause and callin' everybody else bad names who don't exactly agree with us."

"Men have got to go somewheres when their work is over and have a good time and I believe that we won't accomplish anything until we fix up a nice, attractive set of rooms with games and give 'em something to drink."

"I didn't say whiskey, did I? Anybody would think I'd offered to treat you the way you receive my remarks. Now we can't get the rooms right off, 'cause we can't yet afford to pay the rent of 'em. But there's one thing we can do. There's Silas Bingham—the new man. He's gone and opened up a saloon within about a hundred feet of the church, and he's sellin' liquor to children and runnin' a slot machine besides. It's all against the law, but if you think the village trustees are goin' to do anythin' to enforce the law you're just dead wrong, every one of you. The trustees are most of 'em in it for graft and they ain't goin' to close no saloon when it's comin' election day 'fore long, not if Bingham serves cocktails between the hymns in church. Maybe the trustees'd come to church better if he did. Maybe you think I'm usin' strong language, but it's true all the same, and you know it's true. Silas Bingham's move is a sassy challenge to us. Are we goin' to lie down under it?"

"I must say that I'm painfully surprised at you, Mrs. Burke," Mrs. Burns began. "You surely can't forget what wonderful things the League has accomplished in Virginia and——"

"Yes," Mrs. Burke interrupted, "but you see Durford ain't in Virginia so far as heard from, and it's our business to get up and hustle right here where we live. Did you think we were tryin' to reform Virginia or Alaska by absent treatment?"

Mrs. Sapley could not contain herself another moment; so, rising to her feet excitedly, she sputtered:

"I do not agree with you, Mrs. Burke; I do not agree with you at all. Our meetings have been very inspiring and helpful to us all, I am perfectly sure; very uplifting and encouraging; and I am astonished that you should speak as you do."

"I'm very glad you've found them so, Mrs. Sapley. I don't drink myself and I don't need no encouragin' and upliftin'. It's the weak man that drinks who needs encouragin' and upliftin'; and he wouldn't come near one of our meetin's any more than a bantam rooster would try to hatch turtles from moth balls. We've got to clear Silas Bingham from off the church steps."

"Well," Mrs. Burns inquired, "what do you propose to do about it, if I may be allowed to inquire?"

"Do?" The first thing I propose to do is to interview Silas Bingham myself privately and see what I can do with him. Perhaps I won't accomplish nothin'; but I'm goin' to try anyway, and make him get out of that location."

"You can, if anybody can," Mrs. Sapley remarked.

"Thank you for the compliment, Mrs. Sapley. Now Mrs. President, I move, sir—that is, madam—that the Parish League appoints me to interview Bingham."

The motion was duly seconded and passed, notwithstanding some mild protests from the opposition, and Mrs. Burke resumed her place as presiding officer of the meeting. Then she continued:

"Excuse me; I forgot the previous question which somebody moved. Shall we have lettuce or chicken sandwiches at our next meetin'? You have heard the question. Those in favor of chicken please say aye. Ah! The ayes have the chicken, and the chicken is unanimously carried. Any more business to come before the meetin'? If not, we'll proceed to carry out the lit'ary program arranged by Miss Perkins. Then we'll close this meetin' by singin' the 224th hymn. Don't forget the basket by the door."

Silas Bingham was an undersized, timid, pulpy soul, with a horizontal forehead, watery blue eyes and a receding chin. Out of "office hours" he looked like a meek solicitor for a Sunday School magazine. One bright morning just as he had finished sweeping out the saloon and was polishing the brass rod on the front of the bar, Mrs. Burke walked in and extended her hand to the astonished barkeeper, whose chin dropped from sheer amazement. She introduced herself in the most cordial and sympathetic of tones, saying:

"How do you do, Mr. Bingham? I haven't had the pleasure of meetin' you before, but I always make it a point to call on strangers when they come to town. It must be awful lonesome when you first arrive and don't know a livin' soul. I hope your wife is tolerable well."

Bingham gradually pulled himself together and turned very red, as he replied:

"Thanks! But my wife doesn't live here. It's awful kind of you, I'm sure, but you'll find my wife in the third house beyond the bakery, down two blocks—turn to the right. She'll be glad to see you."

"That's good," Hepsey responded,

"but you see I don't have much to do on Thursdays, and I'll just have a little visit with you, now I'm here. Fine day, isn't it?"

Mrs. Burke drew up a chair and sat down, adjusted her feet comfortably to the rung of another chair and pulled out her knitting from her work bag, much to the consternation of the proprietor of the place.

"How nice you've got things fixed up, Mr. Bingham," Hepsey remarked, gazing serenely at the seductive variety of bottles and glasses and the glare of the mirrors behind the bar. "Nothin' like havin' a fine lookin' place to draw trade. Is business prosperin' nowadays?"

Silas turned three shades redder and stammered badly as he replied:

"Yes, I'm doin' as well as I can expect—er—I suppose."

"Probably as well as your customers are doin', I should imagine? You don't need to get discouraged. It takes time to work up a trade like yours in a nice, decent neighborhood like this."

Silas stared hard at the unwelcome intruder, glancing apprehensively at the door from which several customers had already turned away when, through the glass, they had caught sight of Mrs. Burke. He was desperately ill at ease and far from responding cordially to Hepsey's friendly advances; and his nervousness increased as his patrons continually retreated, occasionally grinning derisively at him through the glass in the door.

"If you don't mind my sayin' it, Mrs. Burke, I think you'd be a lot more comfortable at my house than you are here."

"Oh, I'm perfectly comfortable, thanks; perfectly comfortable. Don't you worry a bit about me."

"But this is a saloon and it ain't just what you might call respectable for ladies to be sittin' in a saloon, now, is it?"

"Why not?"

The question was so sudden, sharp and unexpected that Silas jumped and almost knocked over a bottle of gin, and then stared in silent chagrin at his guest, his nervous lips moving without speech.

"I don't see," Hepsey continued, "just why the men should have all the fun, and then when a woman takes to enjoyin' herself say that it isn't respectable. What's the difference, I'd like to know? This is a right cheerful place and I feel just like stayin' as long as I want to. There's no law against a woman goin' to a saloon, is there? I saw Jane Dwire come out of here Saturday night. To be sure, Jane ain't just what you'd call a 'society' lady, as you might say; but as long as I behave myself I don't see why I should go."

"But, ma'am," Silas protested in wrathful desperation, "I must ask you to go. You'll hurt my trade if you stay here any longer."

"Hurt your trade! Nonsense! You aren't half as polite as I thought you were. I'm awful popular with the gentlemen. You ought to be payin' me a commission to sit here and entertain' your customers, instead of insinuatin' that I ain't welcome. Ah! Here comes Martin Crowfoot. Haven't seen Martin in the longest time."

Martin slouched in and reached the bar before he caught sight of Mrs. Burke. He was just raising the glass to his lips when Hepsey stepped up briskly, and extending her hand, exclaimed:

"How do you do, Martin? How are the folks at home? Awful glad to see you."

Martin stared vacantly at Mrs. Burke, dropped his glass, and muttered incoherently. Then he bolted hastily from the place without paying for his drink.

Bingham was now getting a bit hysterical over the situation and was about to make another vigorous protest, when Hiram Green entered and called for some beer. Again Hepsey extended her hand cordially, and Hiram jumped as if he had seen a ghost—for they had been friendly for years.

"Hepsey Burke, what in the name of all that's decent are you doin' in a place like this?" he demanded when he could get his breath. "Don't you know you'll ruin your reputation if you're seen sittin' in a saloon?"

"Oh, don't let that worry you, Hiram. My reputation 'd freeze a stroke of lightnin'. You don't seem to be worryin' much about your own reputation."

"Oh well, a man can do a lot of things a woman can't without losin' his reputation."

For an instant the color flamed into Mrs. Burke's face as she retorted hotly:

"Yes, there's the whole business. A man can drink and knock the seventh commandment into a cocked hat and then when he wants to settle down and get married he demands a wife as white as snow. If he gets drunk it's a lark. If she gets drunk it's a crime. But I didn't come here to preach or hold a revival, and as for my welfare and my reputation, Mr. Bingham and I was just havin' a pleasant afternoon together when you came in and interrupted us. He's awful nice when you get to know him real intimate. Now, Hiram, I hate to spoil your fun and you do look a bit thirsty. Suppose you have a lemonade on me, if you're sure it won't go to your head. It isn't often that we get out like this together. Lemonades for two, Mr. Bingham, and make Hiram's real sweet."

Mrs. Burke enjoyed hugely the disgust and the grimaces with which Green swallowed the sirupy mixture. He then beat a hasty retreat down the street. For two hours Hepsey received all who were courageous enough to venture in, with most engaging smiles and cordial handshakes, until Silas was bordering on madness. Finally he emerged from the bar and mustered up sufficient courage to threaten:

"Mrs. Burke, if you don't quit I'll send for the police," he blustered.

Hepsey gazed calmly at her victim and replied:

"I wouldn't if I were in your place."

"Well then, I give you fair warning I'll put you out myself if you don't go peaceable in five minutes."

"No, Silas; you're wrong as usual. You can't put me out of here until I'm ready to go. I could wring you out like a mop and drop you down a knot hole and nobody 'd be the wiser."

The door now opened slowly and a small girl, miserably clad, entered the saloon. Her head was covered with a worn, soiled shawl. From underneath the shawl she produced a battered tin pail and placed it on the bar with the phlegmatic remark, "Pa wants a quart of beer."

Mrs. Burke looked at the girl and then at Bingham and then back at the girl inquiringly.

"Are you in the habit of gettin' beer here, child?"

"Sure thing!" the girl replied, cheerfully.

"How old are you?"

"Ten, goin' on eleven."

"And you sell it to her?" Hepsey asked, turning to Bingham.

"Oh, it's for her father. He sends for it." He frowned at the child and she quickly disappeared, leaving the can behind her.

"Does he? But I thought you said a saloon was no place for a woman; and surely it can't be a decent place for a girl under age. Now, my friend, I've got something to say to you."

"You are the very devil and all," Silas remarked.

"Thanks, Silas. The devil sticks to his job, anyway; and owin' to the likes of you he wins out nine times out of ten. Now will you clear out of this location or won't you?"

"Another day like this would send me to the lunatic asylum."

"Then I'll be around in the mornin' at six-thirty sharp."

"You just get out of here," he threatened.

"If you promise to clear out yourself within three days."

"I guess I'd clear out of Heaven to get rid of you."

"Very well; and if you are still here Saturday afternoon ten of us women will come and sit on your steps until you go. A woman can't vote whether you shall be allowed to entice her menfolk into a place like this and at the very church door, but the average woman can be mighty disagreeable when she tries."

Silas Bingham had a good business head. He reckoned up the costs—and cleared out.

(To be continued.)

Cave Life or Civilization

Civilized man is distinguished from the cave man by his habit of co-operation.

The cave man lived for and by himself; independent of others, but always in danger from natural laws.

To the extent that we assist one another, dividing up the tasks, we increase our capacity for production, and attain the advantages of civilization.

We may sometimes disregard our dependence on others. But suppose the farmer, for example, undertook to live strictly by his own efforts. He might eke out an existence, but it would not be a civilized existence nor would it satisfy him.

He needs better food and clothes and shelter and implements than he could provide unassisted. He requires a market for his surplus products, and the means of transportation and exchange.

He should not forget who makes his clothes, his shoes, his tools, his vehicles and his tableware, or who mines his metals, or who provides his pepper and salt, his books and papers, or who furnishes the ready means of transportation and exchange whereby his myriad wants are supplied.

Neither should he forget that the more he assists others the more they can assist him.

Take the telephone specialists of the Bell System: the more efficient they are, the more effectively the farmer and every other human factor of civilization can provide for their own needs and comforts.

Or take our government, entrusted with the task of regulating, controlling and protecting a hundred million people. It is to the advantage of everyone that the government shall be so efficient in its special task that all of us may perform our duties under the most favorable conditions. Interdependence means civilized existence.

PROFESSIONAL Veterinary advice through this department to regular subscribers only. We do not answer veterinary inquiries for the benefit of "neighbors." Parties desiring information will be required to send their names in full with their address. No question will be answered by mail unless accompanied by a fee of one dollar. In order that correct information may be given, the symptoms should be accurately described, stating of how long standing, together with color and age of animal, and what treatment, if any, has been resorted to. Thoroughly good and reliable veterinary remedies are advertised from time to time on these pages. If they were not good and reliable they could not appear in our paper. Our readers are requested to look them over. You may find here some remedy which will exactly fit your case. All veterinary inquiries should be addressed to this office.

AILING ANIMALS.

Ringbone.

I would like some information regarding a lame horse. I have a chestnut western horse, coming nine years this spring, that went lame two years ago when I had him on the road quite a bit. The lameness is in the right front foot. I blistered him several times after that from his ankle down to the hoof and kept him on the farm. After that he seemed to be all right, but a little hard driving on the road makes him limp as badly as ever. I have repeated this four or five times, each time blistering and resting him up, but each time he goes lame on the road.

Judging from your small amount of named symptoms and that you seemingly got some results by the use of blistering, we would be led to think your animal was troubled with ringbone. These causes are sometimes hard to overcome. The radical treatment of firing must be resorted to at times. I would advise you to have a competent veterinarian examine this horse to see if the existing trouble is ringbone.

Loss of Sow After Farrowing.

I had a Chester White sow, two and a half years old, that had eight pigs three days ago. Two of them were smothered, dying shortly afterwards. She was in good condition at that time, ate well after having the pigs, but this morning she was dead, having discharged some blood matter and some afterbirth.

It would be impossible to make a diagnosis of cause of death in the sow with so few symptoms given.

Chronic Laminitis.

I have a black horse, four years old, which was foundered a year ago, or supposed to be foundered. There was no treatment given the first four or five days. He was pretty sore, although he would walk around and did not refuse a light feed. He had fever in both front feet. Then we poulticed his feet in flax meal until the fever left, which I think was about four or five days, and gave him saltpeter in drinking water, advised by a veterinarian. He then appeared to be as good as before. In about six weeks he seemed to be a little sore. On examination we found hoof separated from the heart of the foot and extending upward from a fourth to an inch appeared to be deeper on sides than at toe. There was no matter or discharge. Two months after we noticed the separation we had him shod, having shoes reset once a month until his feet were grown out again. Then we took the shoes off, turning him in pasture for six weeks, at which time his feet appeared in good condition. But when we started to drive him again his hoof separated again as bad as the first time. Two weeks after this we had shoes put on again, which has been about three weeks now. He appears to be a little sore starting, but after that travels well. Hoof is smooth and sound otherwise. Do you know of any treatment that would help?

Your horse is troubled with chronic laminitis and will be hard to treat and expect any degree of success. This case should have been properly taken care of in the first twenty-four to forty-eight hours. You may get some results by having the horseshoer properly trim the feet and then have the horse shod with a bar shoe and leather soles and then blister the region immediately above the hoof once or twice. The blistering will help promote a healthy growth of horn.

Testing Cattle.

(1) How is it that a man has to have his cattle tested before he moves to another state when he can go to the Sioux City market and buy a load and ship them into Dakota or Minnesota without having them inspected? (2) If you call a veterinarian to test your cattle for you can he force you to sell them? Does the state pay for testing if they take the cattle in their hands? (3) Do they have to be tagged when you ship them? And does the veterinarian have to inform them they are coming so they can be on the lookout for them? If so, what are the government inspectors there for? Are they there to protect the packers and soak the innocent farmer?

(1) A shipper must comply with the regulations of the state authorities to which he wishes to send the stock. If the requirements are not the same from the farm to the other state as they are from a center or stockyards where federal inspection is maintained it is evident the state authorities have confidence in the inspection. (2) The veterinarian will not endeavor to force you to sell your cattle that have reacted to the tuberculin test. If he is a friend he will advise you to sell them and if you would serve your own best interests you will do so. The state authorities will do your testing free in case they have authority to do so and have the necessary funds to meet the expense. They do not have to be tagged before shipment, yet the owner would lose nothing if they were. The local veterinarian does not inform the government inspectors the reactors "are coming," yet the owner should not object if he did unless he (the owner) wanted to try to put something over on the inspectors. This would do no good, for if they are tubercular the inspector will find them and dispose of them properly, without any previous warning. A farmer that would try to knowingly dispose of tubercular cattle for food for the public could scarcely be called "innocent." Contrariwise, the farmer that says "my cattle have reacted; inspect them and deal justly by me and the public" can be called "innocent" (of any wrong doing) and will not suffer at the hands of the packers or the government inspectors.

Eversion of Uterus.

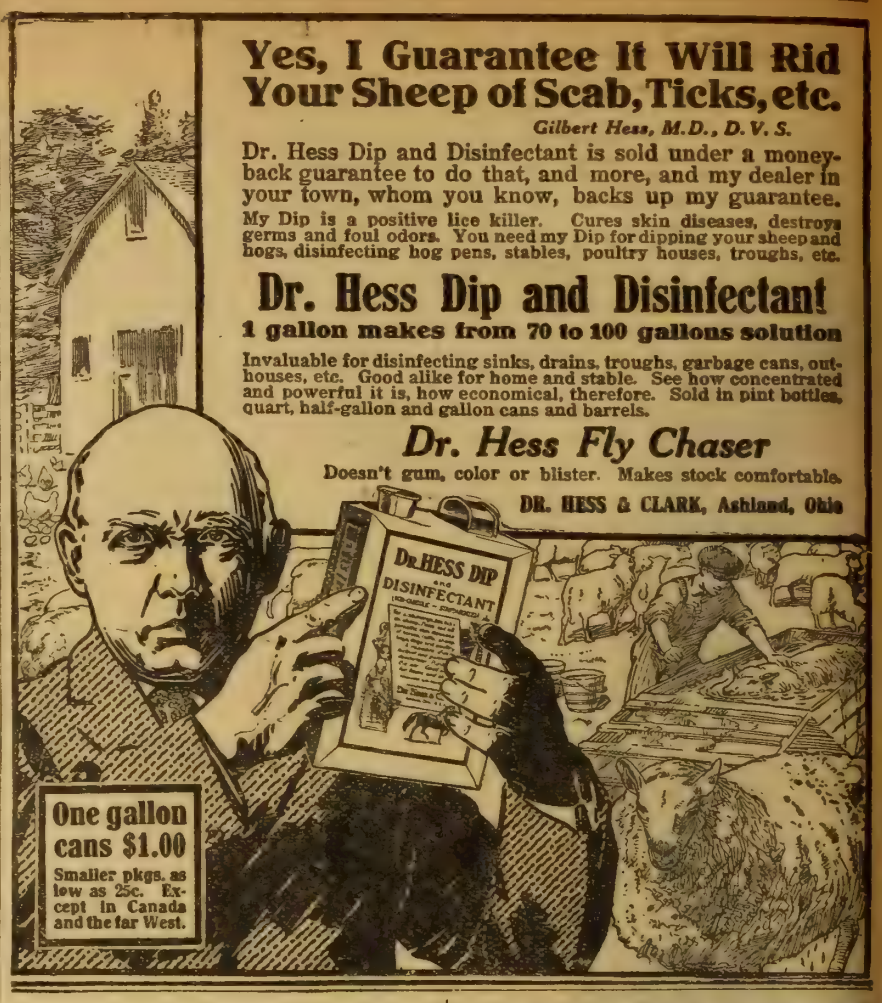
I have a three-year-old cow whose womb came out two days after calving. What treatment should a cow have for this trouble, and what should she be fed? What causes this ailment, and is the cow likely to get in normal condition again?

Eversion of the uterus or womb is brought about through failure of closure of the neck of the womb. An everted womb should be replaced as soon as possible and best be done by an experienced hand. If the womb has been completely everted it is impossible for it to return of its own accord. If it is left for some time the parts become inflamed and swollen to such an extent that the parts cannot be replaced without first cleansing and reducing the inflammation and swelling. A cow in this condition should be fed rather soft and easily digested food and have good care until the system is in good condition again.

Splints.

I have a four-year-old black mare which I broke last spring. After I got the crops in I turned her in the pasture day times and had her in the barn nights on a dirt floor. She had the habit of pawing and had quite a hole for her front feet. I rode her some. She was never shod up to this time. One morning I went to hitch her onto the buggy and I noticed that her left shoulder was swollen and it kept on until it was as big as a milk pail. When this swelling left she was lame and has been lame off and on ever since. I have not worked her any since but have ridden and driven her. Now there is a knot on the inside of each front leg about two inches below the knee and about the size of a marble. Are these knots "splints" or "sidebones," and has the swelling anything to do with this? Is there any cure for these swellings on the side of the legs?

It is possible your animal has splints on her forelegs. We do not think the swelling of the shoulder had anything to do with the enlargements on the limbs. Have you noticed whether your animal is sweenied in the shoulder region since the swelling subsided? In treating splints you should take into consideration several things, such as the following: Are the splints causing the lameness; are the splints large or small; length of standing of the trouble, etc. Splints are of very common occurrence in horses. As a mild treatmen would advise the application of tinc ture of iodine to the affected part several times daily, and if this fail the use of a Spanish fly blister ma prove effective. The actual cauter is a very good radical means to use.



Live Stock and Commercial Field Notes

Collected by Representatives of The Wisconsin Farmer

Sheboygan County Holstein Breeders' Sale.

THE Sheboygan County Holstein Breeders will hold their second annual sale on Monday, May 8th, at Plymouth, Wis. Sheboygan county breeders need no introduction to the readers of The Wisconsin Farmer. They have been carrying a full page advertisement once a month for the past four months, and several herds in the county have been written up by our editors. As far back as 1883 registered Holsteins were being bred in Sheboygan county and it has long been known as one of the largest cheese-producing centers in the world. Dairying is by far the chief line of agriculture, and particular attention has been paid to improving the quality of the cattle on the farms. No pains nor money were spared in producing the best of animals to build up their herds. The result of these many years of constructive breeding is apparent in the herds now in the county. There are some seventy-five herds of pure-bred Holsteins in the county, and 46,000 dairy animals of various breeds. Official testing has been done by a great many of the breeders in the county who have made very creditable records. One breeder in the county has recently made three yearly records ranging from 1,000 to 1,200 pounds of butter. Another breeder has made large yearly records up to 1,200 pounds of butter. Many others have made large seven-day records, as high as twenty-six and thirty pounds of butter in seven days on two-year-old heifers. These are cited as examples of the high production ability of the cows in this county. On Monday, May 8th, the breeders will hold their second annual sale, consisting of seventy-five head of registered animals. The offering will include some twenty-five cows, many with A. R. records, a fine lot of yearling and two-year-old heifers and young cows and a number of choicely-bred bulls from A. R. O. and interested dams. For further particulars in regard to the animals in this sale see address on page 29. When writing for catalog kindly mention The Wisconsin Farmer.—Adv.

Provide a Heating System Now.

IN the damp, chilly days of spring, living in a cold, poorly heated house may cause much sickness and discomfort in the family, and in the summer and fall there are days on which the house should be heated. Right now is an excellent time to put a heating system in your house if you have none. It will be a great convenience on occasional cold days which come in spring and summer and will be in good working condition when cold weather sets in next fall. Stoves are bothersome and uneconomical when compared with an ideal heating outfit. This outfit is easily installed in old or new farm homes and gives a uniform heat of any volume desired. For health, comfort and economy the ideal system is highly recommended by those who use it. Don't put off investigating this system until next fall, but write for the Ideal heating book today. It is advertised on page 7 and may be obtained free by writing to the American Radiator Company, Dept. F-39, Chicago, Ill., and mentioning The Wisconsin Farmer.—Adv.

No Need to Sacrifice Pride or Comfort to Economy.

THE Overland is a small, light, economical car, but it is roomy, sturdy, powerful and complete to the last detail. It has all the style, easy riding qualities and comfort of the big, high-priced cars, but it is sold at the extreme low price of $615. Both exacting pride and strict economy are satisfied in this car. If you want a top class car at bottom price, get an Overland. The success with which it has swept the country indicates that it will please you. See your Overland dealer today or send to the Willys-Overland Company, Dept. 578, Toledo, Ohio, for a catalog. Mention that you saw the advertisement in this paper. See page 32.—Adv.

Truttschel Bros.' Holsteins.

THE records made by Truttshel Bros., Sheboygan Falls, Wis., in the past three years place their herd as one of the foremost in Wisconsin. Last year thirteen cows were put on test most of them two year olds. The thirteen head averaged over twenty-two pounds of butter in seven days. One of them as a two year old made over twenty-six pounds of butter in seven days and this year made thirty pounds. Two others also increased their records over four pounds this year. They are now offering a 26.30-pound bull and a 24.48-pound bull for sale on page 30.—Adv.

The Freeman Ensilage Cutter.

IF you want to know about an ensilage cutter that is inexpensive, operates on very small cost and combines quality and economy, get the free book advertised on page 14 by the S. Freeman & Sons Mfg. Co., Racine, Wis. This book tells their full line of ensilage and feed cutters, carriers and blower-elevators. The Freeman ensilage cutter is well known for its efficient work. If you use silage and are interested in cutters, write for this book today. A letter sent to the address given in the advertisement will bring a prompt reply if you mention this paper. —Adv.

Miller's Chester Whites.

W. F. MILLER, West Salem, Wis., has one of the good Chester White herds in Western Wisconsin. He has been raising Chesters for a dozen years and knows the type that the buying public wants—the big kind with quality. The attraction in his herd is the junior boar sired by the champion, Wykoff Lad. This young boar is out of the ordinary, he has great length, an excellent back, and ideal head and ear and is well grown. We don't know whether Mr. Miller expects to show this boar or not, but if he does someone will have to have a good senior yearling to beat him. The senior herd boar is a son of the noted Combination 2d and he is a worthy son of his grand old sire. The latter boar is the sire of most of the spring pigs and at the time the writer was there Mr. Miller had over fifty early March pigs all doing nicely, consequently he will have some good pigs to offer his trade at a later date. He expected to have over 100 March and April pigs. Owing to the heavy mail order trade that Mr. Miller has enjoyed he is sold out of bred sows and all he has to offer will be his spring pigs to be shipped at weaning time. His Chesters are in demand and he has already booked several orders for shipment at weaning time. If you are going to want Chesters, and wish to buy where you get breeding and individuality it would be well to place your order early, so as to get the pick. Write Mr. Miller your wants, he will tell you just what he has. Don't forget to mention The Wisconsin Farmer.—Adv.

Power in the Paige.

THE automobile with power is the one for the farmer. He does not have occasion to run sixty or seventy miles an hour, but he does have hills to climb and rough places to pull over. He wants to feel as he drives his car that he has a vast store of reserve power at his command and can take the heaviest roads "on high." Then he wants to know that his car is sturdy and staunch—ready to work when there is work to be done. For the farmer's purpose the Paige fills the bill. It has just the qualifications that the farmer wants and will meet his needs day in and day out. Furthermore Paige cars are handsome; their owners make no apologies or excuses; and breakdowns are exceedingly rare with the Paige. Two models are made of this car, a five-passenger Six-38 and a seven-passenger Six-46. They are advertised on page 2 by the Paige-Detroit Motor Car Co., Detroit, Mich. Ask your nearest dealer to show you the Paige cars.—Adv.

Holts' Holsteins.

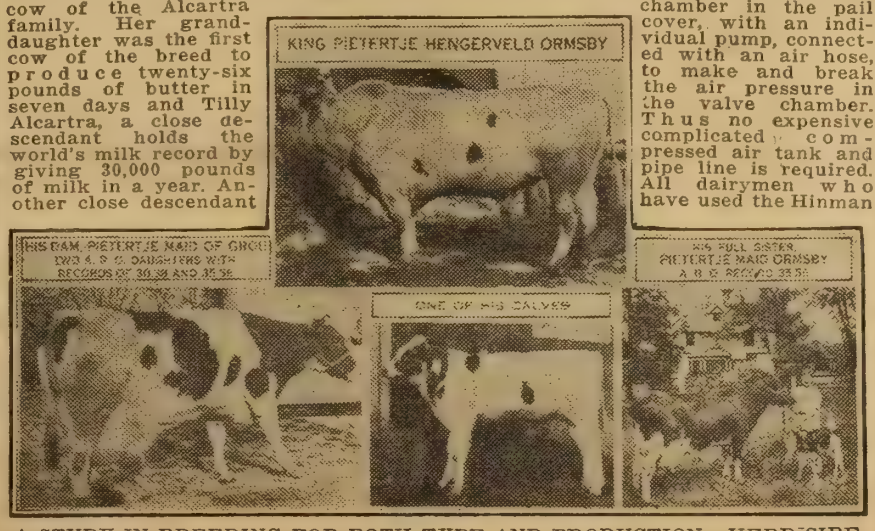
A 21.19-pound Holstein bull is advertised for sale on page 30 by Frank Holt & Son, Pleasant Prairie, Wis. They also have a few others from A. R. O. dams of choice breeding ready for immediate service. Their prices are low and the animals good. Write to them for pedigrees and prices.—Adv.

Currie's Hampshires.

ONE of Wisconsin's most progressive breeders of Hampshire swine is R. L. Currie, Viola, Wis. He has been breeding Hampshires for a number of years and has bred and developed many of the finest animals in the state. When in need of breeding stock write to him. See page 31.—Adv.

A Fine Wisconsin Holstein Herd.

THE Bonnie Mead Farms, Randolph, Wis., herd of Holsteins is one of the oldest and best bred herds in Wisconsin. It was established in 1892 with three choicely bred cows. The offspring of these three foundation cows have proven to be some of the best animals in the breed. One of these foundation cows was Alcartra 2d, the foundation cow of the Alcartra family. Her granddaughter was the first cow of the breed to produce twenty-six pounds of butter in seven days and Tilly Alcartra, a close descendant holds the world's milk record by giving 30,000 pounds of milk in a year. Another close descendant is King Segis Pontiac Alcartra the world's highest priced Holstein bull, a half interest being sold for $25,000. The majority of the cows in the present herd trace to Alcartra 2d. Another of the foundation cows was Wisconsin Belle, There is a long line of her descendants which have made very creditable A. R. O. records. Another foundation cow was Lady Van Beers, of the noted Van Beers family that produced the world's first fonty-pound cow, Johanna De Kol Van Beers. It will be seen that the foundation of this herd was extraordinarily good, and the records recently made by members of these same families show that their judgment in selecting these cows was very wise. The present herd has been buiilt up on these cows and their offspring mated to choicely bred sires. One of the bulls used was Canary Mercedes Royal Sirocco, whose sons and daughters have proven him a great sire. His son, Sir Clyde, has a long list of A. A. O. daughters including three with records from thirty to thirty-three pounds of butter in seven days. Another bull used was Sir Johanna De Kol Wit, a son of the great bull, Sir Johanna De Kol, sire of the forty-pound cow, Johanna De Kol Van Beers. The next bull used was Meg Van Beers Sirocco, a half brother to Sir Clyde. Sir Aaggie Ormsby was then used that is by a brother to Pietertje Maid Ormsby, the world's first cow to make 35.56 pounds of butter in seven days. Sir Aaggie Ormsby is also a grandson of Skylark De Kol Johanna, which makes him of the same line of breeding as Duchess Skylark Ormsby, that recently broke the world's butter record by producing 1507.36 pounds butter in a year. The next bull used was Sir Johanna De Kol 14th, a brother to the forty-pound cow, Johanna De Kol Van Beers. He is also a grandson of Netherland Van Beers, the grandsire of the forty-pound cow, making him 93.75 per cent the same blood as the forty-pound cow. The next bull used was North Star Grisela Sir Beets, a 28.06-pound son of the great show bull, Sir Beets Cornucopia Netherland, that was never defeated in the show ring. Official testing has been conducted for three years in this herd, and daughters of practically every bull mentioned have made creditable A. R. O. records, some as high as twenty-seven pounds of butter in seven days. From the foregoing it will be seen that this herd carries a double cross of the same breeding that produced the great bull, Sir Clyde—the forty-pound cow, Johanna De Kol Van Beers and Pietertje Maid Ormsby, as her full brother is now at the head of the herd. This bull, King Pontiac Hengerveld Ormsby, is one of the finest individuals in the state. His full sister made 35.56 pounds butter in seven days, another half sister made 30.38, another made 33.32 and twenty-six others made from twenty to 29.28 pounds butter in seven days. At the present time bull calves sired by King Pietertje Hengerveld Ormsby are advertised for sale on page 30.—Adv.



A STUDY IN BREEDING FOR BOTH TYPE AND PRODUCTION. HERD SIRE AT BONNIE MEAD FARMS, RANDOLPH WIS. SEE PAGE 30.

Big Farm Bargain Book.

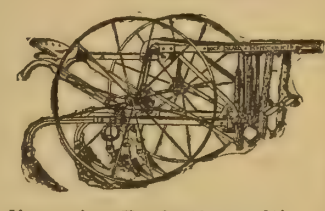
MONTGOMERY, WARD & CO., are advertising a big farm bargain book on page 18, which they want every farmer to have. This book is intended to save the farmer money on everything used on the farm. One of the bargains is a hard, tough spring sheep and hog fence, twenty-six inches high, which will not rust or get out of shape, offered at 23½ cents a rod. Send your name and address for this book today. See the advertisement for the company's address.—Adv.

Milking Machine Efficiency.

PERHAPS the most important reason for the success and efficiency of the Hinman milking machine is the practical, hard-earned experience of the makers of this machine. They are farmers and established their first shop on their farm near Stockbridge, N. Y. Later they moved to a well-equipped machine shop at Oneida, N. Y., and began perfecting the details of their milking machine. From the first they worked on the principle of a valve chamber in the pail cover, with an individual pump, connected with an air hose, to make and break the air pressure in the valve chamber. Thus no expensive complicated compressed air tank and pipe line is required. All dairymen who have used the Hinman milker praise it, because it solves the milking problem. If you have a milking problem, it will be to your advantage to fill in the coupon attached to the advertisement on page 15 and send it to the Hinman Milking Machine Co. You will not be under obligation, but will get some good pointers on practical milking machines.—Adv.

Get this Catalog on Farm Tools.

WE would urge our readers who are planning to buy a new cultivator this year, or who are not satisfied with the work their old one is doing, to get a copy of the Rock Island Plow Company's catalog and read the discussion on perfection cultivators. You will find it interesting and instructive. At the same time you will have a reference book of farm implements. In discussing Perfection cultivators, which have proved unusually popular with farmers, it brings out the self-balancing feature by which the cultivator is automatically balanced when the gangs are lifted, so that the seat remains rigid and the pole does not fly up. Among other features are the easy adjustment by which the cultivator may be used for walking or riding, the absolute control of the gangs with but very little effort, and the absence of levers, rachets and chains which obstruct the view and are cumbersome to handle. The illustration is a reduced picture of the Perfection cultivator shown in the catalog. Send for this catalog today. You will find it a source of solid, practical information. Address the Rock Island Plow Co., Rock Island, Ill., and mention this paper in order to receive a prompt reply.—Adv.



Good Holstein Calves for Sale.

THE Edgewood Farm, Whitewater, Wis., is making an effort to dispose of all its calves this spring. These include both sexes and the price is put at $20 each. Considering the quality of the calves offered, this is regarded as a very low price. It is a good opportunity for anyone wishing to get a start in this breed or to increase their present herd. These calves are sent out at four to six weeks of age and are crated in light, strong crates so that they may be safely and economically shipped long distances. They are guaranteed to arrive in good condition. These calves are bred strictly for heavy milking purposes and the owner gives assurance that they are practically pure Holstein, typical to the breed, although not registered. We request that those who write the Edgewood farm regarding these calves mention The Wisconsin Farmer. See advertisement on page 30.—Adv.

Save Time and Cream.

ON most farms the cows have freshened at this time of year and the supply of milk is greater. This means more cream separating. Besides the spring work is beginning and time is very scarce. Under these circumstances a De Laval cream separator will be of great advantage. All the cream will be saved from this increased milk supply and it can be handled in less time. The De Laval is very simple and easy to handle, also easy to clean and keep sanitary. Because of its ample capacity this separator will do the skimming quickly and efficiently. See your nearest dealer about the De Laval, or if you do not know him, write direct to the De Laval Separator Co., 29 E. Madison St., Chicago, Ill.—Adv.

A Picture Book of California.

TWO trainloads of eastern farmers made a special rail and auto trip in California last fall. They inspected first hand the productive farms and orchards, they traveled among the scenic mountains and broad plains. The sights they saw and the impressions they received have been collected into a beautiful illustrated book. You can get a copy of this book free by writing to C. L. Seagraves, Gen. Col. Agent, A. T. & S. F. Ry., Chicago, and mentioning this paper.—Adv.

Valuable Suggestions to Silo Owners.

SILO owners can get some valuable information and suggestions on selecting a silo filler and on handling silage from the literature of the Jos. Dick Mfg. Co., Canton, Ohio, if they will write for it. This company makes the Blizzard ensilage cutters, which are thoroughly tried and tested machines, and they can give reliable information on silage subjects. Write for their free booklets today.—Adv.

Birchwood Guernseys.

REGISTERED Guernsey heifers and yearling bulls are advertised for sale on page 29 by M. L. Welles, Rosendale, Wis. These were sired by Dairymaid's King 12898, that is a full brother to the great cow, Dairymaid of Pinehurst. This cow made 910 pounds of fat in a year, holding the world's record

at the time. The animals offered for sale are out of A. R. cows of choice breeding.—Adv.

A Guernsey Sale of Importance.

A SALE of Guernsey cattle that should appeal to all lovers of this breed will be held at West Salem, Wis., Wednesday, May 3d. For this sale sixty head of imported and American-bred Guernseys have been cataloged. This will include several cows now in milk, cows and heifers soon to freshen, breeding bulls and bull calves. A feature of the sale will be several cows that have large A. R. records. This offering is sired by some of the noted bulls of the breed. Several individuals are by Imp. Holden 4th 12179, that is the sire of the present world's record two-year-old Guernsey heifer. There will be twenty cows in calf to this bull. There will be several daughters sired by Bob Rilma, the only son of May Rilma, a cow that until recently held the world's record. Cows of such breeding are not often offered in a public sale, but the consignors desire to make this the best sale of Guernsey cattle ever held in the middle West and for that purpose in mind they have selected from the very tops of their good herds. Besides the get of the above mentioned bulls there will be several outstanding individuals by Langwater Princeling and Masher 63d, two sires that have proven their worth in these herds. This stock is in fine breeding condition and they are ready to make good in the hands of prospective Guernsey buyers. All stock has been tuberculin tested. Consignors to this sale are Rundell Brothers, of Hammond and Roberts, Wis., and Alfred I. Stubbs, West Salem, Wis. Remember these breeders are offering you the best they have and not the "tail ends." If you are interested in this breed don't fail to attend the sale. Catalogs are now ready and the same can be had by addressing A. L. Hyzer, sales manager, West Salem, Wis. Kindly mention The Wisconsin Farmer when writing. See page 29.—Adv.

Recent Sales Made by McKevitt Bros.

IF a breeder has "the goods" and will let this fact be known he will have no trouble in disposing of his surplus stock. As we have mentioned before, McKevitt Bros., Bridgeport, Wis., have one of the best Angus herds in that state and we believe we are safe in saying, that they sell more Angus cattle than any other breeder in the state. They have recently been advertising four stallions for sale and we have been advised that they sold one Shire and one two-year-old Percheron stallion to August Stagman, Sisseton, S. D. The Percheron weighed 1,820 pounds the day he was shipped. They also report the following sales of Aberdeen Angus cattle: One bull to Frank Marvats, Eastman, Wis.; a bull each to R. R. Hughes, Rewey, Wis.; Harry Young, Bridgeport, Wis., and Fred E. Foster, Beetown, Wis. To Lou Chouinard, Baylon, Mont., they sold two very choice females. Walter Scott, Bagley, Wis., selected one of their very best bulls. The McKevitts raise good cattle and good cattle are always in demand. If you are in the market for a cheap bull, or some bred heifers that are inferior in quality, don't visit this herd. They cater to discriminating buyers and if you belong to that class, they will try hard to please you. Keep the herd in mind.—Adv.

Spring is Tonic Time.

SPRINGTIME is tonic time, and that's just as true with animals as with the human family. It is a good plan to start now and give all the animals a general toning up. The horses that have been closely stabled and fed dry feed all winter will soon have to get into heavy spring work. Many farm animals are troubled with constipation in the spring and are bothered with worms. For these reasons it is a good plan to lay in a supply of Dr. Hess Stock Tonic and feed it regularly. You will find it a valuable addition to your feeding at this time of year. It is a compound of ingredients that the animal system needs; nux vomica aids digestion, sulphate of soda acts on the bowels and liver, sulphate of iron purifies the blood and expels worms, nitrate of potash acts on the kidneys, etc. Dr. Hess Stock Tonic is a sure cure for worms, which cause serious trouble especially in hogs. See the advertisement on page 26 and ask your dealer for a package of this valuable stock remedy.—Adv.

A Postless Fencing System.

A NEW method of supporting fences is advertised on page 18 by the Carbo Corporation 235 Rand McNally Bldg., Chicago, Ill. This method is claimed to have a great advantage over wood, concrete or steel fence posts. Full information concerning it may be obtained by filling in the coupon attached to the advertisement and sending it to the company. Mention that you saw the advertisement in this paper.—Adv.

A Three-Cylinder Engine for Farm Work.

THE Auto Parts Co., Chicago, Ill., is advertising on page 11 a smooth-running, frictionless, three-cylinder engine which is well adapted to do general farm work. The engine is sold with complete equipment at a bargain price. Read the advertisement and write for the special price offer and full particulars to the address given in the advertisement.—Adv.

Marinette County Asylum Holsteins.

THE Marinette County Asylum, Peshtigo, Wis., have an excellent herd of Registered Holstein cattle. They are very careful in the selection of their breeding stock, using great care and discrimination to get only the best obtainable. At the present time they are advertising young bulls sired by King Walker Segis 3d, Sir Witra Clyde Segis and University Johanna Excelle. They can also spare a few females.—Adv.

Offer Northern-Grown Seed Corn.

THE Adams Seed Co., Dept. 50, Decorah, Iowa, is offering northern-grown seed corn which has tested fine and which is claimed to be entirely satisfactory for Wisconsin and Minnesota farmers. This company has made very careful selection of its seed corn and its offering is on the basis of seed grown in this territory. They state that samples of this corn have been presented to one of the foremost agricultural colleges of the country and they give in their advertisement on page — the results of tests which have been made by this college. Included in the list offered is Wisconsin No. 7, better known to our readers as Silver King, Northwestern Dent, Minnesota No. 13, Minnesota King, and other northern-grown varieties. This company also offers a sworn statement as to where their seed corn is grown. Every bushel of seed sold by them is guaranteed to be as represented in every particular or money refunded. Free catalog of seed corn with price list will be forwarded to anyone who will write to the address given above. Please be kind enough to mention The Wisconsin Farmer when you write. See page 12.—Adv.

Sir Canary Alcartra 78433.

IN order to avoid in breeding A. L. Rowe, Waupun, Wis., is offering his fine herd bull for sale on page 30. This bull, Sir Canary Alcartra, is one fit to head any herd of pure-bred cattle. As an individual he cannot be faulted. He is a large animal, being both very long and deep, with a straight rump and high tail setting. He is nearly white in color, and shows great constitution and capacity. His sire is the noted bull, Canary Paul, which sold three times for $1,000. His dam, Nellie Alcartra Rue, made 874.32 pounds of butter in a year. The bull offered for sale has five A. R. O. daughters with records as high as twenty pounds of butter in seven days as two year olds. Those of our readers who are in the market for an exceptionally good animal should send for the extended pedigree of this bull. In order to make room Mr. Rowe also offers six of his daughters for sale. See page 30.—Adv.

A Self-Oiling Windmill.

A SELF-OILING windmill which seldom gets out of repair is a time and labor saver when compared with a rusty, squeaking windmill that is almost certain to need constant repair. The Aermotor Co., 1125 S. Campbell Ave., Chicago, Ill., make a windmill of the self-oiling type. Its working parts are flooded with oil from the supply in the gear cases which needs replenishing only once a year. A metal helmet or hood covers these parts and keeps out all rain or dust. An old wheel and vane may be attached to the self-oiling motor and provide an up-to-date outfit at small cost. This would be a good thing for the farmer who already has a windmill that is not giving the most efficient service. The company named above has a very attractive folder on Auto-Oiled Aermotors which will be sent to anyone on request. See advertisement on page 16.—Adv.

The Ross Silage Machinery.

THE thresherman who makes a business of filling silos will find it profitable to use the Ross silo filler on account of its low cost of upkeep and rapid work. They are built especially for the thresherman who has steam power and wants a filler that can stand hard, continuous work. Ross silo fillers are sturdily built and free from defects. Models 16, 18, 20 and 24 are equipped with steel cutting apparatus and steel blower. Because of advancing prices you will find it advantageous to buy early. See the advertisement on page 15 and write today for complete information. Address E. W. Ross Co., Box 154, Springfield, Ohio.—Adv.

Mielenz Holsteins.

W. F. MIELENZ, Milwaukee, Wis., is offering a number of richly bred Ormsby bulls for sale on page 30. These were sired by Sir Ormsby Piebe Burke, a brother to the forty-one-pound cow, Sadie Vale Concordia 4th. These bulls are from A. R. O. cows of De Kol Burke Ormsby and Korndyke breeding. For extended pedigrees and further information write to the above address.—Adv.

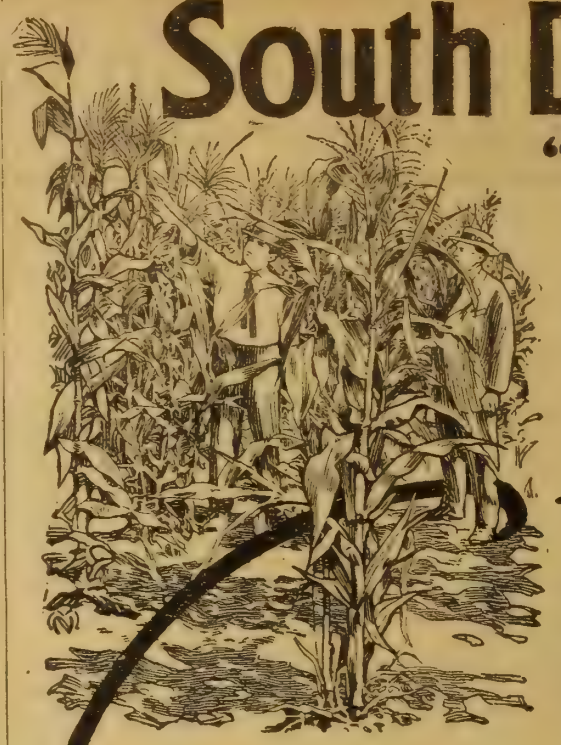
South Dakota:



"the place for a poor man to get a start"

Nowhere else is individual opportunity so great. The Government figures show that South Dakota returns more in value annually to each inhabitant than does any other state. Here thousands of farmers have become well to do in the last few years. Read what some of these farmers say:

"I know of no country where a living can be so easily obtained as here."—"My oats went 60 bushels per acre in 1914. Have now 50 head of cattle and 18 head of horses and do not owe a dollar on my personal property or farm."—"Have 12 head of good horses, 18 head of cattle, 12 hogs and all farm machinery and do not owe a dollar. I had $100 when I moved here."

Many others can give like testimony. These letters and full and reliable information about the state are contained in our Dakota book. Send today for a copy—address

Oct. 19, Geo. H. Willsie, Prosper, Minn.

Richland County Holstein Sale.

The sale of Holstein cattle made by the Richland County Holstein Breeders' Association at Richland Center, Wis., was a success. This was the first sale ever made by this association, and, as is often the case, several of the animals went far below their value. There was a large crowd in attendance and the bidding on the better individuals was spirited throughout the entire sale. Some of the consignors did not have their stock in as good condition as it should have been. C. C. Fries & Son sold a grand lot of heifers sired by their good herd bull, King Pontiac Portia. C. G. Keys had a nice consignment of young stuff. H. A. Brace consigned the animal that topped the sale, number 34 of the catalog going at $400. There was a good demand for the stuff out of record dams and with good breeding and in the future these breeders will have a great call for the good stuff at their annual sales. The men making this sale expressed themselves as being well pleased with the outcome of this, their first sale. Several bull calves, from four to six months old were sold. Col. J. E. Mack, Ft. Atkinson, Wis., sold the offering in his usual high-class manner. We follow with a list of those selling for $75 and over:

C. C. FRIES & SON, RICHLAND CENTER, WIS.

Purebred Registered
HOLSTEIN CATTLE

The annual distribution by the Holstein-Friesian Association of $22,500 in prizes for milk and butterfat records and for exhibitions at fairs has been a great stimulus to dairymen in exploiting the merits of purebred Registered Holstein cattle. Prosperity attends the farmer who wisely buys or breeds these most prolific and profitable of all dairy cattle. Quantity of production and persistency of milking during long periods are characteristic of the hardy Holstein cow. Investigate the big "Black-and-Whites."

Send for FREE *Illustrated Descriptive Booklet.*
The Holstein-Friesian Association of America
F. Houghton, Sec'y, Box 143, Brattleboro, Vt

POLAND CHINA SWINE.

Martiny's Poland China Boars

65 FALL boars of September farrow, sired by Wisconsin Jumbo, the 1st prize and Jr. champion boar at the Wisconsin State Fair, 1914. I believe he was the biggest boar of his age shown that year, he weighing 510 pounds at eleven months old. This will be the last chance to get a herd header from this great boar. The wise man will raise a few fall pigs this year if he never did before. I will sell these boars now for less than they will bring for pork after you get through using them next fall, as I wish to make room for my 100 spring pigs I already have on hand.

L. P. Martiny **Chippewa Falls, Wis.**

Big-Type Poland China Hogs

MARCH boars and gilts, good ones at $20 for 10 days. I will ship on approval. Also Short-horn cattle. Mention the Wisconsin Farmer and address
W. T. Hartley, R. 3, La Crosse, Wisconsin

BIG TYPE POLAND CHINAS

SEPTEMBER pigs of both sexes sired by the great boars, BLACK EXPANSION and KING. Send for description and breeding. Address
JAMES DERIVAN, - Fox Lake, Wisconsin.

LARSON'S BIG-TYPE POLANDS. Am booking orders for pigs of March and April farrow at reasonable prices. Most of these will be from mature stock. J. Le Roy Larson, Iola, Wisconsin.

BIG-TYPE POLAND CHINAS—Growthy September pigs, both sexes at special prices. Address A. Menke & Sons, Route 1, Markesan, Wis.

RED POLLED CATTLE.

RED POLLED HEIFERS AND COWS

OF choice breeding and heavy producers. Bulls of serviceable age and younger. These are very closely related to Corporal, the greatest breeding bull ever in America. Send for pedigrees and prices. Address
UNDERWOOD STOCK FARM
C. C. Underwood, Prop. Avoca, Wisconsin

HEIFERS RED POLLS FOR SALE BULLS

WILL sell a limited number of bred and open heifers and some young bulls. The best of breeding and well grown. Attractive individuals. Write or visit E. L. Bennett, Black Earth, Wis.

RED POLLED HEIFERS

HAVE a choice lot of yearlings, two and three-year-old heifers, bred and open. A few well-bred top bull calves. A great opportunity to buy foundation stock. Correspondence invited.
A. Martin **Gotham, Wis.**

When writing to advertisers please mention The Wisconsin Farmer.

IMPORTERS AND BREEDERS OF

PERCHERON, BELGIAN AND CLYDESDALE STALLIONS AND MARES

STALLION BUYERS ATTENTION. For the next thirty days we are going to reduce our prices on all of our big young stallions in order to close them out. We have a very large bunch of big ton, rugged stallions running in ages from two to six years that must be sold this season, consequently anyone that is looking for a right good one will save money by writing to us and getting our prices and descriptions before buying. We especially have a very strong collection of Belgian stallions, in weight from a ton to 2,300 pounds, from two to five years old, that should be on some good farms the coming season. We also have ten tried sires, Percherons and Belgians, that we have taken in on trade on younger stallions, that we are offering very reasonable.

We are located in north central Iowa on the C. M. & St. P. R. R., midway between Mason City and North McGregor, Iowa. Send 20c in stamps for large horse calendar which shows our main farm and sales stables. Correspondence a pleasure.

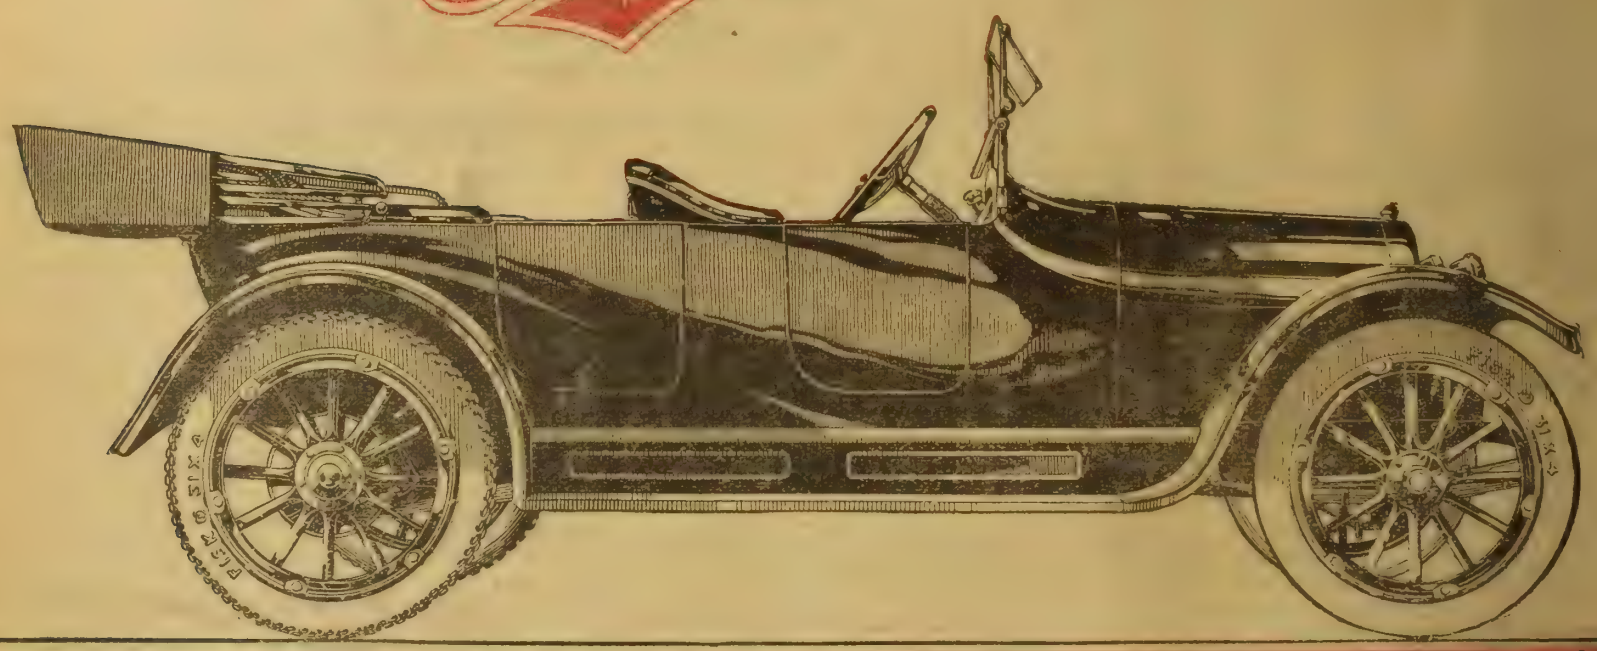
Model 75 - f. o. b. Toledo.

Overland



—so now there's no need to sacrifice pride to economy

This Overland costs only $615.

But it is every inch an Overland—a perfect beauty.

Though a small, light, economical car, it is roomy, sturdy and powerful.

And it is absolutely complete to the last detail.

Never before has a stylish, comfortable, completely equipped car been offered at anywhere near so low a price.

Now for the first time, exacting pride and strictest economy are fully satisfied in one and the same car.

And for easy riding this newest Overland is not to be compared with any other car of its size.

In fact, many a big, high-priced car is nowhere near so easy riding.

It has cantilever rear springs which absorb road shocks more perfectly than any other type.

Large four-inch tires add to its easy riding qualities.

And the seats are soft and deep and built up over long spiral springs.

The seats are also broad and wide—ample in their roominess for five full grown people.

Of course it is electrically lighted and started and the electrical control switches are located on the steering column—right at your hand.

You should have a car this spring—

And if you want top class at bottom price, it must be this Overland, for no other car meets both these requirements.

No wonder it has swept the country—the biggest and quickest success of all our long line of record breaking models.

But one thousand cars a day is the present limit of our production.

That is more than double the capacity of any other producer of cars of this size and class.

But the demand is in proportion to the excess value in this car.

Order yours now to avoid delay.

See the Overland dealer today.

CURRENT EVENTS

THE New York Tribune, one of the nation's oldest and most reliable journals, which, four years ago, was bitterly opposed to Roosevelt, last week came out in favor of his nomination for the presidency at the republican national convention to be held in Chicago in June. The Tribune said: "We are for Colonel Roosevelt because we believe the country needs him. No one else will quicken the pulse of the nation as he will quicken it. No one else will stir the conscience of the people as he will stir it. No one else will inspire patriotism as he will inspire it. No one else personifies the issue which the republican party must make as he personifies it. No one else presents so effective an antithesis to Wilson as he. If we are Americans, real Americans, the colonel is our man. While timid politicians were consulting the census books and counting the German vote, he spoke and the country hearkened. He is the leader in the fight for Americanism and we don't believe in changing leaders when we are going to the front." There is a growing belief that when June comes Roosevelt will be found to be the strongest candidate and that the progressives and republicans will unite upon him. There is much Hughes talk nowadays, but Justice Hughes is known to be perfectly content with his life job on the United States supreme bench.

SENATOR WARREN G. HARDING, of Ohio, has been selected as the temporary chairman of the republican national convention, to meet in Chicago in June. Senator Harding's principal opponent was Representative James R. Mann, of Illinois, whom he defeated by one vote. One of the strongest arguments in Senator Harding's favor, with the committee which selected him, is that he is the only republican senator from the middle West who is not a candidate for the presidency in his own right. He is also the only republican senator, since the 1912 smashup, to have gone to a direct primary and won his nomination, followed by a successful election, in which the republicans and progressives were together. Men in close touch with what has been happening said that Senator Harding's nomination and election to the senate came as a result of a republican-progressive coalition. The day after he was elected temporary chairman Senator Harding delivered a speech in Chicago, in the course of which he said: "It is useless to talk of 1912. I had rather forget it, and let a nation wearied anew by the democratic party join us in four years of happy forgetting. Every essential remains, even the inspiring name; there is every assurance of the concord of leadership, and, more significant still, there is the unmistakable readiness of the people to pledge themselves anew to the republican faith." It is predicted that he will do everything in his power to conciliate both the republicans and the progressives and to unite the various factions of the G. O. P. so as to increase the chances of party victory next November.

HENRY FORD, the multi-millionaire automobile manufacturer, was victorious over Senator William Alden Smith in the Michigan presidential primaries, the voters choosing him as the "favorite son" of that state in the Chicago nominating race. After the returns were all in and Mr. Ford found that he was victorious by some 5,000 votes, he issued a public statement in which he said the victory was one for peace, rather than for himself. He released the Michigan delegates from their obligation to vote for him, saying Senator Smith could have their support if he wished it, as he (Ford) was not in politics. He then announced his intention to return to Europe in May and continue his efforts in behalf of peace. He said: "I'd like to take a vote of the men in the trenches to determine the sentiment for peace. The vote for Henry Ford in Michigan wouldn't be a bagatelle to the plurality peace would get in the trenches. I know the sentiment there. It is for peace. But negotiations must be started before our candidate can be elected. My candidate until Europe's returns come in will be peace. I hope to nominate him. I believe there's a saying in politics, 'He is the people's man.' That's peace." There is no question but that Mr. Ford is sincere in his efforts to bring about peace, although whether anything is actually being accomplished by his propaganda is a debatable question.

THE farmers of Illinois and Wisconsin who furnish the bulk of the milk supply of Chicago (estimated at between 1,500,000 and 1,750,000 quarts a day) were victorious in their strike and have secured the desired advance in price. Hereafter the milk dealers will be obliged to pay $1.55 a hundredweight, an increase of 22 cents over the old price. Whether the price to the consumer will be raised from 8 cents to 9 cents by all the Chicago dealers, or by just a few, has not yet developed. The strike was brought to an end by the intermediation of Health Commissioner John D. Roberson. While the peace conference was being held the district attorney announced he would launch a federal grand jury investigation to determine whether or not either the Milk Producers' Association or the dealers have violated the Sherman anti-trust law, as applied to interstate commerce, by attempting to fix prices. The officers of both associations assert that they will welcome an investigation. The success of the milk producers is convincing testimony to the value of "getting together" in the way of organization and co-operation, one of the most notable victories any farmers' organization has ever won, in securing better prices for farm commodities by united action.

PRESIDENTIAL preference primaries were held in several states last week, but in none were the contests close or exciting. President Wilson has had no opposition whatever in any of the states where the democrats have expressed their preference at the polls. With the republicans, the primaries have been mainly a complimentary vote for certain favorite sons. Thus, in Michigan, it was for Henry Ford. In Iowa Senator Cummins had no opposition whatever and the vote was extremely light, not more than 50,000 republicans in the entire state taking the trouble to go to the polls, while 40,000 democrats contented themselves by voting for Wilson, the others staying at home. In Illinois Senator Sherman won all the state's delegates except two, who will be instructed for Roosevelt. The first ballot at the Chicago nominating convention will find so many favorite sons among the republicans that it will be little, if any, indication of the ultimate result.

THE American troops were still upon the trail of Villa, the Mexican bandit, at last reports, although conflicting rumors have been rife as to their possible early withdrawal. There were reports during the week that Villa was dead, but these were never confirmed. It was rumored that he had been seriously shot in battle, that blood poisoning had set in and that he had died, for lack of medical treatment, there being only one doctor in all the country traversed by him. Just what the troops under General Pershing have been doing for the past week has not been definitely disclosed by the press dispatches, although it is reasonable to assume they are pushing ahead rapidly as possible. At last repo[illegible] the troops were almost 400 miles below the border, maintaining an unbroken line of connection with the headquarters this side the line.

The Wisconsin Farmer

THURSDAY, APRIL 20, 1916.

FAMILY CIRCLE TALKS
BY THE PUBLISHER

LIFE INSURANCE AND THRIFT

I HAVE already set forth my views on the value (necessity would more aptly express it) of life insurance to the farmer. Last week I wrote at some length on the important part which thrift plays in successful lives. Let me take a few minutes of your time now to join these two subjects together.

I have in mind a young man who took out a life insurance policy for $1,000 twenty years ago. He had just gone to the city from the country and had taken the only position which presented itself. The pay was small, but from it he saved enough to meet the insurance premium, which, in his case, was $26 a year. In the twenty years which have passed since then, the way has been uphill and downhill, but never was there a time when this young man allowed his life insurance policy to lapse. At whatever personal sacrifice he saved the money for the annual premium. The other day he received a check from the company for $500. In the twenty years he had paid in $520; he received every cent of it back, save $20, which gave him life insurance protection for twenty years, at an average cost of $1 a year for $1,000. The young man took the life insurance company's check for $500 and paid off the last remaining debt on his home, reinsuring his life for another $1,000, in order to give ample protection to his wife and little ones.

Now, I consider this a good example of the combination of life insurance and thrift. For only $1 a year that young man was protected, for $1,000, against death. Today, he owns his home, free of all incumbrance, the last $500 of the debt having been wiped away by the life insurance company's check. It is a foregone conclusion that had he not taken out a life insurance policy at an early age and determined to save the amount of the premium every year, no matter what happened, he would not be so well and comfortably fixed as he is today. I want my young men readers to consider this matter very seriously; it should cause them to realize that while the annual premium seems large today, if they will only keep at it, year by year, they will get their money back, in time—and in time to enjoy it themselves, too.

Life insurance, industry and thrift: There is a combination which almost inevitably leads to independence and success. The eminent divine, T. DeWitt Talmage, was right when he said:

> The day before or the day after you get married, go to a life insurance company of established reputation, and get the medical examiner to put the stethoscope to your lungs and his ear close up to your heart, with your vest off, and have signed, sealed and delivered to you a document that will, in case of your sudden departure, make for that lovely girl the difference between a queen and a pauper.
>
> I have known men that have had an income of $3,000, $4,000, $5,000 a year, who did not leave one farthing to the surviving household. Now, that man's death is a defalcation, an outrage, a swindle. He did not die; he absconded.

Let me urge upon all my readers that they give this their serious attention; nothing is more important. Let us all be for a preparedness which discounts and dispels the terrors of poverty in our old age and allows us to confront the twilight of our lives without fear of want.

A SERIOUS OMISSION.

I AM quite disappointed to find that the Rainey bill, for the establishment of a non-partisan tariff commission, does not provide for the representation of agriculture. To my mind, this is a very serious mistake. As I wrote Mr. H. H. Gross (the man who is heading the movement to get this bill through congress at the present session), an industry which annually adds $11,000,000,000 to the wealth of the nation deserves to be represented on the commission. I personally know that Mr. Gross believes it is a mistake to leave agriculture unrepresented and that he is hoping the bill will be amended, before it is passed, so as to give the farmers the direct representation to which they are entitled.

I have already written to the congressman from my district asking him to exert all his influence to give the farmers a voice on this commission, which shall substitute businesslike efficiency for partisan expediency in the important matter of revising the tariff. The Tariff Commission League puts the matter admirably when it says:

> For three generations we have worried along under tariffs made for political expediency. Every tariff act during this time has been honeycombed with favoritism, misinformation, twisted facts and juggled classification. None have worked out as promised, and, one after another, they have been repudiated by the people. It is time to call a halt; it is time to substitute scientific accuracy for reckless conjecture, to substitute facts for fancy, and to make tariffs for the benefit of all and not for the advantage of the few. We never will reach a sound, economic basis and make for real, permanent prosperity until politics is taken out of the tariff and the tariff is taken out of politics. It is time to take Mr. Guess-So off the job and put Mr. Know-So in his place.

I want to suggest that every farmer write his congressman, without delay, urging that the provision giving agriculture a member on the commission be restored before the bill is finally passed. We who produce that which is the basis of all national wealth, who are the financial anchor in times of national stress and storm, are entitled to a voice and vote on the commission whose findings will have such weight with the president and congress when Mr. Know-So takes the place of Mr. Guess-So. Write your congressman in regard to this matter without delay.

A SLICK SCHEME.

I AM in receipt of a letter from a grain-belt farmer giving the details of what appears to be a very slick scheme. Inasmuch as I have had reports of the same plan being worked elsewhere in the middle West, and the men may show up almost any place and attempt to interest other farmers in their plan, I am going to set forth the entire letter of my subscriber, who has already lost $120 on the deal, with little or no recourse in sight. Here is his letter in full:

> There are two men here interesting the farmers in concrete fence posts and claiming to be representatives of a concrete mold company. But they sell no molds, just sign up contracts with the agent for a township, then get him to give a note for $120 as a guarantee of good faith, which money shall be full payment for twelve sets of molds when they come, the agent always getting one mold at once. The molds are good, although inexpensive, and the whole affair looks good, barring the price of the molds to the farmers, which is supposed to be $15. The mold actually contains about $2.50 worth of materials.
>
> In a few days back the men come and say, "Here, we had a letter from the company and they are getting anxious to get these molds out among the farmers, so they are willing to give you a good thing if you will help us a little." Then they get you to sign up a new contract, cancel the old one and apply the $120 on a county agency by which all molds sold in the county are ordered through you or, if you want to trust the company and let the township agent order direct from the factory, you get a rake-off from the head office. These fellows are good and fast talkers and can explain away any difficulty you see in their plans, and when you are through you have given them a bankable note for a good sum for a county agency for an article that after more serious thought is too high in price considering the material and labor involved in making, and it will, therefore, never sell well enough to make the agency worth anything.
>
> Now as soon as you have signed the county agency contract they get to town and cash in your note before you have time to have a change of heart. Then when you come to town and want further explanation they "are all right and mean business; you do your part and we will do ours." But you can't get any further without risking more money of your own with them or by helping to get township agents and these in turn giving $120 notes for molds, part of these notes going to you as reimbursement for your good faith notes and part to the company for twelve molds.
>
> Now to get myself square I would have to sign these notes, which would amount to a guarantee if the bank could not collect, which I would never do. There were three of us taken in on this deal here. One's paper proved unsalable and that was lucky for him. I tried to stop my note the second day after I signed, but the banker said I was too late. But it stirred up a hornets' nest. My two neighbors suspected nothing—hadn't even looked at their contracts since they signed them, but they went right after the agents for new contracts, but "nothing doing." These men are still staying here. I do not know what they are doing, as I do not go near them, but I wish I could get at them in some way. I showed my contract to my attorney and explained to him all about the agreement between us, of which the contract says nothing, and he said it looked like fraud to him. He also consulted the state's attorney about it, and he said it was evidently a fraud, but the contract was so carefully drawn th t it would be hard, if not impossible, to get at them without other evidence. A townsman here told me that one of the men evidently goes by two names. The general agent for this company told me that one young fellow cleaned up $4,000 in one year selling these molds. I never believed him, but I thought I would ask you if you ever have heard of this company.

As I view it, both from this letter and from similar reports which come to me from other sections of the grain belt, the trouble is just this: The molds are good, but they cannot be sold for the price demanded, which is six times what they actually cost to make. The farmer who signs up for an agency pays $120 for the rights and for twelve molds, making them cost him $10 each. He finds it almost impossible to dispose of any for a higher figure and thus has the stock left on his hands, while his note for $120 finds a ready market at the local bank. On the face, it appears to be a remarkably smooth scheme, with no recourse in law.

The moral of the incident is not hard to find. It is this: Do not patronize strangers who come to the farm with any "get rich quick" plan. If concrete fence molds are needed, buy them of your local dealer or from a reputable concern which advertises in a reputable paper or magazine. Then, if the molds are not as represented, you have some recourse. The day has passed, never to return, when the farmer could be taken in by any old scheme which looked good on its face but was really valueless. The farmer is a harder man to swindle today than the average business man in the city. Yet there are a few of the smooth-talking gentry left who can make gold bricks sell like hot cakes. They can only be driven to cover by publicity and I am glad my farmer friend has come to me promptly, so that I can print his letter and warn his fellow farmers in ample time. If there are others who have been taken in in a similar manner I wish they would write to me. We can drive the last of the smooth-talking gentry out of the country and out of business if we will counsel together and sound the warning before they can come among us, with their fast, glib talk, which all too often costs us money and makes us the laughing stock of the countryside.

DEMAND FOR WAR HORSES.

THE market for the surplus horseflesh of the farm is quite active again, due to the resumption of buying for the European war and the advertising for 6,200 horses for the cavalry and artillery branches of the United States army. As a result, I predict that many a farmer's bank account, here in the grain belt, will fatten, while farming operations will not suffer materially, as the horses which are being sold are not the best grade, but those which the farmer can well afford to dispose of at the good prices offered, particularly in these times when the automobile and the tractor are displacing the horse to an extent never known, or even dreamed of, before.

The demand for horses by the United States army is the heaviest it has been at any time since the Spanish-American war, eighteen years ago. I am advised that the demand is not a direct result of the Mexican flurry, however, as it is the intention of the war department to build the army up to its statutory strength, 100,000, and to equip the cavalry and artillery branches with the best horses obtainable at present.

While this local demand is in progress the buying of mounts for the European armies has been resumed, British officers arriving in several grain-belt cities during the past week and renewing activities. One day last week thirty carloads of mules, more than 600 head, left the Kansas City yards for Newport News, where they will be loaded for Europe. A day or two later came the first inspection of horses by the British, in this territory, since last November, which, in my opinion, is weighty evidence offsetting the rumors of early peace. A few months ago, when the remount officers were withdrawn from this territory, I hoped—almost against hope, I must confess—that this action meant an early cessation of hostilities, for the war cannot be carried on long without horseflesh, notwithstanding the fact that this is a war of tractors, automobiles and motorcycles as never before. My hopes have not been borne out by subsequent developments, however, and now that the officers are back in our midst I fear it means the war must continue to the bitter end. I might let my hopes for an early peace lead me to believe that the demand for our surplus farm horses was an indication that the warring nations would soon be using them for farming operations, but there is no evidence sufficient to justify this optimistic prediction. I very much fear that the entire summer must be given over to the brutal murder which passes for war and that hundreds of thousands of more brave men must give up their lives before this awful madness is ended. It is a far cry from the peaceful pastures of the grain belt to the shell-riddled fields of Europe. The resumption of horse-buying can hardly have any other meaning than that war is to continue through another harvest—making the third which has seen the golden grain deluged with red life blood, in the awful struggle men are waging across the seas.

James M. Pierce

THE WISCONSIN FARMER

A WEEKLY JOURNAL OF AGRICULTURE, HORTICULTURE, STOCK RAISING AND ALLIED INDUSTRIES

BY JAMES M. PIERCE

JAMES ATKINSON, Editor-In-Chief

ESTABLISHED IN 1848

Entered at Des Moines Postoffice as second-class matter

PUBLISHED EVERY THURSDAY

1912 Grand Ave. Des Moines, Ia. | 201 Washington Bldg. Madison, Wis.

To either of which communications relating to subscription or advertising may be addressed.

MEMBER AGRICULTURAL PUBLISHERS' ASSOCIATION
MEMBER AUDIT BUREAU OF CIRCULATIONS

SUBSCRIPTION RATES—Single subscriptions, $1.00 a year. In clubs of ten, 75 cents a year and an extra copy to getter up of club. In clubs of fifty or more, 25 cents a year. Single subscription three years in advance, $1.50; five years in advance, $2.50; ten years in advance, $5.00. Subscription prices in Canada, $1.50 a year. Remit by draft, registered letter, postoffice or express money order. In changing address, send both the old and new addresses. In renewing, give the same name and initials as you gave before or state both the old and new names, and explain why you make the change. In case of errors or failure to receive the paper within two weeks, promptly notify the publisher. Address WISCONSIN FARMER, MADISON, WISCONSIN

Value of the Silo in Wisconsin.

FARM studies and investigations which have been carried on in Wisconsin in recent years by representatives of the college of agriculture have revealed many interesting things but nothing more interesting than the value of the silo. Farm management results during the past year have disclosed in many instances that the silo has paid for itself the first year in use, and county surveys now in progress are revealing a similar condition.

An investigation in the neighborhood of Omro, in Winnebago county, which was conducted some time ago under the direction of Mr. H. A. Watrud, of Madison, and Mr. Emil Rauchenstein, teacher of agriculture in the schools at Omro, disclosed the fact that the average labor income on farms with silos was much larger than on farms without, and that returns per cow were also larger. Seventy-nine farms were studied in this area, the results of which have just been compiled. These figures and charts show the need of more and better cows; the advantages of the silos and other interesting facts on general farm management and efficiency. Relative to silos the investigation on these seventy-nine farms disclosed that:

The average income on farms with silos was....$419
The average income on farms without silos was. 266
Returns per cow for milk and cream on farms with silo 72
On farms without silos..... 61

Other enterprises on the farms contributing to the income, such as hogs, sale of crops, etc., did not influence the results of each group. The importance of the dairy cow was also seen by the fact that on farms where the milk and cream receipts were the highest the labor income was the greatest. On farms where the milk and cream receipts per cow were on an average more than $70 a year the average labor income was $551; where the receipts per cow were between $60 and $70 the average labor income was $331, and when the receipts fell below $60 per cow the labor income dropped to $134. This tends to strengthen the argument for better cows, while the comparisons between labor income and those farms with and without silos indicate that a good silo is just as necessary as good cows if the farmer is to receive the maximum income for his labor.

A similar investigation was carried out by Mr. Watrud in Port Edwards township in Wood county, assisted by Mr. W. W. Clark, of the county agricultural school at Grand Rapids. Records of fifty farms, all on sandy soil, were kept in this area. These farms were settled largely by artisans and mechanics from large cities and by renters from Illinois. Some were found to be doing very well while others lacked sufficient farm experience, but it was discovered that in this area the average labor income per farm with silos was $194 compared with $94 for farms without silos. Labor income, it must be borne in mind, is the part left to the farmer operator as pay for his time after paying 5 per cent on the investment. Aside from this he has had a home and farm products for the table. An investigation has also been carried on in Walworth county where the production of milk for the retail trade, large condenseries and creameries will have an important bearing on the results, the announcement of which will be watched with considerable interest.

Wisconsin Farmers Must Spray.

NOW is a good time for the Wisconsin orchardist or the farmer with a home orchard to get out his spraying apparatus and be in readiness for the first call to arms against the insects. Every orchard has its insect pests and the large yields; and fine fruit come from those orchards which are sprayed. The pumps and sprays which have been lying idle for several months should be looked over and repaired if they need it in order that spraying may be done at the proper time. This is especially important as the apples, for instance, must be sprayed at certain periods and a delay in getting the necessary apparatus together may mean failure in the end. Elsewhere in this issue Mr. J. G. Moore discusses the question of spraying. He points out the necessity, the time for spraying, the needed materials, etc., and every man not familiar with this subject should read his article.

Many farmers with a few dozen trees do not consider it worth their time to spray. This is a mistake, for the farmer with a dozen trees should desire as good and as heavy a yield of fruit per tree as the orchardist with 1,000 trees. Spraying is not a difficult operation when the operator has the necessary equipment. The important thing is to spray. Secure an outfit of the proper size, whether it be a hand atomizer, an air pressure outfit, bucket pump or a barrel pump. Every fruit tree in Wisconsin is worthy of such attention and it will pay the owner of every tree to protect it against the insect pests which do such a great damage to the fruit crop of this state every year.

Wisconsin Crop Rotations.

CROP rotations are practiced, probably, by more farmers in Wisconsin than in any other state in the grain belt. Rotations have gone hand in hand with live stock farming and a recent inquiry among Upper Wisconsin farmers developed the fact that at least forty out of every hundred farmers in the newer sections follow some form of systematic crop rotation. However, there are many who still hold to the one or two crop methods despite the fact that experience has shown larger yields are to be obtained by following the three, four or five year rotation. It has been possible to support a cow to the acre in Wisconsin on intensely cultivated farms where a sensible system of rotating crops has been carried out. Furthermore rotations lessen the damage from insect pests and fungous diseases.

The most common three year rotation—small grain seeded to clover, followed by clover and then by a cultivated crop—is discussed with other types of rotations in a new bulletin just put out by the experiment station. It is written by Mr. E. J. Delwiche and is entitled, "Crop Rotations for Upper Wisconsin," in which section Mr. Delwiche has had many years of experience. The rotations suggested, however, are applicable to almost any farm in the state although designed primarily for the upper half of the state. Mr. Delwiche, in discussing the advantages of crop rotations, sums it up briefly and concisely in these lines:

Helps to control weeds.
Aids in controlling plant diseases.
Serves to check insect pests.
Increases humus supply of the soil.
Maintains supply of available nitrogen in the soil.
Provides for efficient labor distribution throughout the year.
Aids in keeping soil in proper sanitary condition.
Grows proper crop in proper time and at proper place.
Increases net returns to the acre.
Improves the appearance of the farm.

There are many factors to be taken into consideration in deciding upon a systematic form of rotations as well as in following out the rotation after it has been started. These are all discussed by Mr. Delwiche, and elsewhere in this issue we are making further mention of this subject which is of great importance to the farming and live stock interests of the state.

Wisconsin Sheep.

SHEEP raising is gaining in favor more and more in Wisconsin each year, especially in the upper half of the state, where it has been found profitable to pasture them on the cutover lands, which have been kept clear of second growth. The growing importance of this industry has led to the issuance by the experiment association of a bulletin on sheep raising. It was prepared by Mr. Frank Kleinheinz, the shepherd at the University farms and a splendid authority on sheep raising. Mr. Kleinheinz discusses the subject in a clear, concise manner and at this time his advice on early lambs is particularly timely:

The early lamb is more profitable than the late lamb. A lamb weighing sixty to seventy pounds in good flesh commands a high price on the market in May or June. At this time the lambs will bring about as much, or possibly more, than the same lambs later in the fall when they weigh heavier. The reason for this is the fact that there is a shortage of lambs on the market in May and June. The old crop of lambs has been marketed and it is early for the new crop.

In order to have the lambs at proper weight at an early age, it is necessary to give them something besides their mothers' milk. Lambs will start eating when they are from twelve to fifteen days old. An enclosure should be made at one end of the shed or barn where the lambs can be fed separately. This enclosure can be made quite simply. Take two boards, 1x6 inches, put one on top and the other on the bottom, about three feet apart. Then on these up and down strips should be nailed far enough apart to let the lambs through and yet to keep the mothers inside. Inside this enclosure, a trough should be placed in which a grain mixture of bran, oats, a little oil meal and some finely ground corn meal may be placed. In a separate rack, some good clover or alfalfa hay should be offered to the lambs. It is surprising how lambs can be made to grow and thrive with a little extra feeding.

The bulletin contains much other valuable information for farmers interested in sheep, and Mr. Kleinheinz points out that the old idea that the sheep must carry their fleeces into the hot weather is wrong. When the weather gets warm enough so that there is no danger of the sheep taking cold the fleece should be removed. Sheep are forced to carry their fleece against their will, and often suffer severely from the heat. The owner thinks he can increase the yolk or grease in the wool by late shearing, but as a matter of fact the sheep lose more than the value of this increased grease in body weight.

Wisconsin Looks Good in the Figures.

RARELY do we see a government crop report that does not show Wisconsin in fine shape as compared to some of the sister states or as compared to the nation as a whole. Here are some interesting comparisons in the April report of the department of agriculture:

Condition of wheat in Wisconsin April 1st, this year, 86 per cent. The condition of wheat in the nation as a whole was 78.3 per cent April 1st.

Condition of rye in Wisconsin April 1st, this year, 90 per cent. The condition of rye in the nation as a whole was 87.8 per cent April 1st.

Hog losses from disease in Wisconsin last year, 2.5 per cent. Losses of hogs from disease in nation as a whole last year, 6.63 per cent.

Losses of cattle from disease last year in Wisconsin, 1.8 per cent. Losses of cattle from disease in nation as a whole, 1.96 per cent.

Losses of sheep from disease in Wisconsin last year, 1.7 per cent. Losses of sheep from disease in nation as a whole, 2.16 per cent.

Losses of horses and mules from disease in Wisconsin last year, 1.8 per cent. Losses of horses and mules from disease in the nation as a whole last year, 1.75 per cent.

Barring the last item, Wisconsin shows up much better in the comparison than the general average for all the other states. In Wisconsin last year 0.4 per cent of cattle were lost from exposure. In the nation as a whole the losses of cattle from exposure was 1.07 per cent. Wisconsin shepherds lost 0.6 per cent of their sheep last year from exposure, and the percentage of such losses in the entire country was 2.17.

These figures seem to indicate that farming is pretty safe and dependable in the grand old state of Wisconsin.

Horse Disease From Public Watering Troughs.

THERE is agitation in many cities in favor of abolishing the public watering trough used for horses. This is due to the fact that some of the worst diseases of horses, such as glanders and distemper, are disseminated through the medium of a contaminated trough. Many companies using large numbers of horses absolutely prohibit teamsters from using the water at public troughs, and the teamster that violates this rule suffers the penalty of instant dismissal.

What can be more annoying than to have a bad case of distemper break out right in the middle of spring work? It means loss of time at a critical period, saying nothing of the risk that is involved of losing a valuable animal. We have always supposed that town and city horses developed a sort of immunity from certain types of disease, whereas the country horse, used to the one kind of water most of the time, very easily succumbs to an attack of any of these diseases which horseflesh is heir to.

The danger is easily eliminated by simply taking along a watering pail whenever the horses leave the farm. It is a simple matter to put this in a wagon or even in a buggy, to be used when the water is taken from a public well.

A Cornfield an Expensive Testing Box.

THIS paper has almost nagged its readers about the importance of having on hand a supply of seed corn that is positively known to be vital. Beginning about two months ago, we pointed out the urgent need of making a start on the testing program, and reference was made to the fact that it might be necessary to sort over a great deal of corn in order to obtain a supply of good seed. Upon making inquiry, we find that farmers generally have been diligent in seeking out a supply of good seed so that, after all, the agitation on this important matter has accomplished something.

However, it is possible to find here and there individuals who are trusting too much to pot luck. They have an intuitive feeling that their corn is in good condition, though they are absolutely without accurate knowledge concerning its vitality. To such individuals we would like to say that a forty or an eighty-acre field is a mighty expensive testing box. No man can afford to put his labor on a half stand and it meets the situation in a very poor way to plant corn thickly, thereby hoping to make up in number of kernels per hill what is lacking in vitality. It would be difficult to suggest a worse mess than what results from this kind of planting. No man ever got a full crop of corn by planting four, five or six kernels per hill, because too thick a stand is almost as bad as one that is too thin.

We are referring to this subject possibly for the last time this season, hoping that here and there some of our subscribers will be induced to make one final attempt to test out their seed. As the temperature moderates seed testing becomes a simple matter and it should be possible to determine the vitality of one batch of seed in the course of five or six days. The weak and the dead corn

can be promptly discarded and another supply placed in the tester. In the course of a month one can handle a large supply of corn in this way, and there is no reason why the tester cannot be in service while the ground is being prepared for the crop. It should be remembered that it requires just as much labor to handle a thin stand as a normal stand of corn. On the whole, help is scarce and no man will have a minute to waste this season. It would be much better to plant a forty-acre field with good corn and put in an extra field of small grain than to undertake to grow an eighty-acre field of corn with seed that is not absolutely up to the highest possible standard in its germination qualities.

It goes without saying that testing should be done in the ear while this is possible, because in that way when the tester shows up a dead kernel this means that a thousand others may be discarded when the ear from which it is taken is laid aside. This corn is good for feeding purposes but wholly useless for seed, so that there is no sense in putting it in the ground, only to be followed by going through the trying experience of caring for a thin, scraggly stand of corn.

Catching Weeds off Their Guard.

IF WE had control of weather conditions weed destruction would be a simple operation, but as it is it is a form of warfare in which the one who attacks is greatly handicapped. The methods employed one year, and which gave satisfactory results, may utterly fail the next time they are tried.

Our concern, of course, is with the weeds in the cornfields and, as is the case in actual warfare, the best kind of defense is an attack. For that reason we like the plan of doing the spring plowing early wherever this is possible in order that a crop of weeds may germinate and in turn be destroyed by surface cultivation. There is some advantage if the soil is immediately harrowed after plowing, because this prepares the seed bed for weeds as it were and insures vigorous and uniform growth. A good disking, and particularly a double disking, will effectively destroy every weed enemy that starts, and if the planter is started the next day it is quite likely that the corn will always be ahead of the weeds.

Unless the soil has been impacted by heavy rains after plowing, the harrow will sometimes answer every purpose of weed destruction, but if the soil becomes crusted it will take a weighty implement like the disk to do the right kind of service. Furthermore, such labor as is spent on the ground after plowing tends to bring the soil into an improved condition for corn growth, so that in going after the weeds in the most effective manner our labor has a secondary result that is much to be desired. We are aware of the fact that where there is much cornstalk ground and small grain stubble to plow on any one farm it cannot all be done early. Rush the work as we will, some of it will have to be plowed immediately before planting, thereby giving weeds no opportunity to make their growth in time to work their destruction with heavy implements of tillage. When planting is done immediately after plowing, two or three good harrowings will pay and pay well. Conditions are then ideal as favoring the practice of blind plowing. Some of our best farmers in all their later plantings follow the planter with the cultivator. They throw anywhere from two to three inches of soil over the corn row and then leave the surface untouched until the weeds begin to make their appearance. The harrow is then used religiously, and where there is time the field is gone over at least twice and sometimes three times. This works all kinds of havoc among weeds, and if the labor is performed at the right time you will find the corn peeking through the soil when uprooted weeds are wilting with their white roots in the sun. With this start the corn, with reasonable treatment from this time on, will be ahead of the weed pests so that the work of cultivating can be done much more quickly than will be possible where the weeds are running a neck and neck race with the crop.

Letting Grass Get a Start.

THERE is a strong temptation to turn live stock into the pastures too early. Where stockmen do not have a supply of ensilage they get tired feeding dry fodder. Toward spring this fodder deteriorates until it is very poor rubbish so that the cattle are generally losing in weight just before the grass period. In many cases their hair becomes dry and they have a poverty stricken look, and it is little to be wondered at that they are rushed to the pastures too early.

An Iowa subscriber believes that this is a fatal mistake and in a brief communication calls attention to a little personal experience. He writes:

> It often happens, when you allow your stock to remain in the pasture as soon as the weather is warm, that your pasture never seems to be able to grow faster than the stock eat it. Now, last year, we kept our cattle and horses inside the barnyard and fed them fodder until the grass in the pasture had attained a fair growth. Also, before warm weather, we had spread fine manure over a great part of the grass land, and thus hastened the grass. When everything looked green, we allowed the stock to go into the pasture, and that summer, what with the head start that it received, the pasture never had that close-cropped look of other years, due, I believe, to the chance we gave it for growing a bit in the early spring.

It is very easy to explain why this particular pasture became closely cropped during the entire season. If considerable leafage is allowed to develop this also means a corresponding vigor in root growing. Unless this development is attained early in the season there will be a stingy growth of grass. In case of light rainfall the pasture cropped early in the season will be the first to go and it will be the last to respond to the refreshing influence of late spring and summer rains.

Spraying For the Mustard Pest.

WILD mustard is an annual weed but it almost amounts to a scourge when it once becomes well established. The oily nature of the seed fortifies it against destruction, and if it is buried too deeply in the soil to germinate it will remain there for years so that when it is brought near the surface by tillage implements it springs from the soil in the fullness of its vigor. No man who understands the real nature of the mustard plant will ever let it get possession of his land. Straggling plants should be pulled, though of course this is entirely impracticable when once the soil becomes thoroughly seeded.

At the present time one of our subscribers, Mr. M. Grady, writes for information concerning the matter of destroying mustard by the spraying method. He has to deal with a field that has become thoroughly seeded down with this pest and he realizes that heroic treatment must be given this year or mustard will have complete possession of this land.

Considerable experimental work has been done to ascertain the practicability of destroying mustard by the spraying process. The North Dakota station has been most diligent along this particular line, and the scientists at the South Dakota station have by no means been inactive. For large fields a special power sprayer will have to be used. Some of these are made to operate with the liquid spray under a pressure varying from eighty to 120 pounds. The necessity for high pressure is due to the fact that a sufficiently fine spray cannot otherwise be made. Iron sulphate is the product that is used for this purpose. The general plan for preparing the spraying mixture is to dissolve 100 pounds of this product in about fifty gallons of water. This will make what is known as a solution of about 20 per cent strength. It should be stirred vigorously until all the iron sulphate is dissolved. In pouring this solution into the machine it should be run through several thicknesses of cheesecloth in order to strain out the fibers and add undissolved materials. Unless this is done difficulty will be experienced later in the clogging up of the spray nozzle.

Mustard is sprayed when the weeds and the grain are about six inches high, or just before the mustard plants begin to bloom. Some very good results have been obtained by spraying after the mustard has been blooming for some time. The most effective work is done just after the dew is off on a bright sunshiny day. If a rain soon follows the material is washed off the plants and no good is accomplished. When the work is carefully done the mustard plant leaves will rapidly wither and dry out so that in twenty-four hours they are practically dead. An occasional plant may escape destruction and these should be plucked by hand. Some slight injury may result to the grain from spraying, but when it varies in height from six inches to a foot the bases of the leaves are well protected so that the leaves come on rapidly and soon outgrow the setback received from the spraying operation. It has even been found in some cases that grain is benefited by an application of iron sulphate used for the destruction of mustard plants.

While it is true, as stated above, that spraying for the destruction of mustard has been found more or less practicable, not only in an experimental way but also on a large scale, nevertheless this paper is not enthusiastic about this plan of killing weeds as it applies to the average farmer. We much prefer to recommend the adoption of the kind of farming methods that will keep them out, and even in those cases where pernicious annuals get a foothold, it is entirely practicable to eradicate them by adopting the right kind of cropping methods. Intertillage crops will have to be grown, and even the summer fallow may have to be employed so that by frequently and repeatedly stirring the surface all the seed within three or four inches of the surface will be made to germinate and, in turn, be destroyed. On general principles these farming methods are to be preferred to the other plan.

Value of Forage Feeds For Swine.

ALFALFA heads the list of forage crops for swine, according to the results of extensive tests made at the Iowa Experiment Station. Red clover comes next, after which follow rape, blue grass and sweet clover. Young, tender, succulent blue grass contains from 35 to 39 per cent of protein in its dry matter, though, of course, it is acknowledged that this percentage of high protein content lasts but a short time. In a few weeks it drops down to 25 per cent and there may, during the summer months when it is dry, be as low as 8 or 10 per cent of protein. On the other hand, pastured alfalfa tends to remain more constant in its high protein content, running from 20 to 30 per cent in dry matter, while rape is very similar in the amount of flesh-forming constituents it contains.

In formulating rations for hogs of different sizes the Iowa station recommends corn, middlings and tankage for young suckling pigs, these products to be fed in a self-feeder. If at the same time the pigs are running on good alfalfa or clover pasture they will not eat much tankage.

After pigs are weaned and during the time when they weigh from thirty to 100 pounds, exceedingly satisfactory results may be expected if they have access to a self-feeder containing corn, middlings and tankage, in which case they will consume approximately 95 per cent of corn and 5 per cent of tankage.

After they get older and heavier they will consume even a smaller proportion of tankage and they will make good gains if they have access to corn and takage alone, in which case their ration will be made up of from 96 to 98 pounds of corn and from four to two pounds of tankage. When they reach the 175-pound mark and from that to 300 pounds exceedingly good gains will be made on corn alone. In all cases salt is advised, and usually it is best to feed this product in some sort of a self-feeder.

The above grain rations apply when the hogs at the same time have access to what is known as high-protein pastures, such as alfalfa, rape or tender sweet clover or, on the other hand, short, tender blue grass.

Keep Farm Records.

WHAT does it cost to keep a horse a year? What is the expense connected with raising a colt to the age of two or three years? How much feed is your silo saving annually? What is the difference in the cost of raising alfalfa and timothy on a field for three or four consecutive years? How much milk and butter fat does the average cow in your herd produce annually? How much does your best and how much does your poorest cow produce? Which are the cows that are annually losing money for you instead of yielding a profit? These and many other questions are important, and farmers should be in position to answer them.

It is difficult to get the farmer interested in maintaining records, first, because he considers himself too busy for such things, and second because he can see no material advantage in accumulating data of that sort, much of which will vary with the season. There is truth and common sense in both of these contentions, but let us not overlook the fact that all other business men keep records, and from those records the business policy is largely determined and all are as busy as the farmer. The fact that some records will be influenced by weather conditions is not a good reason for not keeping them. The very fact that certain lines of farm work are greatly influenced by the weather may be a reason for discontinuing or altering them in some way.

To guess at whether this or that pays on the farm has ruined many a man and should be done away with. In guessing one is very apt to forget some of the cost figures. For example, the government has gathered a lot of figures from farmers in regard to the cost of raising a heifer calf till the age of two years. The data collected showed that on the average it cost $62.06 to bring a heifer to the age of two years. The various items entering into this cost figure were as follows: Feed, 65.6 per cent; labor, 12.9 per cent; interest charges, 5.9 per cent; and "other" charges, 15.6 per cent. The "other charges" included buildings, equipment, bedding, etc., and totaled no less than $9.72 for a two-year-old heifer. In guessing at cost figures it is just such items as are included under "other charges" that are frequently overlooked.

Why would it not be a good plan to get up a simple farm record system and let one of the boys take charge of it? Start with one thing. For example, keep an account with the horses. Ascertain the amount of feed consumed, the cost of shoeing, of keeping the harness in repair, etc. Then, too, jot down daily, in some convenient place, how many hours each horse works per day. At the end of a year you will be surprised. You will realize as you have never realized before that a horse is a mighty expensive animal on the farm, and that he does much less work than you used to figure he did. In other words, the cost of an hour's labor will be much higher than you had thought. Such knowledge might lead to substituting mares for geldings or perhaps the buying of a tractor.

A horse account may not be so important as one kept of the dairy herd or of some other enterprise, but we simply mentioned horses as an example. Of course, you might arrange to keep a complete set of farm records, but we fear that would prove too complicated for the average farmer to undertake on the start, and that is why we suggest starting with one single enterprise. As interest in the work grows and its value becomes more apparent the system will naturally expand of its own accord.

Farm prices of hogs, cattle, sheep and chickens averaged 16.4 per cent higher on March 15th than they were on that date a year ago and 12.7 per cent higher than the average of the last six years on March 15th. A report of the department of agriculture says the level of prices paid to producers of the country for meat animals increased 8.4 per cent from February 15th to March 15th this year, compared with an average increase of 3.1 per cent in the same period of the last six years. Prices paid for hogs showed an increase of $1.53 per 100 pounds over March 15th a year ago and 63 cents over the average of the last six years; beef cattle increased 45 cents over last year and 98 cents over the six-year average for March 15th.

WITH CONTRIBUTIONS FROM READERS OF THE WISCONSIN FARMER

Growing and Marketing Potatoes.

To the Editor:—I am very much interested in growing and marketing a better potato and read everything I can find written in that line. I expect to buy a high-pressure potato sprayer this season to spray for blight.

In studying potato culture with the aim of increasing the yield as well as quality I have noticed two methods of raising seed potatoes which appear to be of great value, namely:

1. Several good potato growers in the West make a practice of planting well-matured potatoes late in the season and close together, so as to produce a crop of small, immature potatoes. It is claimed these immature potatoes have more vitality and produce a much larger yield, if planted early the next season, than fully matured potatoes.

2. Potatoes planted under a straw mulch will produce a crop of potatoes that will produce a much larger yield when planted the following season than seed grown in open cultivation.

This second method has been tried out by the Nebraska Experiment Station. In 1904 a plat of potatoes was mulched with straw and an adjoining plat was given careful cultivation. The soil of the two plats was practically uniform and the seed planted was taken from the same lot of tubers. Seed was saved from the mulched and cultivated plats separately, kept under the same conditions during the winter, planted on adjoining plats in the spring of 1905 and given identical cultivation during the summer. In 1906 the experiment was repeated with seed grown in mulched and in cultivated ground the year before. The result of this experiment was that the use of seed grown under a mulch the preceding year increased the yield of potatoes 47 per cent in 1905 and 41 per cent in 1906.

In order to determine whether these methods are of value to me I am going to experiment with both systems and also one other, a combination of the two; that is, if potatoes grown under mulch are better for seed than potatoes grown under regular cultivation, and if immature potatoes are more productive than fully matured potatoes, then it appears to me that a crop of immature potatoes, grown under mulch, would be better for seed than either of the other methods. For that reason I shall experiment in that line also and with the help of our county agent, Mr. R. L. Cuff, I hope to get some data that will be of interest to myself and the readers of The Wisconsin Farmer. Karl T. Hazelberg.

Barron Co., Wisconsin.

Fencing Problems.

To the Editor:—Being a subscriber to your valuable paper I would be very much indebted to your other subscribers for answers to the following questions on correct farm fencing.

I intend to build a legal line fence fifty inches high, with posts sixteen feet apart, and to use woven wire fencing. Will staple fence up two or three inches from ground and one barbed wire will be used on top to make the completed fence just fifty inches high from ground. It seems that the placing of the one wire on top very often spoils the looks of the whole fence. so would like to know the best manner of placing the wire, whether directly on top of the woven wire or some inches above, and if some inches above, how many? Of course, I would not sacrifice looks for a saving in the difference of price between a lower and a higher wire. I have about three miles of fence along roadsides. Should these be built fifty inches high the same as line fences?

In woven wire farm fencing what is the best distance for line wires to be apart?

For best fencing should line and stay wires be all of the same heavy wire, and, if so, what number should it be?

Which is the better mesh, the diamond or square, and which conforms better to the lay of the ground on gently rolling land?

For a square mesh which are better, the welded or movable stays? On some makes the stays are so loose as to very easily get out of shape, which spoils the looks of a fence. Would you advise the six or twelve-inch mesh?

What height and width is best for farm gates between field lots, driveways and barnyards?

Is galvanized pipe frame best and strongest and what size should pipe be? Is the swinging or roller gate best? How are those that can be lifted over snow banks, or to shut up cattle and let hogs or poultry pass under? Does diamond or square mesh look better in gates? What height and width is best for walk gates? Are there any lift walk gates?

In sawing tops of posts off evenly after fence is completed how many inches above last wire looks best?

Wish to paint some wooden posts for use around an orchard. What color would you advise? For around a barnyard?

I believe that many of your subscribers have had enough practical experience in fencing to answer the above inquiries in detail and I hope they will give me this information through the Forum department of The Wisconsin Farmer. Louis Denis.

Brown Co., Wisconsin.

Gold Mine Oats.

To the Editor:—We have had some interesting experiences in raising Gold Mine oats, and I was very much pleased that we were able to be

DE WITT DAMP.

among the prize winners at the last grain show in Madison. We have found the Gold Mine superior to any variety of oats that we have ever raised. I procured my seed from my father about three years ago. He got his first Gold Mine oats from a neighbor some ten to eleven years ago, or the first year they were grown in this neighborhood. This neighbor got his seed from an Iowa seedsman in 1905 or 1906. They have been grown here ever since, have never been treated for smut and are free from it now. They stand up well on our prairie farms and the yield is wonderful.

The land on which my prize-winning sample was raised is a black prairie loam on which corn was raised in 1914, a light coat of manure being applied that spring. After the corn was cut and stacked the land was plowed late in the fall. (I always prefer early plowing.) About the 10th of April, 1915, I dragged the land, worked it up with a seeder, dragged it again and then sowed it with a shoe drill, after which I dragged it again. The seed was thoroughly cleaned and sowed about an inch and a half deep at the rate of two bushels per acre. The oats went down in spots, but not bad. I cut them about the 27th of July and as soon as the shocks were thoroughly dry I stacked them and they were threshed about the 8th or 9th of November. The lodged spots were stacked separately and my sample and also seed was saved from that part of the field which did not lodge.

In preparing the sample for exhibition I first thoroughly cleaned about one bushel, blowing and grading out all of the light and small oats, also chaff, etc. I then worked them by putting in a bag and tramping, care being taken not to overdo this. I then cleaned them again and finally went over the sample by hand and removed all discolored kernels.

Mixing Kerosene With Gasoline.

To the Editor:—As the price of gasoline is getting so it is almost impossible to buy I have a little information which ought to be welcome news to many a gas engine owner and something that will save them many hundreds of dollars.

I have put a second tank to my one and three-fourths horse gas engine, in which I put kerosene. I start the engine on gasoline and after the engine gets good and warm I turn on the kerosene and shut off the gasoline. I find that my engine works just as well on kerosene as it does on gasoline, at least I could notice no difference in the power.

We are paying 30 cents per gallon for gasoline and 10 cents per gallon for kerosene, so this is a saving of 20 cents on each gallon used. Heretofore it cost us 75 to 80 cents for gasoline to do our washing, but the last washing cost 30 cents for gasoline and kerosene together—quite a saving. There is no doubt in my mind that if automobile owners would equip their cars with a second tank they could cut their gasoline bill considerably. I believe they could cut their fuel bill in half and they could run their cars as well on kerosene as on gasoline, after the engine is warmed up.

I hope many of The Wisconsin Farmer readers will find this information beneficial. B. H. Diny.

Brown Co., Wisconsin.

Pet Cock in Intake Tube.

To the Editor:—In looking over the questions and answers in your Farm Mechanics department I noticed someone inquired if it would be advisable to put a pet cock in the intake manifold of a car. I just wish to give some of my experience.

I have a Model 10 Buick with a Schebler carburetor Model D. I could run from ten to twelve miles on one gallon of gasoline. I made up my mind that was too much and thought I would try the pet cock system of using more air and less gas. I bought a pet cock and had it put on, which cost me 35 cents. I now average sixteen miles on all kinds of roads. This has proved a good gas-saving system for me. With a high-speed engine I think they would be of greater value yet, such as Krit or Ford. On Ford cars this system has proven to run on one-third less gasoline than before.

This pet cock should be placed about two inches above the carburetor, with a light rod attached to it running to the dash for opening and closing.

I am not writing this to offend anyone, but just simply to give what has been tried out around home, thinking you might wish to hear of different experiences. Art Knuteson.

New Jackson Model "34"—motor 3½ x 5-inch; 112-inch wheelbase; 32 x 4-inch tires—fully equipped, including one-man top; Stewart Vacuum Fuel System, Springs full elliptic front and rear **$985**

Jackson "34" is One of the Great Cars of the Year

Its motor is a wonder! It is a *four* with all the *economy* of the four, of the high duty balanced type, small bore and long stroke—a veritable miser with fuel.

It develops 38 H. P. And you will notice that on hills and grades it moves along as if it were happy and eager to be tested. You don't have to push it. It gives you that comfortable feeling of inexhaustible power.

It not only has the swift acceleration that means flexibility but it has also the strong, steady pull that means *power*.

So easy-riding that you will wonder why you ever considered *any* car without four full elliptic springs.

And the more you know of Jackson "34" the more convinced you'll be that the motor hasn't a cross grained streak in its system. There's not a chance for disappointment. You'll notice the absolute truth of the Jackson slogan, "No hill too steep, no sand too deep."

Don't buy *any* car till you have had a chance to test out Jackson "34." We believe it is one of the greatest four-cylinder automobiles ever built.

If you want an *"eight"*—there are two of them in the Jackson line. Both have the easy-riding qualities for which Jacksons are famous. *Model "348"*—112-inch wheel base, eight cylinders develops 45 H. P. and is priced at *$1195*. Weighs 2565 lbs.

Model "68" is the big "Jackson"—124-inch wheel base—seats and room for 7 passengers—70 H. P. motor. Compare it with *any* eight at *any* price. And do not forget that the Jackson sells for $1685. Catalogue on request.

JACKSON AUTOMOBILE CO., 1503 East Main St., JACKSON, MICH.

Are The Horses You Own

or drive shod with Capewell nails? For years placed first by the experts.

Not cheapest regardless of quality, but the best nail in the world at a fair price.

The man who takes your horses to be shod should know this too if you are to get the nail which holds best, is safest and saves you needless shoeing bills. Remember it's The Capewell you want.

$1.00 PER WEEK Enough said. Write the Wisconsin School of Telegraphy, Dept. A, Oshkosh, Wisconsin.

Spraying Pointers For Wisconsin.

Time Is Almost at Hand For Earlier Work in Spraying—Rules Suggested by J. G. Moore, of Horticultural Station.

SPRAYING in Wisconsin varies more or less with seasonable conditions. The time is almost at hand for early work of this nature and as a result a circular just issued by J. G. Moore, of the Wisconsin College of Agriculture, is not only timely but very valuable. Most fruits must be sprayed to make possible a good product and Mr. Moore sets forth the necessary treatments for various fruits if the fruit is to be pest free this year. Spraying at the right time and with the right materials is important. The owner of every orchard should spray. It not only improves the character of the fruit, but it also reduces the number of culls to the minimum. The appearance is also improved, which makes it easier to get good prices.

To control scale insects on apples lime sulphur used as a spray just before growth starts is invaluable. However, as growth is now starting it is a little late to use lime sulphur at a strength strong enough to destroy scale insects. The winter strength is five gallons of commercial lime sulphur to forty or forty-five gallons of water, but this strength would damage growing plants or trees.

If plant lice on apples were present during the past season spray with 40 per cent nicotine sulphate, one part to 700 of water (one pint to eighty-seven gallons of water) to which should be added three pounds of soap in solution. Apply just as the buds begin to show green. The above applications may or may not be necessary. The following applications, known as summer spraying, must be made if the best results in producing pest-free apple fruit are to be secured:

1. Spray with a fungicide and arsenate of lead when blossoms show pink. If plant lice are present, add 40 per cent nicotine sulphate, one part to 700 of spray material.

2. Spray with fungicide and arsenate of lead from three to five days after most of the petals have fallen.

3. Spray with same material ten days to two weeks later.

4. Spray with same material about July 20th to 30th, depending upon the section of the state and whether the season is relatively early or late.

If the weather is moist and warm, make an application between applications 3 and 4.

The fungicide used may be either lime sulphur, one and one-half gallons to fifty gallons of water (summer strength) or Bordeaux mixture.

Arsenate of lead is most conveniently used in the powdered form. One and one-half pounds to fifty gallons of spray material will be a satisfactory strength.

Bordeaux mixture is pobably preferable as a fungicide in all applications except 3 and 4, but the present price of the materials may make it necessary to substitute lime sulphur.

CHERRY.

It is not necessary to spray the cherry for scale insects.

Bordeaux is preferable to lime sulphur as a fungicide on cherries.

1. Spray with fungicide and arsenate of lead just before blossoms open, using material of the same strength as for the summer sprays of the apple.

2. Spray with same material when calyx (shuck) falls.

3. Spray with same material two to three weeks later.

4. Spray with same material as soon as possible after fruit is picked.

If aphis (plant lice) are present, spray with nicotine sulphate as directed in the control of apple aphis.

PLUM.

1. Spray with fungicide (summer strength) and arsenate of lead just before the blossoms open.

2. Spray with same material when calyx (shuck) falls.

3. Spray with same materials two to three weeks later.

4. Use a fungicide shortly before fruit begins to ripen.

GRAPE.

Spray with Bordeaux mixture about June 10th and July 1st. Other applications may be made if fungous diseases appear.

Use kerosene emulsion or nicotine sulphate if leaf hoppers or other sucking insects become troublesome.

CURRANT GOOSEBERRY.

1. Use nicotine sulphate, one pint to eighty-seven gallons of water, to which add three pounds of soap in solution, just as buds show green.

2. If aphis are present, repeat in about ten days.

3. Spray with Bordeaux mixture and arsenate of lead about June 10th.

4. Spray with same materials after fruit is harvested.

Arsenate of lead or Paris green should be applied whenever the currant worm is present. Examine plantation at least once a week from May 15th to September 1st for the presence of this pest.

Institutes Next Year.

E. L. Luther, superintendent of farmers' institutes in Wisconsin, advises The Wisconsin Farmer that he is already planning for institutes and domestic economy schools for next winter. Application blanks for the meetings of the 1916-1917 season are now ready to be forwarded to those interested. The usual rules as to placing institutes only where demand and interest is shown, will be followed. Address E. L. Luther, Madison, Wisconsin, for further particulars.

Blasting Soil to Prevent Washing.

To the Editor:—A red shale hill on which corn had been planted lay above the road, or rather where the road had been, for there was eighteen inches of thin red mud over the track. It was out of the question for our car to go through. We backed up past another cornfield and went in to the farmhouse to inquire about another way round. In conversation with the owner of the land it came out that both cornfields belonged to him and that he had been trying to prevent the serious erosion by every known method.

It had been raining for three days, he told us. The results were there to see, before our eyes. In the field where the mud had come from were gullies two feet deep. In fact, both the crop and the field were practically ruined for that year. But the other field showed no washing whatever. There wasn't a gully three inches deep anywhere in it.

This man tried terracing, cultivating with shovel plows to get deep furrows sideways of the hill, cultivating with light weeders to get a smooth, even surface, leaving strips of sod, blasting the subsoil and subsoiling with a regular subsoil plow.

Of all the methods only the two last named showed any measure of success that might be called satisfactory and only blasting showed complete success. On the part of the hill that was blasted the rainwater seemed to soak down into the ground as fast as it fell and then seeped and percolated slowly down the hill at a depth of several feet beneath the surface, coming out in the form of springs and underground water in the low ground below.

The most serious loss in the gullied field was not the time and work it would take to fill the water ruts, but the fertility lost by leaching and washing away. That thin red mud on the road was very rich. It contained the best of what had been on the whole surface of the cornfield. But it never could be used there on the road. It was lost forever to the owner of the land—while the state paid to have it hauled away and dumped into a swamp. J. R. Mattern.

Furnishing Wheat For the French.

From the United States Commerce Report of October, 13th, we learn that the available supply of wheat in France this year will be approximately only 212,830,600 bushels. The average annual production in normal times is 340,529,000 which is entirely consumed in the republic. If the large influx of Belgium refugees this year be considered as partially offsetting the decreased consumption due to the fact that a portion of France is invaded, it is estimated that the total consumption will approximate 312,151,600 bushels. It will therefore be necessary to import about 100,000,000 bushels of wheat representing a value of approximately $180,000,000. Where will this shortage be made up? Not from Russia. Canada is shipping across all she can to England. It looks as though the American farmer who used every means to make two blades of wheat grow where one grew before, and will do the same again, is the man of the hour who will save France the pangs of hunger for bread.

I WILL SEND YOU THIS HANDSOME STOCKMAN'S WATCH FREE

This beautiful special stockman's watch is as handsome a time-piece as anyone could want. It is a genuine New York Standard Watch—both case and movement being American made. It is seven full jewels, stem wind and stem set, with heavy bevelled crystal, double sunk dial, brequet hair spring, etc. The case is genuine nickel silver, handsomely engraved with a locomotive on the back. It is a watch that is specially designed to withstand a lifetime of the hardest and roughest usage and is Absolutely guaranteed in every way.

To introduce MY Stock Tonic to just a thousand more readers of this paper **I am going to give away** one thousand **magnificent Stockmen's Watches—Absolutely Free**—I'll send them at once—**to the first thousand readers** of this paper who send in the coupon below. With this watch I will also agree to send a big trial feeding of

WILBUR'S STOCK TONIC the Greatest of All Live Stock Conditioners.

What is more, I will send you this Stock Tonic with the **distinct understanding** that it is to be used for **two whole months at my risk**—that if at the end of two months feeding the Stock Tonic has not been entirely satisfactory **no charge is to be made.** I simply want you to make a two months' trial of my Stock Tonic with the understanding that **if it does not fatten up your live stock—kill the worms—that if it has not paid you to feed it**—no charge is to be made. Then as a special inducement and to pay you for the trouble in making the test I will give you—Absolutely Free—one of the Stockman's Watches shown above.

I Will Prove To You

that my Stock Tonic will positively **rid your live stock of worms, fatten them up and keep them in the pink of condition.** I will prove to you that you will actually get **more milk from your cows,** that you will **fatten your hogs, steers, sheep and poultry** for market in less time, that you will **save grain, prevent disease and make more money from each animal you own.** I have such absolute faith in Wilbur's Stock Tonic that **I take all the risk** in this trial feeding.

There Is No Secret About This Tonic

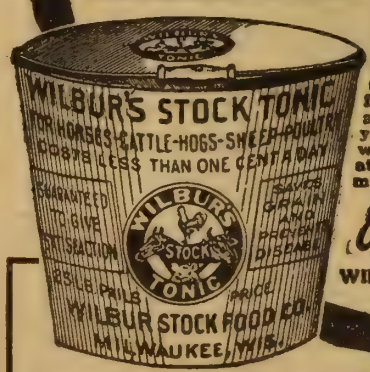
It is composed of twelve separate ingredients—plainly printed on every package—each one carefully selected and absolutely pure. These ingredients are acknowledged by veterinarians everywhere to be the **finest tonics, appetizers, digestive aids and worm dispellers known to medical science.** Each one has a special purpose. A compound of these herbs, roots, etc., is absolutely sure to **condition any animal—keep the blood clear—the system free from worms and disease and force the animal to put on fat rapidly.** I have proved it so often **there is no doubt about it.** I have made and sold this Tonic for over thirty years and over a million of the best stock raisers in America are feeding it every day—I have thousands upon thousands of the finest kind of letters from all parts of the country telling me of the wonderful results from feeding this Stock Tonic. Now all I want to do is to **show you that what it will do for others it will do for you.** And as a special inducement just to get you to make this trial—at my risk—**I am going to send you one of the handsome Stockman's Watch.**

This Handsome Watch is Yours—FREE

It never costs you a cent. It is yours—forever—to keep and use every day—**whether you ever pay for the trial feeding of Tonic or not.** It's a handsome, dependable, fully guaranteed timepiece—would cost you $6.00 to $8.00 in any store. A watch you or any one will be proud to own, and **remember, it's free.**

E. B. MARSHALL, Pres.
Wilbur Stock Food Co., 983 Huron Street, Milwaukee, Wis.

Please send me at once one of your **Stockman's Watches.** Also send me 4 25 lb. pails of Wilbur's Stock Tonic. I agree to feed the tonic as directed for two months, and if it does what you claim, I will pay you for it at the rate of only $2.00 per month until I have paid $14.00. If it fails and I so report in sixty days, **you are to cancel the charge and I will owe you nothing.** You are also to ship me—**FREE**—enough **Wilbur's Poultry Tonic**—your guaranteed egg producer—to offset all freight charges on the shipment. **It is understood that the Stockman's Watch and this pail of Poultry Tonic are to be mine—Absolutely Free—whether I pay for the Stock Tonic or not.**



Simply Fill Out The Coupon

SEND NO MONEY. Just find out by actual test on your own stock that **my tonic will make money for you.** I have a watch all ready for you if you send that coupon right away. **You can't possibly lose anything—you have everything to gain. Isn't it worth a postage stamp? Do it now—at my risk—fill out the coupon and mail it to me at once.**

If you already know what Wilbur's Tonic will do and do not want the trial offer but wish to sell a few pails to your neighbors, making a little money in addition to this Watch Free place an X in this square and we will tell you how you can easily sell your extra pails. ☐

Agents Wanted to sell Wilbur's Stock Tonic, Veterinary Remedies, Extracts, Spices, Medicines, etc. We pay liberal commission and equip you with a **Ford Automobile Free.** No capital or experience necessary. We furnish everything. Write for details of our plan. Address Desk K Wilbur Stock Food Co., Milwaukee, Wis.

MAKING HOUSEWORK EASIER.

Farm Girls' Training in Cooking and Sewing, Kitchen Economics and Sanitation, as Taught in the Agricultural School of Today—By Mary E. Pease, of Milwaukee County.

THE farm woman of today needs the help and aid of science and education much more than the city dweller, because of the lack of means and conveniences which have year by year become a part and portion of city life.

The real farmer realizes more and more the fact that washing machines and vacuum cleaners are as much necessary accessories for the home as are the threshing machine and tractor for the farm. Each in its particular environment accomplishes a greater amount of work, with much less expenditure of energy than was necessary by the old-fashioned method. The one makes more efficient the work in and around the house; the other helps produce the maximum results in dollars and cents from a certain number of producing acres.

The first steps in assisting in the work of the farm household are in teaching the girl or woman to use intelligently what she now has, and from time to time to learn of those things which will make her work more endurable and enjoyable, and to purchase them in the most economical way.

Farm schools are now being started throughout the United States more rapidly in some sections than in others, perhaps, as necessity demands. The Milwaukee County School of Agriculture and Domestic Economy is one of the best examples of this type of school in Wisconsin. The girls who attend this as well as others of its kind, come from the farming districts of the county to learn what they can about making their work easier and pleasanter and to make their homes better and happier.

The first year in such institutions the girls are taught the fundamentals of sewing and cooking. Instead of the old-fashioned, laborious method of basting seams in dressmaking, they are shown how to substitute pinning. This is one of the many ways they learn to get better results by easier and quicker methods.

The same idea of economy of time is carried out in the kitchen, teaching the future mothers of America how to collect material for a cake, mix it, bake it, and have the dishes all cleaned up in ten minutes.

In so far as it is practical, they are taught to make use of the dishes as they are ordinarily found in their own homes, but when, for a single expenditure, some tool or utensil can be purchased which will save time and energy economically, it is made use of in the laboratory to show just why the saving is worth the expenditure. The egg-beater, the spatula and the frying basket are very good examples.

Again the pupil soon discovers that in order to get good results every time, a certain amount of care must be exercised in making the particular article under consideration. The necessity for accurate measuring cups, spoons, and other cooking utensils in cooking, and tape measure in sewing, soon becomes apparent, as does also the necessity of their accurate use.

After the first year of learning and experience in the best and easiest ways of doing the work of the housewife; cooking, sewing, laundry, etc., the girls are then ready for the more difficult problem of keeping house in the easiest and best ways. No one learns all in school, but the preliminary instruction teaches the worker to watch for methods of eliminating unnecessary drudgery and expense in her future work.

Sometimes the housewife wastes her energy, becomes tired out, and cannot accomplish her task because she does not perform each individual portion of the work in the easiest or most economical way, from a labor standpoint. Maybe it is because she failed to plan her work as a whole, intelligently.

Once the easy way is discovered, a task should always be performed in that way, until the action becomes automatic. As a habit, work is not laborious. If you have ever watched a little child just learning to dress herself you will see the reason. First, she picks up her undershirt and that goes on all right. Then she sees her petticoat, so she puts that on and laboriously buttons it, for the task is new. Then she discovers she has forgotten her underwaist and drawers, so off comes the petticoat. All those wasted moments and all those wasted motions are what makes it a hard task.

If the housewife starts the dishes, remembers she hasn't opened the beds to air and runs upstairs for that, she not only has the extra trip but the wasted time from her dishwashing to account for. Then the water gets cold, and has to be reheated and she is again delayed. While she makes the beds she remembers she hasn't fed the chickens and she stops for that. Another extra trip is the result.

The girls are taught to plan their work so the least energy and the least time are lost and the least fuel wasted that is possible. The upstairs work is all done at the one trip. The downstairs work is planned to fit in most conveniently and the plan is written out. These plans are brought to class and criticised. Sometimes after a discusion they are changed and improved. At times the discussion brings a firmer conviction that the plan as outlined is best without change.

On Saturdays the girls are urged to follow out their plans at home in order to demonstrate that they actually prove efficient. The routine or daily "ever present" work is thus systematized. The housewife loses no time wondering which task to take up next. The dishwater is hot when needed; the beds sufficiently aired when it comes time to make them. Furthermore the mind of the housewife is free to think of other things. She never bothers her head as to how she washed the dishes, any more than she actively thinks how she walks around. Her hands learn to wash the dishes just as her feet learn to walk without constant supervision being a definite task for the brain.

Interruptions will occur from time to time in the routine of the work, such as answering the phone or the door bell, and many other distracting things. But the girl with a system will soon discourage lengthy chats over the phone during her morning work hours, and will quickly, yet courteously, dismiss the peddler who may have something she does not want.

After the girls have completely worked out plans for managing their own work in their own homes, they outline in detail a plan for a young girl going to school and living in the the practice flat of the school. A complete list of the work for the home and a time allowance for the getting of the girl's regular school work and attending her classes, is made. When the student is satisfied that the plan is correct and complete, she is allowed a week in the home to see whether or not it will work out in every way.

These girls when they go to their homes, help to rearrange work in their mothers' kitchens so that the work will be easier, and they have a great deal to do with persuading their fathers to purchase the necessary articles to help put in their plans.

Another course taken up in conjunction with their work takes as a model a family of five in which the mother does all her own work. A plan is drawn for a complete house, taking into consideration the arrangement of all rooms, and the furniture in them, also step-saving devices of many kinds, which in actual experience have proven themselves worthy of adoption.

The arrangement of sink, stove and table in relation to the icebox, cellar steps, dining room, etc., is carefully studied and laid out to permit the maximum amount of work with the minimum amount of energy. Steps are energy, and a few saved during the day makes life a lot more livable.

Simple devices like a dumb waiter

Methods of Clearing Stump Land.

"Land-Clearing Limited Will Acquaint Farmers With the Best Methods of Removing Stumps and Brush.

SETTLERS in Upper Wisconsin are interested in nothing so much as land clearing. This subject ranks first in their estimation, for as soon as it is practicable they want to clear much

A JOB SUCH AS LAND CLEARING SPECIAL WILL TACKLE.

of their farms of the stumps. To answer this need the college of agriculture will co-operate with railroad and manufacturing companies in May and June in the operation of a series of land-clearing demonstrations.

To accomplish this the "Land Clearing Limited" will be operated through eleven counties in Upper Wisconsin. It will consist of six cars carrying a number of different styles of stump pullers and dynamite blasting apparatus for demonstration purposes.

The train will start from Madison, where it will be equipped under the direction of the department of agricultural engineering. Six companies engaged in the manufacture of land-

A HANDY DYNAMITE KIT FOR THE FARMER WHO HAS LAND TO CLEAR.

clearing machinery and explosives will supply apparatus and aid in the demonstrations. From Madison it will be sent to Mountain, Oconto county, where the first demonstration will be made, lasting, as will the others, for two or three days. The work will be done on a plot of about ten acres of land as near the tracks as possible. Local arrangements will be in charge of county agricultural representatives, bankers and business men.

The other points in the itinerary are: Deerbrook and Elcho, Langlade county; Crandon, Forest county; Three Lakes, Oneida county; Eagle River and Woodruff, Vilas county; Bayfield and Ashland Junction, Bay-

ONEIDA COUNTY TRACTOR AT WORK CLEARING LAND.

field county; Hayward and Radisson, Sawyer county; Bennett, Douglas county; Spooner, Washburn county; Barronette and Rice Lake, Barron county; Cornell, Chippewa county.

Prices, cost of operation, methods of engineering, plans for co-operative associations and all such subjects of interest to land-clearing workers will be taken up and discussed. The men in charge of the train will be in their shirt sleeves from morning to night and always ready to answer questions or take part in demonstrations. The opinions of settlers on homemade devices for land clearing will be noted and where feasible such machines will be given a trial.

Communications in regard to the train and its work will be given attention if directed to the college of agriculture, Madison.

The companies which have promised to co-operate in the work are: Bay Iron Works, Bayfield, Wisconsin; George Drazick, Escanaba, Michigan; E. I. Du Pont de Nemours, Chicago; Flynn Stump Puller Co., Superior, Wisconsin; Hercules Manufacturing Co., Centerville, Iowa; A. J. Kirstin Co., Escanaba, Michigan.

The demonstrations will give a good idea of the several methods of land clearing which may be classified as follows:

One-Man Hand Stumpers.—Several types of more or less merit in use in the lake states. Good for soft ground or where the "down stuff" is too thick for horses to work well. Cost, from $15 to $200.

Horse Stumping Machines.—Have been improved for quicker and easier operation. Two varieties in common use—the capstan and the tripod. Horse stumpers and pilers are used together. The stumpers range in price from $20 for the stripped machine to $500 for a complete puller and piler.

Dynamite, alone and in combination with power stumpers, has a recognized place in land clearing operations in Wisconsin. The cost varies with the kind used, which in turn depends upon factors of soil and the resistance of the stumps. If rightly used dynamite will serve a wonderful purpose in helping to clear Upper Wisconsin.

Steam Stumpers.—A success where the soil is light and working area is large. To work to best advantage these machines must have a crew of from five to eight men. Large investment involved, sometimes as high as $16,000. Best adapted for community land clearing work.

Tractor Land Clearing.—Some cheap clearing has been done by operators in this state who have converted their tractors into land clearing machines, running them upon a heavy frame work which rests upon skids. A double drum hoist and piling boom is attached to the forward end of the skids. This is driven by a chain belt from the sprocket wheel fastened to the flywheel of the tractor.

Gasoline Stumpers.—Gaining popularity rapidly, and are being made with and without stump piling devices. Light enough to be easily moved by horses, do not require a large crew, and will pull the strongest stumps, when aided by small quantities of dynamite.

POTATOES WILL GROW BETWEEN STUMPS AS WELL AS IN OPEN LAND.

The spring maintenance of earth roads requires preventive measures, which must be taken the previous fall or summer, so that the road will go into winter properly graded, well compacted, and with good provisions for drainage.

Lessen Your Road Tax

EVERY mile of road is a tax on your tires. Upon tire quality depends the amount of road tax your tires pay. Firestone Tires give you "Most Miles per Dollar" —less tax—greater mileage. This added value is due to Firestone Extras. Extra toughness, extra resiliency, extra thickness of pure rubber tread.

The new Firestone Tires with their red side walls and black treads give promise in appearance of the good service they will give in actual use.

Quality alone—proven by "Most Miles per Dollar"—has produced the demand that has made the Firestone plant the largest exclusive tire factory in the world.

FREE OFFER. Send us your dealer's name and address and the make of tires you are now using and we will send you, free, a waterproof tube bag. It will keep your extra inner tubes in good condition. Write today and ask also for free book, "Care and Repair of Tires," No. 17

MONTANA

Is the Country of Opportunity for Ambitious Young Men

DON'T let your boys go to the city—keep them in the country where their health and morals are both preserved and make them successful and independent farmers, owning their own farms and sharing an interesting community life.

Montana is the place for young men. Here millions of acres of good farm land that can be bought at small cost await the plowshare to convert them into the finest grain land. Soil is fertile—climate ideal. There are good schools and churches—everything that makes for a happy community life.

Learn more about Montana—send for illustrated descriptive literature—then next spring buy a round trip excursion ticket and go see this wonderful country.

SUBSCRIBERS who desire questions answered in this department should base them upon a brief, plain, concise statement of the actual facts. To insure immediate attention, inquiries should be addressed to "The Legal Department," in care of this paper; but as the inquiries sent are at times very numerous, thus delaying printed answers, those to whom it is important to receive an immediate reply by mail, should remit $1.00, addressed as above. All inquiries must be signed if they are to receive attention.

Lending Personal Property

When a person hires from another the use of a team, carriage, wagon, auto or other article of personal property for a certain period of time he is entitled to the possession of such property till the time expires, even as against the real owner. Such right is similar to the right of a renter who has leased land for a certain period of time. The relation of the lender and borrower involves mutual benefit and advantage to both parties, the borrower receiving the use of the property so hired and the lender receiving compensation for such use. The borrower is bound to use ordinary care and diligence in preserving the property and is liable only for negligence. He is required by law to take care of such property with that degree of diligence which prudent men ordinarily use in caring for their own property of the same kind. For instance, if a man hires a team he is bound to drive it with moderation and treat it as carefully as men of ordinary prudence would treat their own animals of like character and to furnish proper food and shelter, and if he does this and the team becomes injured or lamed while in his possession without his fault he is not responsible to the owner for damages, but he may become liable for damages by reason of injuries caused by the negligence, carelessness or fault of his children or employes.

If the thing hired is injured or lost by inevitable accident or superior force, without any fault on the part of the borrower, he is not liable for damages. The owner is not responsible to third persons who may be injured by the negligent use of the thing hired by the borrower nor for the negligent use of it by the employes of the borrower.

The owner or lender need not look solely to the borrower of property for damages on account of injuries or wrongs done to it by a third party. If a borrower assumes to sell or pledge the hired property as his own it amounts to a wrongful conversion and the owner may immediately bring a suit of replevin against the third party who has possession of the property. The borrower may sue a third party for an injury done to his actual possession of the hired property and may include in such suit a claim for damages for all injuries done to the property, being himself accountable for the same to the owner. The owner may sue a third party for any permanent injury done by him to the property while it is in possession of the borrower and recover damages to the extent of the depreciation in value caused by such injury.

Where a person lends an animal or other article of personal property to another merely for accommodation and without compensation the transaction is not like hiring, but wholly for the benefit of the borrower and he is for this reason held accountable by law for the highest degree of care and diligence in caring for and preserving the property and returning it in good condition to the owner. The borrower who pays nothing for the use of such property is liable for all injuries to it while in his possession which arise from any neglect or carelessness on his part, however slight it may be, but he is not liable for injury or loss which occurs wholly without his fault. The borrower is liable for all ordinary and necessary expenses of keeping the property in good condition while in his possession, but he is not liable for extraordinary expenses unless caused by his misuse of the property. For instance, if a borrowed farm implement, like a reaper, mower, plow or wagon, should need slight repairs, made necessary by ordinary use, it would be the duty of the borrower to furnish them at his own expense, but if a borrowed reaper should break down in the field or lose a wheel by reason of some defect in it and without any fault or negligence on the part of the borrower he could not be held liable to the owner for the expense necessary to put the machine in working order.

LAW QUESTIONS.

Cutting Bee Tree on Another's Land.

A Subscriber, Bertha, Minn.—I have traced the line of a wild bee to the hive in a tree located on another man's land. Can I cut the bee tree and take the honey without the owner's consent, under the laws of Minnesota?

Answer.—You cannot do so under the laws of Minnesota or any other state. Such an act would be a trespass upon the property of the owner, for which he could recover damages from you and possibly prosecute you for a criminal offense.

U. S. Stamp Law.

A Subscriber, Upham, N. D.—(1) Can a note without a United States revenue stamp on it, be collected by law? (2) Who should put a stamp on a note and cancel it? (3) When a note is found without a stamp, who is liable and what is the penalty?

Answer.—(1) If such note was given after the first day of December, 1914, it cannot be collected by law. (2) The person who gives a note should put the stamp on it and cancel it. (3) The person giving the note is liable and the penalty is a fine of $50.

Damages for Misrepresentation.

A Subscriber, Cresbard, S. D.—A bought a team of horses from B for a certain sum of money, and at the time of the sale B represented the horses in the presence of two witnesses, to be sound in every way. After taking the horses home, A found that one of them was lame and unsound. What can A do about it by law?

Answer.—A can sue B for damages and get a judgment against him, for the difference between what the lame horse is actually worth and what he would have been worth if he had been a sound horse.

Damage by Automobile,

A Subscriber, Oconomowoc, Wis.—(1) Where the driver of a horse, or animal drawn vehicle on the public road will not turn out to give half the road to an automobile which overtakes it, and the driver of the automobile wishes to pass, can he lawfully run slowly against or into the foremost vehicle to cause it to turn out? (2) In such a case, would the driver of the automobile be liable for any damage he caused to the other vehicle or its occupants?

Answer.—(1) He cannot lawfully do so. (2) The driver of the automobile would be liable for any damage done by him to the other vehicle and its occupants.

Exempt Wages, Limitation on Note.

A Subscriber, Correll, Minn.—A sold B an accident insurance policy and took his note for it. B has nothing whatever except what he earns as wages for his labor. (1) Can A take B's wages to pay the note? (2) How long does a note stand good in Minnesota? (3) If B leaves Minnesota and goes to work in another state can his wages there be taken to pay the note?

Answer.—(1) B can claim his wages to the extent of $25 earned in the thirty days preceding an execution or attachment, exempt from execution and attachment. (2) Six years after it is due. (3) It depends upon the laws of the state to which he goes—you have not specified the state.

Verbal Contract Not Valid.

A Subscriber, Douglas Co., Wis.—A made a verbal contract with B to buy ten acres of B's land, and B allowed A to go on the land and cut logs and build a shack of one room which cost less than $10. A lived on the land thirteen months, making fuel from the timber on it, and refused to clear the land, and violated three verbal agreements about payments and finally left the state of Wisconsin, but claims the right to sell the land and the shack. There were no papers made out between A and B. Has A any lawful right to the land or the shack?

Answer.—A has no lawful right to either the land or the shack. A verbal contract for the purchase of land is not binding or valid. Such a contract must be in writing to have any force or effect.

Some Mistakes in Hog Raising.

No Profit in Pursuing the Policy "in One Year and Out the Next"---By John Bower.

NOT all hog raisers are good hog caretakers. To be a good breeder of hogs means work. It means study. It takes the best that is in one to succeed. One cannot be a "slacker" and get anywhere. There may be "easy money" in pork production, but there is no easy way to get results. There are too many mistakes; too many costly blunders. Let us look at some of them: Lack of persistence; too many "in" and "outers;" too small litters; improper care and handling of the brood sow; feeding without study of the needs of the animal; keeping too many or too few hogs; improper housing; unsanitary housing; failure to provide suitable pasture; use of a poor sire and immature breeding stock; breed shifting; failure to recognize value of hog manure; poor feed arrangements; not enough time given to study of markets; failure to recognize breed and blood.

Is that all, you ask? No, not all, but it is enough. Let us look at the first one. Who ever heard tell of anyone making money in the hog business, or any other for that matter, who was "in" one year and "out" the next? When prices drop they sell out their good brood sows. There is no money in hogs, they declare. Then when prices advance they buy, at enhanced prices, other men's brood sows. And they are sure they are going to make a barrel of money in hogs. They buy plenty. Such men are usually long on finished pork when low prices prevail and short when prices rule high. To succeed, one must stay with the game year in and year out. High and low prices, cholera or no cholera, stay with the business. There is good money in pork production.

It has been said the hog is a mortgage lifter. That is all right as far as it goes. Let us see. It costs about $20 a year to keep a brood sow. If she has two of a litter each little pig costs $10. That is a pretty big mortgage for the little fellow to lift. Even if there are four in a litter each little pig starts with a mortgage of $5. He never will lift that in the world. That is why the successful pork producer insists on larger litters and in many districts two litters a year. There is a reason. The large litter is one of the most important factors in cheapening the cost of pork production.

Not only must the litters be of fair size but they must start off strong. The parents should be in vigorous, healthy condition when bred and the sow given plenty of exercise and the right kind of feed. There is a very close relationship between the character of the feed fed and the vigor, size and healthfulness of the young. I am told one hog raiser during a season of low prices for potatoes fed liberally this product to the sows. The resultant litters lacked size, lacked vigor and even lacked hair. Too much starch. The sow cannot make something from nothing. She needs protein and bone—and even hair-producing material if she is to make a litter of vigorous, well-nourished offspring. When the litter does come don't crowd the sow with a lot of milk-making material. For forty-eight hours very little feed should be given. She should be on full feed at the end of a week and at the end of a month needs outside assistance in the form of skim milk for her brood.

The same study of the needs of the sow can be applied to the growing young animal. Bone and muscle-building materials are needed. Get growth and get it quickly and cheaply. Corn won't do it. Not alone, at any rate. Corn and tankage! Corn and clover! Corn and alfalfa! Corn and skim milk! Corn and buttermilk! If the self-feeder fills the bill use it, but be sure to give the pigs a chance. Get growth. Get bone. Get size. The breeder who fails here fails as a breeder. Not only get it, but get it cheaply.

And here is where pasture comes in. The average hog pasture is a joke. About forty hogs are turned into a two-acre pasture and when they have eaten what little is above ground they proceed to eat everything below ground. You then use language not fit for church. Better ring them, of course. But, better still, give them more acreage. Give them ten acres of good clover pasture and they will make a gain of twenty-five to thirty pounds an acre and you can cut a good crop of hay besides. If you have not a clover field handy, winter rye, peas and oats, barley, alfalfa or rape will suit his majesty very well. If you have not any sow some. You cannot afford to neglect pasture, plenty of pasture, if you want to lessen the cost of production. If it is a fall litter and winter growth is the end in view, second crop clover or well-cured alfalfa will turn the trick and change loss to profit. But don't forget corn.

In no case should one keep more pigs than can be properly fed and cared for. Well lighted, well bedded with clean, dry straw and built free from drafts, that is the kind of a house Mr. Hog wants. He is kind of particular. He doesn't like to creep out of a steaming manure pile when it is 20 degrees below zero. He is just ornery enough to contract pneumonia and contract it right, too. It is foolish to attempt to keep hogs under those conditions. Make conditions right and he will do right by you.

Space will not permit a discussion of all the points. Look them over. You will find food for thought. Take a pencil and paper and write out your mistakes. You may not have all those recorded above. You may have some others. Choose a breed and stick to it. Breed from mature stock. Save labor by "hogging" down corn. Study the markets, but, above all, do not fail to recognize blood as found in the stock of a good breeder. Breed counts. Blood talks. Care, study, all help to make the successful feeder and breeder of the cheap meat producer, the hog.

Bulletins and maps descriptive of the soils of Waushara, La Crosse, Kewaunee and Juneau counties, the Bayfield area, and fifteen counties in northwestern Wisconsin have been issued by the division of soils of the Wisconsin geological survey. Bulletins covering the soils of Columbia and Jefferson counties are now in press. A survey of the northeastern part of the state has also been made, a report of which is now being published. A report and map are in course of preparation covering Vilas Oneida, Price and Iron counties, and the field work has been completed in Marathon, Lincoln, Taylor, Clary, Wood and Portage counties.

Tests Reveal The Danger In Planting 1915 Seed Corn

CORN experts say that only 5% of the 1915 Corn crop is fit for seed. If you use weak, sickly 1915 Corn, the small amount of seed which grows will make puny sprouts that will soon die if exposed to unfavorable spring weather. Even if it should have the advantage of warmth and sunshine so as to survive, the growth would be slow and there would be slight chance of its ripening.

The illustrations above show the comparative strength of the germs of both 1914 and 1915 Seed Corn. The 1915 Corn in the box at the left shows weak sprouts and few side or lateral roots.

Contrast with these, the strong, vigorous lateral roots and sprouts of the 1914 Seed Corn which we are selling. Its germination is about 90%. This Minnesota Grown, 1914 Seed Corn is early maturing, sound and dry. It was selected from the short kerneled, earlier types of Corn. This is practically the only Seed Corn which is safe for planting this spring in Minnesota, Northern Wisconsin and North Dakota. We recommend this also for South Dakota and Southern Wisconsin.

Dealers Everywhere Sell NORTHRUP, KING & CO.'S SEEDS

You can buy this tested Seed Corn from your dealer. If he has not ordered from us, urge him to get it for you. Every bag we ship bears a tag on which appears our name, germination test, and the county in which the seed was grown.

Our Catalogue Tells the Seed Corn Story

It gives the reasons for the failure of the 1915 Seed Corn crop and is interesting to every one who plants Corn or any other crop. A practical planting guide for field and garden.

Fruits and Garden

The Codling Moth.

The codling moth or apple worm causes the greatest loss to the apple crop in the United States, and particularly in Wisconsin it may be considered our greatest apple pest at this time. This insect was introduced from Europe many years ago and is now found in practically all of the apple-growing regions of the country as well as many foreign countries. Its ravages and damage to fruits can be readily controlled by spraying at the proper time with arsenical poisons as described below.

Before treatment it is well to know the main points in the life history of this insect which produces two broods during the year—two broods of the apple worm being produced each summer.

The insect overwinters as a larva in silken cocoons spun underneath loose pieces of bark on the tree or in cracks of boards, boxes or barrels or rubbish wherever lodgment can be found in the fall. Early in the spring the larva in a cocoon changes to a chrysalis and emerges as a tiny moth soon after the blooming period of the apples.

Eggs are laid on the young apples and leaves at this time from which hatch tiny larvae or "worms" which burrow into the apple and work to the core causing the young apple to drop from the tree in a short time. The well-known "June drop" is generally the result of this attack. When the larva is mature it spins a cocoon from which hatches an adult moth about the last week of July.

Eggs are laid about the last week of July or the 1st of August and another life cycle as above is passed, except that in Wisconsin the mature larvae spin up in favorable locations and remain so over winter, as described above.

A spray of arsenate of lead, one to one and a half pounds of powdered (three pounds of paste) in each fifty gallons of water, should be applied just after the petals have fallen from the trees. A second application of the same strength should be made about two weeks later. No further spraying will then be necessary until the last week of July or the first few days of August, at which time a second brood will be developing.

These three sprayings may be combined with lime-sulphur solution, using one and one-half gallons of the commercial material to each fifty gallons of water. This lime-sulphur solution (or Bordeaux mixture) is, of course, used to control the "apple scab."

These sprayings will also control all other foliage-eating caterpillars so that additional applications of poison will not be necessary. These treatments are cheap and easily applied with the aid of proper spraying apparatus, such as a barrel pump or power outfit.

Any questions concerning insect pests and their control are gladly answered by J. G. Sanders, state entomologist, state capitol, Madison, Wisconsin.

Growers Must Spray.

Nothing would do more to improve Wisconsin's reputation as a fruit-producing state than for everyone who owns an orchard to spend just a little time and money this year in spraying his trees.

This prediction is made by horticulturists at the agricultural experiment station. They are of the opinion that Wisconsin will have a smaller apple crop this season than last and that there will a greater chance to place surplus fruit upon the market but are convinced that the fruit which will be produced will neither be suitable for marketing or for home use unless the grower sprays. Growers who take proper care of their fruit usually find that even in seasons of abundant supply, as in the case of last year, they are able to get remunerative prices for it, while their neighbors who do not take care of it, cannot sell their fruit.

According to the state authorities, the adoption of the following spraying program should enable every grower in the state to produce fruit which will be satisfactory for home use and the surplus of which would find a ready sale upon the market.

If trees are infested with scale insects, spray with lime sulphur shortly before growth starts. Use five gallons commercial lime sulphur in 40-45 gallons water.

If plant lice were prevalent the past season, spray with 40 per cent nicotine sulphate one part to 700 parts of water (one pint to eighty-seven and one-half gallons of water) to which should be added three pounds of soap solution. Apply just as buds begin to show green.

The regular seasonal applications are as follows:

Spray with fungicide and arsenate of lead when blossoms show pink. Add nicotine sulphate as above, but without the soap, if plant lice are present.

Spray again with the same materials within three to five days after most of the petals have fallen, then about ten days to two weeks later, and on later varieties about July 20th to 30th, depending on section of state and whether season is relatively early or late.

If the weather is moist and warm, make an application between the last early and the July sprayings.

The fungicide used may be either commercial lime sulphur, five to six quarts in fifty gallons of water, or 4-4-50 Bordeaux mixture, which consists of four pounds of copper sulphate, four of lime and fifty gallons of water. This year when the price of copper sulphate is so high it would probably be advisable to use a 3-3-50 Bordeaux.

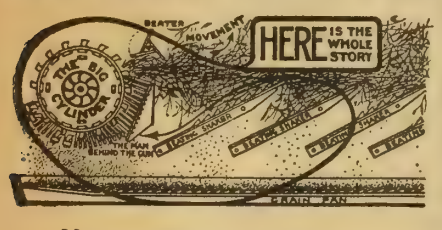
Arsenate of lead is most conveniently used in the powdered form at the rate of one and one-half pounds to fifty gallons of water.

The spraying will vary somewhat with the pests present, but this program will be applicable in most cases.

Substitute For Paris Green

On account of the rise in price of Paris green, which is now selling at 50 cents a pound even in large quantities, an effort has been made by potato growers and orchardists to find a substitute. A. F. Ruggles, of the Minnesota station, says that arsenate of lead is a better insecticide than Paris green and that it has not advanced in price. He is authority for the statement that arsenate of lead in powdered form may be obtained for about 25 cents per pound and one and one-half pounds of the powder is used in making fifty gallons of spray mixture. In experiments at the Minnesota station it has been found that arsenate of lead is even better than Paris green as a remedy for potato bugs and all orchard insects. The orchardist should get his spray materials as early as possible this year, as it is hard to tell when arsenate of lead may begin to go skyward in price, following the Paris green.

WAR ON WASTE
WITH THE
Man Behind the Gun



You grow your grain for profit.
Wasteful threshing means that both grain and profit are being thrown away.

Buy or Hire a Red River Special

To do your threshing this year, and get all of the grain that you raise and all of the profit that it will bring.

Everything that will do fast, clean and perfect threshing is to be found in this machine: the Big Cylinder, the Man Behind the Gun, the Beating Shakers, all are there to take all of the grain from the straw.

The patented features of a Nichols-Shepard Red River Special will alone thresh and save more grain than other machines can secure with their entire mechanism.

Guaranteed Seed Corn

WE recently sent average identical sample of our Northern Iowa latitude grown and Central Minnesota (Redwood Co.) grown seed corn to the foremost agricultural college of this country and have just received their official report, as follows:

Nor. Iowa lat. grown.		Cen. Minn. (Redwood Co.) grown.	
Wimple's Yellow Dent	97%	Northwestern Dent	96%
Iowa Gold Mine	96%	Wis. No. 7 or Silver King	92%
Goddard's Sil. King	94%	Minnesota King	96%
Reid's Yellow Dent	97%	Minn. Ea. Yel. Dent	92%
Minnesota No. 13	90%	Minnesota No. 13	88%
		Minnesota Early White Dent	73%

The above tests prove that our stocks of genuine NORTHERN GROWN Seed Corn are the highest qualities you can buy—regardless of price.

We Give You a Sworn Statement as to Where Our Seeds are Grown

We do not handle any dent corn from either central or southern Iowa, Nebraska, Kansas, Missouri or Illinois, as such seed, although of good germination, cannot ripen and mature in the north. Look at your map. **Don't buy seed corn that is grown south of you.**

We GUARANTEE every bushel of Seed Corn we ship to be exactly as represented in every particular or money refunded.

Get our FREE catalog at once and send your order promptly if you want any of the above lots.

BOX 50, DECORAH, IOWA

APPLETON Silo Filler

Actual records prove that Appleton Silo Fillers cost the least in service

per ton of silage put up or per year of life. Tremendously strong construction makes an Appleton practically proof against breakdown. Solid oak and steel frame, mortised, braced and bolted; impossible to pull out of line. Many exclusive power and labor saving features, such as independent belt driven blower allowing speed to be adjusted for minimum use of power for any height silo; frictionless feed table running on chilled iron rollers; knives spiraled to give clean shearing cut, requiring least use of power. (10 lengths of cut, 5-16 to 2½ inches.) Lowdown cut-under frame, easy to handle. Both feed rolls and table controlled by single lever. Positive self-working safety device.

Guaranteed to do more and better work with less power than any other silo filler.

Two Books Free: One on silo building and silage crops; the other a complete catalog of Appleton Silo Fillers in four sizes for 4 h. p. gasoline engines and up. Write

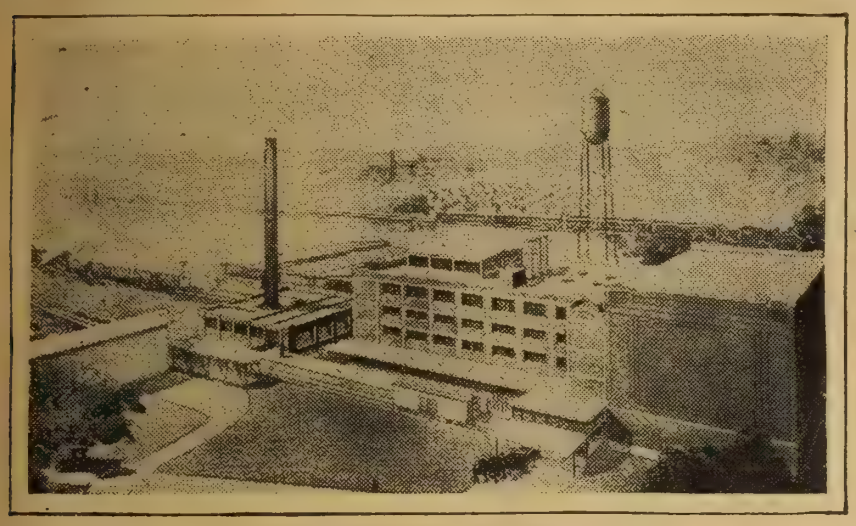
In and Around Wisconsin

County Orders of the Experiment Association Elect Officers For Coming Year---Other Interesting Items.

Peter Tollefson, of Stanton, St. Croix county, reports that he has a Short-horn cow, seventeen years old, who has twenty calves to her credit. She recently dropped twin calves which performance has become a habit with her.

Farmers and dairymen in the town of Empire, Fond du Lac county, have started a movement to form a cow-testing association and F. H. Scribner, Math Michels and H. C. Searles addressed a recent meeting in the town for this purpose.

Edwards Wittwer & Bros., of Monroe, Green county, have let the contract for a cold storage building which



PROPOSED FARMERS' PACKING PLANT.
This plant is being erected at Madison. Photo taken from architect's drawing.

will be completed about August 1st. It will be used exclusively for storing cheese and will be three stories high and of fireproof construction.

The Barron county order of the experiment association met recently at Barron and elected William Bartlett, of Barron as president; W. H. Clark, of Rice Lake, vice president; R. L. Cuff, of Barron, secretary and treasurer. Mr. R. A. Moore addressed the meeting and emphasized the need of growing pure-bred grains.

The Wood county order of the experiment association has elected these officers for the coming year: President, A. P. Bean; vice president, J. F. Schmidt; secretary and treasurer, W. W. Clark. The county farm management winners were also announced at the meeting. Herman Bassuener won first; Filliam Ehlert, second, and Mrs. G. H. Tenpas, third.

The Douglas county board of supervisors, which appropriated $10,000 some time ago for the county fair has just made available for immediate work $2,500 of this amount. The remainder will be turned over to the fair association about June 1st. This money will be used in equipping the fair grounds and making improvements that will make this one of the best fairs in Upper Wisconsin.

Another organization to boost better agriculture has been formed in Rock county and is known as the Rock County Farm Improvement Association. It will have charge of the farm management work in the counties and other activities which will improve agricultural conditions. The growing of alfalfa is being urged at the present time and it is hoped to materially increase the acreage this year.

The town of Geneva, in Walworth county, at the spring election voted $2,800 for the purpose of building a new town hall or rather a community house. The project was backed by the Worthwhile Farmers' Club, which followed the precedent set by other farmers' clubs in that county in inducing the towns to vote money for town halls which can be used as places in which the community associations can gather. The club agreed to stand any expense over $2,800 and the hall, which will be located at Como, will be first class in every respect. H. E. Brooks went to the expense of getting the plans which were submitted to the voters for approval.

Juneau county cheesemakers, farmers and others interested in the factories of the county, gathered recently at Juneau and heard E. L. Aderhold explain the workings of the new license law and see a demonstration of the Babcock test by Prof. J. L. Sammis, of Madison.

John M. Taylor, of Walworth county, has some White Plume chickens which he thinks have a splendid egg record, considering that they have received only ordinary care. The layers are all July pullets and on February 1st the first one began to lay; on the 2d the second one began and on the 8th the third began to lay. During February these three laid fifty-six eggs and in the forty days after the first one began to lay they laid seventy-nine eggs. Mr. Taylor says that he did not wish to force them, as he desired the eggs for hatching.

The Dunn County Agricultural Society is now organized with $10,000 capital stock consisting of 1,000 shares at $10 each. The stock is to be offered for sale.

George A. Phillipi, sheep breeder of Bear Creek, Shawano county, recently brought to his Wisconsin farm a pair of Persian Flat-tail sheep with which he will do experimental breeding.

Glenn M. Householder, who was recently appointed county representative of Rusk county, has taken up his new duties and will have his headquarters and offices in the court house at Ladysmith.

The directors of the Rock county fair at Janesville are planning extensive improvements for the 1916 fair and an addition to the cattle barns will probably be built. The cattle entries last year were very large and tents had to be used for about half the stock exhibited and indications point to a larger entry list this year.

All except $500 of the originally authorized capital stock of $250,000 for the Inter-County Co-operative Packing Plant at New Richmond has now been subscribed. Farmers in the St. Croix valley and adjacent counties are interested in the project and the promoters have announced that only five $100 shares remain to be sold.

The Polk County Order of the Wisconsin Experiment Association elected V. A. Miller, of Osceola, as president for the coming year at its recent annual meeting. Joseph Clark, of Dresser Junction, was elected vice president and J. S. Klinka, county agricultural representative, secretary. The secretary's report showed that the members have enjoyed a good business in seed grains this spring and that they have on hand about 5,000 bushels. During the coming season it is planned to extend the work into every section of the county and more farmers than ever before have agreed to raise pure-bred grains and certified potatoes.

Value of Farm Lands.

The value of farm lands of the United States, without improvements, is estimated at $45.55 per acre, as compared with $40.85 a year ago, $40.31 two years ago, $38.10 three years ago and $36.23 four years ago. The census reported the value of farm lands in 1910 as $32.40, and in 1900 as $15.57 per acre.

In recent years the value of farm lands has been increasing at the rate of about 5 per cent a year, or approximately $2 per acre per year. The exceptional increase of the past year may be explained partly by the reaction in the southern cotton states following a temporary depression last year, and partly by the stimulus given by the war to prices, particularly of grain.

Increases have been general throughout the United States, the only noteworthy exceptions being orchard lands and some irrigated lands in the northwest, which apparently had been overvalued before.

The percentage increases in value of farm lands in the past year by sections of the United States are: North Atlantic States, 10 per cent; eastern part of North Central States, 9 per cent; western part of North Central States, 12 per cent; South Atlantic States, 19 per cent; South Central States, 11 per cent; Far Western States, 11 per cent; entire United States, 11.5 per cent.

The percentage increases in farm land values in four years, that is since 1912, are: North Atlantic States, 17 per cent; eastern part of North Central States, 20 per cent; western part of North Central States, 28 per cent; South Atlantic States, 23 per cent; South Central States, 25 per cent; Far Western States, 34 per cent; entire United States, 25.7 per cent.

These estimates are based upon reports from crop reporters of the Bureau of Crop Estimates. Details by states of prices of plow lands and of all farm lands with improvements and without improvements, will appear in the April Monthly Crop Report.

FARM MECHANICS

Auto, Farm Engine and Farm Machinery Ailments diagnosed and remedies suggested in this department

QUESTIONS AND ANSWERS.

Windmill Power.

Would it be possible to run a feed grinder by a windmill? The tower is forty feet high with an eight-foot wheel.

Answer.—We do not think it practical to run a feed grinder with an eight-foot windmill.

Capacity of Dynamo.

I have a dynamo that generates eight volts and ten amperes at 2,500 R. P. M. How many six-volt, fifteen-candle-power lights will it supply? What size dynamo is required for a moving picture machine?

Answer.—Your generator should supply three fifteen-candle-power lights. The size of generator required depends upon the moving picture machine. The agent can give you this information.

A Cement Mixer.

Please publish plans for a homemade cement mixer, to be run by an engine. I intend to build a cement tank in the spring, and I would like to know if any of the readers ever have heard of putting piers under the tank instead of a deep foundation. The piers to be about ten inches across and extend below the frost line; about three on a side of a tank eight feet wide and sixteen feet long. The local cement man says this is practical. Please give your opinion.

Answer.—Figure 1 shows the side view and Figure 2 the top view of a homemade cement mixer. It consists of a strong barrel mounted on an axle shaft, supported by a wooden framework. The barrel is fastened to the

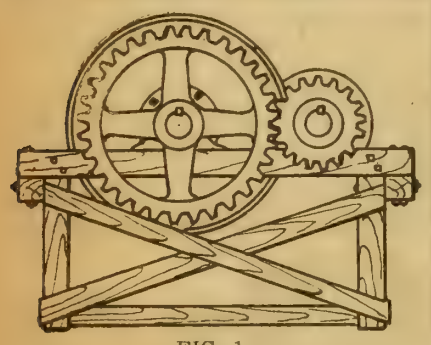


FIG. 1.

shaft by cast iron hubs or flanges bolted to the barrel heads and keyed to the axle shaft. A gear nearly as large as the barrel is keyed to the shaft. The gear is driven by a small pinion on a belt pulley shaft. At the other end of the belt pulley shaft is a tight-and-loose pulley. A solid pulley may be used if the engine has a clutch. The cement is put into the barrel through a trap door on the side. The door may be made of a piece of boiler plate and fastened by a hasp and two strong staples. The edges of the opening in the barrel should be strongly bound with strap iron. Diagonal cleats on the inside of the barrel aid the mixing. The cleats should run alternately right and left. The boxing for the axle and shaft, also the shafting, may be obtained from a dealer in machinery or hardware. Gear the out-

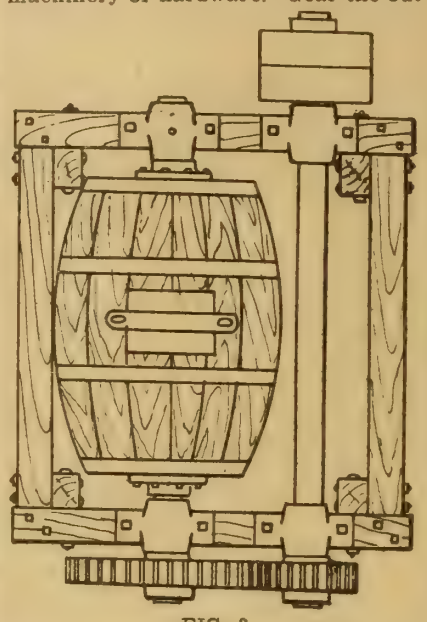

FIG. 2.

fit so that the barrel revolves about thirty times per minute.

The piers should be all right to support the tank if they rest on solid ground. We would advise you to make your piers one foot square and place them not over four feet apart. The cement should be re-enforced with iron rods or wire.

Size of Motor for Pumping.

How large a motor would be required to operate a compression tank pump? The pump has a capacity of 700 gallons per hour. The water is pumped to fifty pounds pressure. The pump is equipped with a twelve-inch pulley that runs 125 R. P. M. Will it be necessary to install a line shaft or will it operate direct from the motor?

Answer.—A one-half horse power motor would be suitable for the above pump under ordinary conditions. If the water is lifted or forced to a considerable height and the pump used continuously a somewhat larger motor might be advisable. No line shaft would be required unless you wish to use the motor to run other machinery.

Distilling Water.

I would like to know how to distill water. Is rain water all right to use in storage batteries? How is the water put into the storage cells?

Answer.—Apparatus for distilling water in small quantities may be made from a copper teakettle having all the openings stopped and a piece of quarter-inch copper tubing soldered into the top. The tubing should be about four feet long and bent to form a coil. When in use immerse the coil in cold water to condense the steam.

Clear, fresh rain water may be used in mixing the electrolyte of a storage battery. It is best to test the electrolyte with a hydrometer. It should test about 1.3 when the battery is fully charged. If it tests more than this water may be added to replace the electrolyte that has evaporated. To fill the cells unscrew the vent hole plugs and pour the electrolyte in, using a glass funnel.

Steam Engine Horse Power.

What is the correct method of estimating the horse power of a steam engine? Should a boiler be left full or empty when not in use?

Answer.—The horse power of any engine is equal to

$$\frac{PLAN}{33000}$$

in which P=average pressure in pounds per square inch on the piston, L=length of stroke in feet, A= piston head area in square inches and N= the number of power strokes. For a steam engine, P, the average pressure, is best obtained from an indicator card. It may be roughly estimated as 60 per cent of the boiler pressure. L is the cross head travel in feet. To find A multiply the diameter of the piston by itself and multiply the result by .7854. For a steam engine N =twice the R. P. M. Multiplying the average pressure by the length of stroke by the piston area and by twice the number of revolutions per minute and dividing by 33000 gives the steam engine horse power.

When standing idle the boiler should be drained and the handhole covers removed, so that the air can get at the tubes. The air tends to loosen the scale. Before closing the hand holes, wash the boiler out and remove the scale that has fallen to the bottom.

AN INCREASE OF 100%
IN THE SALE OF
Champion
"TOLEDO MADE FOR THE WHOLE WORLD'S TRADE"
Dependable Spark Plugs

WE will make and sell this year fourteen million Champion Dependable Spark Plugs.

This is twice as many plugs as we produced last year, when our sales greatly exceeded those of all others manufacturers of spark Plugs combined.

As our production has increased, so has the uniformity and dependability of our product increased.

And now, after exhaustive competitive tests, four out of five of this year's record output of new cars will be equipped with Champions—over a million new cars.

There is a Champion especially designed to dependably serve your particular motor. See that your dealer furnishes Champions when you replace the plugs in your car. He knows which one will serve it best.

Champion Spark Plug Co. 507 Avondale Ave., Toledo, O.

IT'S the heavy cast-iron pistons in a motor that are responsible for so much of the vibration. That vibration is what causes the constant rattle and riding discomfort—many of the repair bills.
Cut down the piston weight of your Ford two-thirds by installing

LYNITE
ALUMINUM
PISTONS

and you'll get rid of vibration in proportion.
That's exactly what has been done in most of the new 1916 high-class cars. They are using LYNITE Aluminum Pistons.
Nothing increases the mechanical efficiency of the Ford motor like LYNITE Pistons—gives such extra snap, speed, power—means such quiet, smooth-running, lasting service. These pistons are equipped with

McQUAY-NORRIS LEAK-PROOF PISTON RINGS

—the rings that improve compression, save fuel and oil, reduce carbon.

Manufactured by
McQuay-Norris Manufacturing Co.

POULTRY DEPARTMENT

THIS department is edited by a competent poultryman, who will be pleased to answer questions concerning disease, poultry management, etc., when they can be answered through the department. Questions will not, however, as a rule, be answered by mail, and stamps need not, therefore, be inclosed with inquiries. Address all letters relating to poultry topics to this office.

Money in Turkeys.

For those who are favorably situated for raising turkeys, a more profitable side line can hardly be found. Given plenty of range where the turkeys can find grasshoppers and other insects, green vegetation, the seeds of weeds and grasses, waste grain, acorns and nuts of various kinds, the cost of raising them is very small and the profits large. Grain and stock farms are particularly well adapted to turkey raising, and it is on such farms that most of the turkeys are found. Little has ever been done in the way of raising turkeys in confinement, and where it has been tried the results have been discouraging. Plenty of range is essential to success in turkey raising.

In selecting turkeys for breeding the most important factors to be considered are vigor, size, shape, bone, early maturity and color of plumage. The body should be deep and wide, the back broad, and the breast round and full. The head should be of good size and of a clean, healthy appearance. A strong, well-made skeleton is shown by thick, sturdy shanks and straight, strong toes. It should be the aim of every turkey raiser to have a flock of pure-bred turkeys, even though they are sold at market prices. The male at the head of the flock should by all means be a pure bred of the best type obtainable. The male is one-half the entire flock, and by continually selecting the best females of a similar type and mating these with a pure-bred male one can soon have a flock of uniformly large, early-maturing, strong-boned, long and deep-bodied turkeys of the same color.

Fifteen turkey hens can safely be mated to a vigorous tom. If twenty-five or thirty hens are kept, two toms should not be allowed to run with them at the same time, but one should be confined one day and the other the next. When two toms are allowed to run together during the mating season they fight badly, and the stronger does practically all of the mating.

Turkey hens are wont to "steal" their nests in hidden places, such as a patch of weeds, tall grass or thick brush, and often wander a half mile or more from home before they find locations that suit them. To find these stolen nests often proves to be a long and tedious task, the usual method being to follow each turkey hen as she separates from the flock and starts toward her nest, care being taken that she does not know she is being followed. A much easier and quicker method than this is to confine the hens early some morning soon after they have come down from roost and let them out late in the afternoon. Those that are laying will then head for their nests in order to lay the eggs they have been holding.

If many turkeys are kept the use of a breeding pen will be found a great convenience. This pen should cover a sufficient area to allow the turkeys some exercise, an acre for fifteen birds being none too large. A hog-tight wire fence three feet high will hold most turkeys, and if any persist in flying out, the flight feathers of one wing should be clipped. Nests should be scattered about the pen, those which turkey hens take to most readily being barrels turned on their sides and nests shaped in them with straw.

Turkey hens, chicken hens and incubators are commonly used to incubate turkey eggs. During the early part of the laying season it often happens that one has on hand a number of eggs that should be incubated before any of the turkey hens are through laying their first litter and become "broody." In such case and also when it is desired that the turkey hens lay more than one litter, some of the eggs have to be incubated under chicken hens or in an incubator. About a week before the poults are due to hatch, turkey hens enough should be allowed to sit to take all the poults hatched. They can be given a few eggs from the incubator or from under the chicken hens and allowed to hatch the poults themselves, or at night a newly-hatched poult can be slipped under each turkey hen that is to be given a brood of poults, and by morning she will be glad to take them.

Lice are a great annoyance to sitting hens, and are one of the worst enemies of young poults. To prevent their getting a foothold, dust the hen thoroughly with some good lice powder before she is placed on the nest and once a week thereafter while she is sitting. The nesting material should be kept clean, and if the eggs become dirty they should be washed with lukewarm water.

If the weather is warm and dry no shelter is required, as the poults do better in the open. Should it be rainy, however, they need to be protected, for nothing is more injurious than for them to become wet and chilled. The most satisfactory plan is to confine the mother turkey hen to a coop and allow the poults to run in and out whenever the rain does not prevent. This coop should be placed in a field where they can run out and find grasshoppers, green vegetation and other feed. The coop should be moved to fresh ground every day. Improper feeding and close confinement, has been the cause of many failures in turkey raising. Given free range on the average farm, the poults can easily pick up their own living, and one light feed a day for the purpose of inducing them to come in at night is sufficient. If the mother hen is confined to a coop and the poults allowed to run in and out three times a day is often enough to feed and very little should be given at a time. The poults should always be ready to eat; if given all they will clean up several times a day, indigestion will be the result. If there is little or no feed outside the coop for the poults to pick up, then they should be fed about five times a day, feeding only a small quantity at a time. A good feed for the first few days is stale bread soaked in milk and squeezed dry. Corn bread crumbs and clabbered milk of cottage cheese is also quite often fed and with excellent results. Green feed and grit should be on hand at all times. As the polts grow older the ration should gradually be changed to grain.

A PRIZE ORPINGTON.

This White Orpington cockerel won first prize at the Greater Chicago Show, 1916. This cockerel was bred and is owned by Mrs. Louis Montague, Ottumwa, Iowa.

GET MY PRICE

WAIT! Get my 1916 price! Don't buy an engine of any make or kind or price until you first get my low 1916 prices and easy buying plans, including easy terms. I build these Masterpiece engines in my great chain of factories and sell them direct to farm and shop with only one small profit added to actual cost. My New 1916, 250-Page Book illustrates and describes all sizes from 1 3-4 H. P. light work engines to 16 H. P. moguls for biggest, toughest, heaviest jobs. All Galloway Masterpiece engines are large bore, long stroke, heavy weight and low speeded. Built for lifetime service and satisfaction.

1916 FEATURES Include valves in the head, (worth $15 alone, but costs nothing extra), extra large cooling surfaces, perfected oiling system, economy carburet or (a fuel and money saver, worth $10 more—costs nothing extra on the Galloway), built-in magneto and Hercules water-cooled cylinder head, an arch of strength, mechanically perfect in design, (worth $25 extra, but costs you nothing!)

AK-6

LOOK! This new 1916, 250-page Book tells all about these features and many others that make Masterpiece engines superior engines and power kings in every field. Farmers' Institute For Indians.

Unusual Gathering in Wisconsin For the Purpose of Studying Better Agricultural Methods---By E. R. McIntyre.

TELL your friends among the white farmers that we are trying hard to improve our conditions and learn better agriculture. We know that the best things we possess are locked up in the soil of our reservation and we wish to thank you for bringing us the key to our own gold mine."

Thus Reginald Oshkosh, grandson of the famous Menominee chief after whom the "metropolis of Lake Winnebago" is named, responded to the efforts of the extension department, college of agriculture, which held a four-day farmers' course at the Keshena Indian Agency last month.

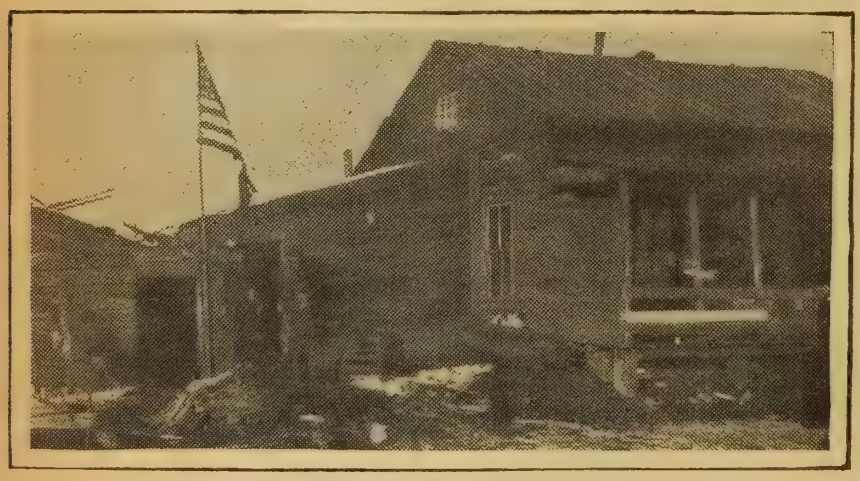
MENOMINEE INDIAN OF YESTERDAY AND TODAY.

These four days, packed full of excitement for the isolated inhabitants of the Menominee reservation in Shawano county, undoubtedly fulfilled a long-felt want and did much to promote friendship and understanding between the white "medicine men" from the state farm school at Madison and the reservation people. If it accomplished nothing more the four days' work has been successful.

Distrust and suspicion, so much a natural part of the Indian's outlook upon life in general ever since the discovery of the New World, still present themselves as obstacles to progressive agriculture on all Indian reservations. Menominee is no exception. When the first petitions were started for the holding of the farmers' course at Keshena many of the red brothers sullenly refused to sign, many of them thinking of former treaty rights which had gone a-glimmering in the flourish of a pen, or tribal funds embezzled through defraudulent schemes, cloaked in attractive form.

But now things are different here at least. The "wise ones" have come and gone, leaving behind vivid memories of plain, honest talk about taking care of cattle and horses, plowing and cultivating corn and potatoes, raising clover for hay and manuring crops—all delightfully blended with pretty colored pictures thrown upon a big white cloth, showing the best of the white man's live stock and farm crops, easily within the possibility of ambitious Indian husbandry if properly applied.

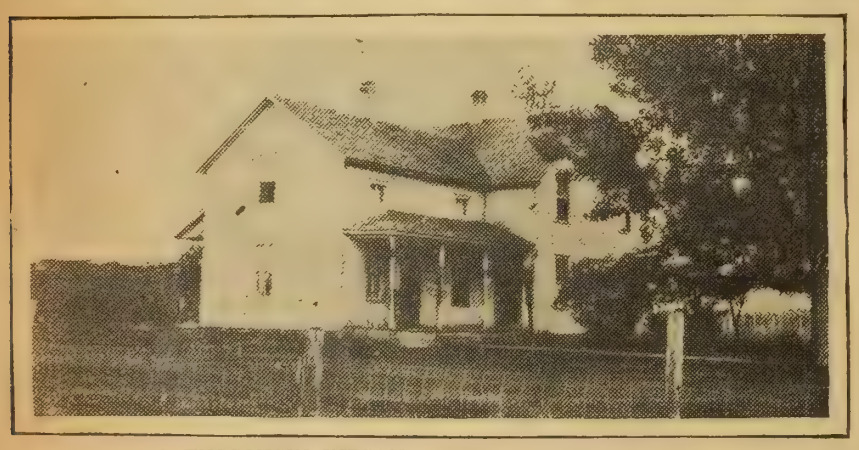
The men sent by the college of agriculture, J. R. Danks and J. F. Wojta, restricted their conversation to the simplest terms. Not once did "phosphorus," "legumes," "lactation," "nodules" or "acidity" pass their lips. It wouldn't do, and further, it proved good practice, this speaking strongly and plainly in Anglo-Saxon, so that every Indian farmer might understand.



OLD TYPE WISCONSIN INDIAN FARM HOME.

For 20 per cent of the audience an interpreter was needed, which made the work rather slow. Driving truths home by repetition was resorted to as the best means of doing good. As nearly all of the people could understand Menominee, hearing the same subjects twice, first in English and later by translation, served to emphasize the points involved.

Through the co-operation of the Indian service the meetings were held in the assembly hall of the government school, which was dismissed part of each day so that all students might attend the sessions. Board and room for the instructors from the college of agriculture, as well as transportation between the agency and Shawano, were supplied by the reservation officials, A. S. Nicholson, superintendent, and H. P. Marble, assistant superintendent.



A WISCONSIN INDIAN FARM HOME OF TODAY.

Further work on other Indian reservations in Wisconsin will undoubtedly result. Cato M. Sells, commissioner of Indian affairs, realizes that in scientific farming the Indian must seek independence.

Further work of this same kind may be carried out on other Indian reservations in Wisconsin next winter. Cato M. Sells, commissioner of Indian affairs, realizes that the Indian must seek his best livelihood in farming and mechanics. In these branches the Indian naturally excels, providing he can overcome an inborn tendency to take life easy.

It is not because the Menominee Indians are poor, as a tribe, that they need help. Their tribal treasury is well filled. On the contrary, there is need for teaching them to create new capital of their own by their own individual work, rather than to "odd-job it" intermittently and wait for pay day.

New houses of a modern type and large barns well equipped are fast going up on the village sites of other days, where the wigwam smoke curled aloft. And wonder of wonders! The new generation of young men look with disgust upon the old men sleeping near the fire while their aged wives split wood and carry water for the noon-day meal.

On the Menominee reservation there are 205 farmers, with 6,040 acres fenced and 3,012 acres under the plow. The total population of the reservation is 1,750, many of whom are engaged in lumbering at Neopit on the Indian timber lands, or working in the sawmill operated by the government there.

In 1915 the corn crop was a failure, 427 acres yielding about 1,800 bushels. Other records for the past season follow: Hay, 722 acres, 990 tons; oats, 422 acres, 10,814 bushels; wheat, twenty-two acres, 390 bushels; rye, sixty-two acres, 737 bushels; buckwheat, forty-five acres, 356 bushels; potatoes, 362 acres, 12,081 bushels.

About 360 ponies, 156 horses, 130 dairy cows, 520 hogs and a score of sheep constitute the domestic animal census. A number of pure-bred cattle are maintained at the government school at Keshena.

For a Good Corn Yield

International and C B & Q Planters

WHAT makes a good corn yield? Well, here is what a veteran corn grower says on this point: "Even planting of tested seed at the right depth, the same number of kernels in each hill, will do more to increase the corn crop on most any sort of soil than anything else that could be done."

For this—nothing is better than an **International** or **C B & Q** corn planter, machines that have been building up good names for themselves for years. They have a very simple variable drop, by means of which 2, 3 or 4 kernels can be planted in every hill. They also have a foot drop which enables the driver to space accurately the rows at the ends of the field. Another simple change, and they drill the seed in at distances ranging from 6 to 32½ inches, and they last because they are made of steel.

These are only a few of the features that make farmers like **International** and **C B & Q** corn planters. Ask the local dealers who handle these good planters to show you the points in detail, or write to us for full information.

DAIRY

New Richmond Completes Year of Test.

The New Richmond (St. Croix county) Cow-Testing Association has just finished a year of testing under the direction of Ivor Jones, tester. Mr. Jones has now taken up official testing and an effort is being made to recognize the New Richmond association.

The records of the association for the year show conclusively that it pays to keep good cows; that it pays to test them and that it pays to feed them well. The best three cows in the association made a profit of $313.23, while the poorest three made a profit of only $15.14. In other words, the men who milked these three poor cows received about an average of $5 for caring for each cow for 365 days. It would take thirty-nine like the poorest to make the profit earned by the best cow and 113 cows like the poorest to produce as much as the best three cows. These records for the year are:

POOR COWS.

Milk	Fat	Ret.	Feed	Profit
2,190	87.7	$28.09	$25.00	$ 3.09
2,678	109.6	34.25	25.00	9.25
2,790	95.0	30.54	27.18	2.76
7,658	292.3	$92.88	$77.78	$15.14

GOOD COWS.

Milk	Fat	Ret.	Feed	Profit
14,034	460.1	$168.89	$59.10	$109.79
11,166	426.2	143.73	41.98	101.75
10,512	410.6	143.90	42.21	101.69
35,721	1,296.9	$456.52	$143.29	$313.23

In speaking of the year's work Mr. Jones writes:

There were 386 cows that finished the year's record. There were eighty-three cows sold. Most of them brought good prices, and what brought the good prices was the records that they made.

Cows in the future are going to be sold, not so much by the individual, but by the records they make and the breeding back of them.

Other cows were sold, and they, too, were sold on their records. They were sold as canners because their records proved them to be unprofitable as milk and butter fat producers.

What the farmers are doing and ought to continue to do is to get good foundation stock.

Pure-bred sires are the most essential thing, and then breed up into good grades.

In this connection let us ask ourselves: What are we doing in Wisconsin and what is our aim? Our aim is to improve our live stock, to produce better dairy products, for more cleanliness all along the line. We want Wisconsin to be the leading dairy state of the Union. It can and should be. How are we going to accomplish this? First, by carefully weeding out all the unprofitable stock, and, second, by breeding into higher grade stock. How is this to be done? By the cow-testing association. More can be done along the line of extension work by the cow-testing associations than in any other way, first, by the definite records thus obtained; second, by better breeding and better feeding; third, by the power of example by the results obtained. Therefore, every good, loyal, progressive dairyman will encourage this testing association work in every way.

The testers cannot do the work alone. They need and must have the help and co-operation of the farmers. The farmers should show their interest in this work in every way, and by their interest they will encourage the testers and further the movement.

Cow-testing associations are going to be needed more and more, and as the years go by are going to be bigger factors in dairying success than ever before, and more are going to be organized in Wisconsin.

Many of the "boarders" now in existence that lower Wisconsin's butter fat average are going to the butcher's block. Of course, this is going to be hard in some cases, for not infrequently these "boarders" are pets of the old folks as well as the children, and they will not want her sold even if she is a "boarder." But why not transfer their affections and make that pet a good, profit-producing cow and thus encourage the children to take an interest in better feeding and better care?

The record shows that forty-four, or less than 12 per cent, of the cows that finished a year's work produced more than 300 pounds of butter fat. It is significant that the cow that produced the most fat and made the most profit consumed the most feed as indicated by the following report of the 300-pounders for the year:

Owner	Lbs. fat	Gross returns	Cost of feed	Profit
Wm. Wilen	388.2	$102.47	$31.71	$70.76

Marathon County Report.

The following is the report of the Stratford, Marathon county, Wisconsin, Cow-Testing Association for the month of February, 1916. Francis Woodward, official tester, writes us that the report is brief compared to many others which have been published in The Wisconsin Farmer, but he hopes to have more cows and more owners in the list next season:

Owner, name and breed	Age	When fresh	Pounds milk	Per cent fat	Pounds B. fat
Chrowser Bros.					
No. 3, R. H.	6	5-11-15	1579	3.5	55.3
No. 15, G. H.	4	24-11-15	1142	4.4	50.2

Garrett Hughes, President.
James L. Chrowser, Secretary.
Francis J. Woodward, Official Tester.

Winnebago Report.

The March report of the Winnebago Cow-Testing Association, furnished by Archibald House, tester, shows sixty-seven cows in the forty-pound list. Mr. House reports that the milk flow is not so heavy but that there is a gain in butter fat. Every member of this association has a silo and is getting splendid results from a balanced ration. The report follows:

Owner, name and breed	Age	When fresh	Pounds milk	Per cent fat	Pounds B. fat
Tenant Bros.					
Bertie Fisher, P. B. J.	10	12-11	852	5.0	42.6

Archibald R. House, Official Tester.

Holstein Breeders Meet.

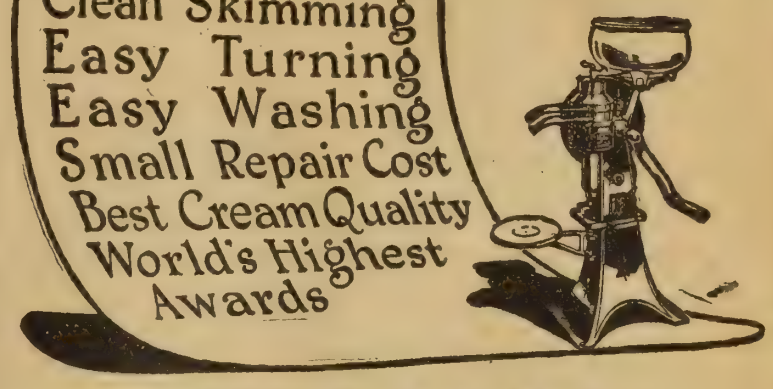
The Lake Superior Holstein Breeders' Association held its annual meeting at the city hall in Ashland, Thursday, April 6th. In order to further promote the Holstein breed in that locality $15 was appropriated to be used for prizes at the Ashland County Fair, for children under fourteen years of age residing within Ashland, Bayfield, Douglas, Sawyer or Iron counties, for the best essay on the Holstein cow. First prize, $2; second prize, $1.50; third and fourth prize, $1 each.

Being desirous for better cared for animals and as an inducement for such training, prizes will be offered at the Ashland County Fair to children under fourteen years of age showing the best groomed and cared for pure-bred Holstein calf under one year, first prize $2, second prize $1.50, third prize $1. Also for the best groomed and cared for grade Holstein calf under one year, $2, second prize $1.50, third prize $1.

A committee was appointed to secure six useful articles to be contributed by merchants, same to be arranged by the committee into two sets of prizes, first, second and third, and given at the fair as follows: To anyone showing the best groomed and cared for registered Holstein cow; to anyone showing the best groomed and cared for grade Holstein cow.

The Lake Superior Holstein Breeders' Association have worked out a plan to aid its members in buying and selling pure-bred and grade Holstein cattle. Each member having animals for sale lists them with the secretary, giving description and price, and those who are in the market for Holstein cattle file such information with the secretary.

This places the buyer and seller in touch with each other. The present



DE LAVAL

Stands On Its Record

FOR nearly forty years the De Laval Cream Separator has led in the cream separator field. It was the pioneer in 1878. It had a long start and has always held its lead. It has always led in every step of cream separator development and popularity, and more De Lavals are in use today than all other makes combined.

It has always been recognized as the closest skimming cream separator. That's the main reason why 98% of the world's creameries use it to the exclusion of all others.

Because of its cleaner skimming, ease of operation and wonderful durability, every De Laval user is a "booster" and the better its work is known in a neighborhood the more popular it becomes.

The better quality of cream it produces is attested by the fact that De Laval produced cream and butter have scored highest at every annual contest of the National Buttermakers' Association for twenty-four years and in every great representative contest for over thirty years. Last but not least, the De Laval was awarded the Grand Prize at the San Francisco Exposition in 1915 as at every other great exposition since its invention.

The creamerymen's choice can't be far wrong. The world's greatest dairymen and mechanical experts who act as judges at the great expositions can be depended upon to recognize real merit, and the fact that the De Laval is the choice of the majority of all cream separator buyers must mean a good deal to you. In your purchase of a cream separator can you afford to ignore these considerations?

Testing Associations and Milking Machines.

To the Editor:—I have been working hard to get a cow-testing association started in this county and I find the double unit milking machine with an undivided bucket quite a setback and it is keeping many farmers from entering their herds. Most of the dairymen having milking machines use the undivided bucket. It seems to me very foolish for any dairyman to install a double unit milking machine with a single bucket. If there are two cows standing side by side, one giving twelve pounds with a low test and the other giving twenty-five pounds with a high test, there is no way for these dairymen to know what their cows are doing. The cows are milked in the same bucket and thirty-seven pounds in a bucket seems a good lot, but the poor cow gets as much credit as the good cow.

I think this matter should be given more attention and I, for one, would like to see some good articles in your paper on milking machines. We are not using a milking machine, but we are weighing our milk morning and evening and it is surprising what a difference there is between two cows. Though there is a difference of only three or four pounds at a milking it makes quite a difference in a month's milk. Now I will be looking for articles in your paper on this subject.

Brown Co., Wis. B. H. Diny.

Dealing With Young Cows.

To the Editor:—Young cows do not always get the fair treatment they ought to have as members of the farm dairy. If they do not in the first few years of their lives prove good, or even extra-good cows, they are quite likely to be condemned and sent away, whereas if their owners had done just the fair thing by them and had a little more patience with them they would have developed into very choice cows.

It is held by a great many farmers that the fourth year of a heifer's life she is apt to be the poorest she ever will be. Just where that belief came from or what warrant there is for it is more than I ever knew. I have watched my own heifers and so far as I could see the fourth year was not less worthy than the third or the second. As a matter of fact, there ought to be steady progress year after year until the cow reaches the climax of her accomplishments. Then we may expect a deterioration.

For a moment let us see what is the right thing to do by a young cow, so that she may soon reach the very best possible attainments. In the first place, she ought to be where she is all the time free in mind—if a cow has a mind—and comfortable in body. By that I mean that she should not be bossed around or abused by other members of the herd or by anybody else. I do not know how it is, but a sense of comfort and freedom from fear are necessary to the best work on the part of a cow, young or old.

And then, we need to remember that the young cow is still growing. She needs, and must have, to reach her best in size as well as in milk-producing qualities, feed which will favor growth all round. From a calf up the dairy cow should be fed for dairy business. It is not best to feed so that there shall be an excess of fat. We should aim, rather, at a large body, good-sized bones and fine muscular development. That is why skim milk is better than full milk, especially after the first few weeks. Other feeds that tend in the same direction are wheat feed, wheat middlings, oats, some linseed meal and a liberal amount of hay as soon as the calf will take it.

This generous diet should be kept up right along as the young cow grows older. Fine, clean hay, timothy and clover mixed, good ensilage and some roots, with not too large rations of ground oats, wheat bran, middlings and some gluten, with corn meal if the flesh is not what it is desired that it should be.

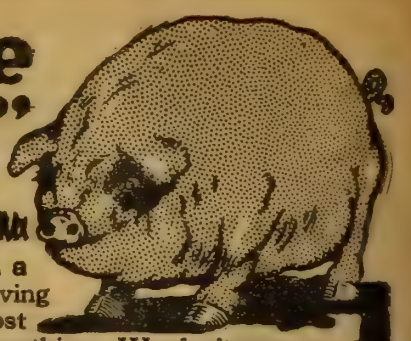
After the first calf is born is a critical time with the heifer. Then she needs extra-good care. Not only should the feed be such as to promote growth but to maintain the body against the drain of producing milk. At this period of her life corn meal may be fed in somewhat larger quantities than formerly. There are heifers that are inclined to "milk their flesh off," that is, to turn the feed given them more to milk than to flesh. Corn meal is particularly good where this is the case.

This plan of feeding, with good, kind care and stabling in winter, alternating with comfort out in the pasture in summer, will bring out the best there is in a cow. But we are not to expect her to be an old cow when she is only a young heifer. It takes time to develop any kind of a farm animal. A Reader.

Care of a Cow's Udder.

To the Editor:—It is a calamity to have anything happen to a cow's bag. Before now we have paid a great deal of attention to the breeding, feeding and growth of a certain cow, only to have it all upset and undone by some accident to the udder. After that happens little is to be done but to turn the cow off, for practically noth-

"What's Time To A Hog?"



That's what a fellow said when a stranger suggested a way of saving time in fattening his hogs. To most of us, our *own* time is worth something. We don't want to waste it doing unnecessary work—especially work we have to do 365 days in the year, like washing the cream separator bowl.

If you are using a separator that has any more discs than the Sanitary Milwaukee, you are wasting time—every day. The Sanitary Milwaukee has half as many discs as other separators.

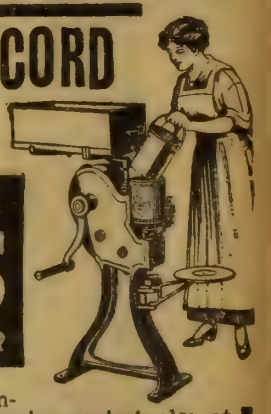
SANITARY Milwaukee CREAM SEPARATOR **discs are easier to wash, because grease and impurities do not stick to aluminum.**

They're as smooth as glass, no holes or raised bosses—as easy to wash as a coffee cup. You don't have to keep them in numbered rotation nor take them off the bowl core on a wire holder. You can really wash—*not merely rinse them.*

Before you buy your separator write for our new catalog and learn how the Sanitary Milwaukee will save you time and work.

MILWAUKEE SEPARATOR MFG. CO., 245 Madison St., *Milwaukee, Wis.*

HOLDS THE ONLY WORLD'S RECORD
For Closest Skimming



THE U. S. Cream Separator won in the most severe competitive contest ever held, covering a period of 30 days. At all World Expositions where there have been **working tests** the U. S. has won and received **Highest Award,** as has been proved by such Expositions as the Pan-American where the U. S. **won in the World's greatest skimming contest;** also at the Lewis & Clark Exposition where the U. S. demonstrated its superiority in **actual working tests,** and at the Alaska-Yukon Exposition where the U. S. **scored perfect** in skimming efficiency.

—THE— UNITED STATES CREAM SEPARATOR

Expositions, as in case of Panama-Pacific, which have not judged separators by actual working tests **render no proof whatever** of the merits of one machine over another.

Market the Milk

Raise your calves and get the bigger money to which you are entitled. But do not feed the calf whole milk, with butter fat worth $600 a ton.

You can sell all the mother cow's milk or butter and make your calf pay you a big profit on its feed, by raising it on

RAISE YOUR CALVES WITH BLATCHFORD'S CALF MEAL

Blatchford's Calf Meal
The Recognized Milk Equal

You get 100 gallons of rich milk feed from 100 pounds of Blatchford's Calf Meal, and it costs you only one-fourth as much. It will make your calf grow fast and well.

Blatchford's Calf Meal is composed of the elements the young calf needs in the most trying period of its life, is thoroughly steam cooked—prevents bowel troubles and other ills due to improper milk substitutes.

Blatchford's Pig Meal insures quick, sturdy growth of young pigs at weaning time, without setback or failing off.

Write us for our Free Book on "How to Raise Calves Cheaply and Successfully Without Milk"

Blatchford Calf Meal Factory
Madison St., Waukegan, Ill.

L. C. Beard, Bagerstown, Md. writes: I can say Blatchford's Calf Meal will pay anyone 100 Pct. that has calves to raise.

ing can be done for many injuries that come to this most delicate organ.

These difficulties arise from having the udder or one of the teats stepped on by a cow standing next to the sufferer; or they are due to injuries received while fighting; or in far too many cases some man who ought to know better strikes or kicks the cow in this exceedingly tender place and the trouble is one that cannot be overcome. I have known cows to be very seriously hurt in the bag by being hit with a stone thrown by the boy or man who was sent after the herd. Here, too, the injury is one that can rarely be remedied.

For this reason and others which need not be spoken of here it stands us in hand to see to it that every possible attention be given the udder of all cows. Many times men and boys do not realize what they are doing when they kick or strike the teats or upper part of the cow's bag. Whenever a new man comes into the barn to help about the milking he ought to be given clear instructions on this point, particularly if it develops that he is not inclined to be kind to animals. Young folks are especially apt to be thoughtless in this respect. They do not understand why the udder is not as tough as any other part of the body, when the fact is it is a great mass of tissue, with an intricate system of canals or ducts, all abundantly supplied with blood vessels, nerves and lymphatics. These may be easily obstructed or otherwise permanently injured. It is a thing to be startled at to see a single drop of blood coming from the udder of a cow, for it is a prophecy of the failure of the cow.

To my mind the box stall is the ideal way of stabling the cow. I hope to live to see the day when every cow will have her own roomy place to stay while in the barn. This will obviate many a serious injury of the udder from neighboring cows, as well as work to the comfort and advantage of the animal in many other ways.

There are some diseases, too, which affect the udder unfavorably. Some of these we can keep off, others it is not so easy to escape, but every possible pains ought to be taken to keep clear of mammitis, or garget and inflammation of the udder, as this trouble is sometimes called, as well as all other infections of the mammary gland. Even going too long without milking, so that the bag is terribly distended, is a bad thing and ought to be guarded against in all possible ways.

But the one great source of danger, that which comes from harsh and unkind treatment, never ought to be permitted in any dairy. We have hard things enough to bear that cannot be obviated without bringing any such thing on ourselves. E. L. Vincent.

Giving the Calf a Good Start.

To the Editor:—To raise a good dairy calf by hand is a particular job. In the first place let us notice the calf helping itself to its mother's milk. It takes a little at a time, but takes it often, thus allowing the juices of the stomach to become thoroughly mixed with the milk. Then when satisfied it lies down and remains quiet. But the poor calf that must eat out of a pail is expected, nay forced in some cases, to put its head in the pail and keep it there till the bottom is reached, and the quicker the better, so some of us think. Then many times it is hustled around and kept moving so it will forget to suck some other calf's ears. When I first started in to raise calves I did that very thing, never stopping to consider the result, but after some dismal failures I started in to do better, and with much more success.

The great danger in feeding calves, no matter how or what we feed, is in overfeeding. Don't do it. It is much better to err by feeding too little, as that can be easily remedied, but the calf that suffers a bad attack of scours will be a long time in catching up. As soon as the signs of scours are detected, however, which many times are noticeable by the odor before anything wrong would otherwise be noticed, the thing to do is to cut down on the feed sharply, both milk and grain. It is important, too, to see that the pen is clean and dry, as a damp, ill-smelling pen often causes trouble when all else is right. I have succeeded best when using the following method: The calf is allowed to stay with the cow until the ninth milking. The cow is milked at the regular time, all the milk being taken that the calf leaves. Many cows give much more milk than their calf can take. Also the cow, especially if she is young, becomes accustomed to having her udder handled and relieved and does not fret so much when the calf is taken away.

I once had a little experience that taught me a lot. In this case the calf, a big, strong, hearty youngster, took its milk all right, but insisted on having my fingers to help along, or else it balked right off and vented its displeasure by bunting everything in sight, myself included. Well, it was a good calf and I fussed with it till it was nearly three weeks old. Finally getting disgusted, I turned the milk into a trough that happened to be fastened to the floor of the pen and walked off. I was no sooner out of sight than that miserable calf began drinking like an old cow. It never got any more fingers, but never would it drink while I remained in sight.

But to go back to the feeding subject, the amount of milk should be very slowly increased till the calf is getting what it can manage well. It is not easy to adjust the amount of milk to the needs of a calf. Often one calf will not be getting enough, while another of the same age is receiving too much, even when one is taking as much as the other. So it is just as important to decrease as it is to increase the amount of milk fed. When the calf is two weeks old it will take a little grain in addition to the skim milk, ground oats and bran being good, and these, or whatever grain is used, must be fed sparingly till the calf is five weeks or more old. The amount can then be increased to a fair feed, the size of the feed even then depending on the ability of the calf to make good use of it, but in every case haste should be made slowly. If the grain is carefuly spread over the bottom of a small, shallow box the calf can then only get a little at a time and eat slowly, which is much better for it than if it gulped the feed down quickly. A little alfalfa or clover hay is good for the calf to nibble at between the regular feeds of milk and grain. Periods of regular feeding should be strictly adhered to. Cleanliness in all things and at all times is extremely important in the feeding and management of calves.

WESTERN SILO COMPANY
115 11th St., Des Moines, Iowa

Tom—You're not turning as fast as Dad does, Mary.
Mary—No Tom, but we'll get all the cream any way with this lovely new machine. Dad says

"It Skims Clean at Any Speed"

That's what this marvelous new invention actually does.

A fixed-feed separator may skim clean if in perfect order and turned at just the ***right speed.*** But every member of the family turns the crank at a ***different rate;*** no one can maintain an even speed ***all the time***—it isn't human nature. Every old type separator has an ***unchanging inflow*** of milk. That's why it loses cream when not turned at exactly the right speed.

THE NEW SHARPLES SUCTION-FEED

Separator gets all the cream because it automatically regulates the inflow exactly in proportion to the separating force—always just right for perfect skimming.

The Suction-feed Separator delivers smooth cream of ***even thickness*** that churns out more butter of choicest quality. If you sell cream you can ***guarantee uniform density.***

You can increase the capacity of the Suction-feed by simply turning faster, and get through quicker if in a hurry. The new Sharples is the only Separator that can be hastened. You can easily pour milk from a forty-quart can into the low supply can. It's the largest found on any separator—and it's only knee-high.

The women folks prefer the Sharples because the simple tubular bowl is so easily cleaned. Has only three pieces—no disks to wash or to get mixed up. The tubular shape gives double skimming force.

The new Sharples is ruggedly built for hard service. It is neat, compact, runs easily and oils itself.

This wonderful machine will earn you a new dairy profit—without added expense. Our new free book, ***"Velvet" for Dairymen,*** fully describes the Suction-feed. Your copy is ready. Send for it today. Address Dept. 44.

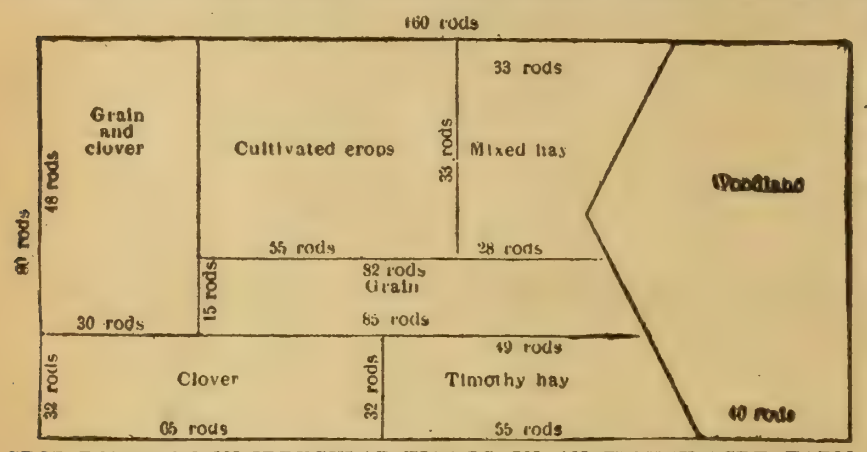
UPPER WISCONSIN

Crop Rotations For Upper Wisconsin.

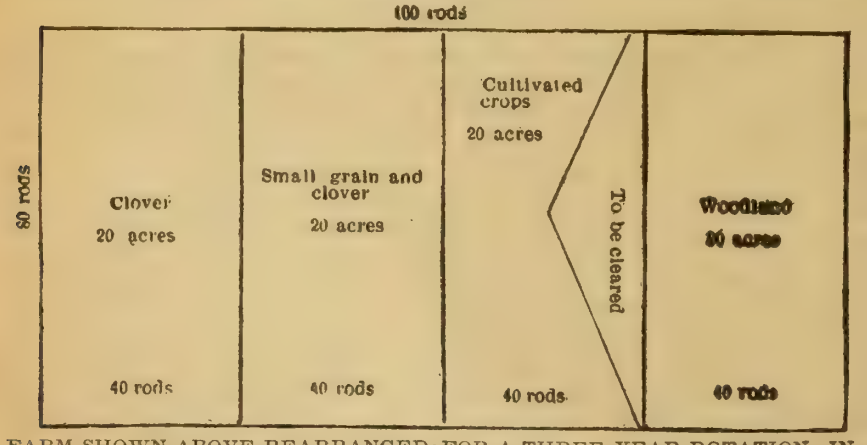
Although a considerable number of farmers of Upper Wisconsin follow some system of crop rotation, the practice is by no means general. Investigation by the Wisconsin experiment station shows that about 40 per cent of the farmers in the upper half of the state follow some form of systematic crop rotation and the interest in rotations has brought about the issuance this month of a bulletin by E. J. Delwiche on "Crop Rotations for Upper Wisconsin." Although the suggested rotations are primarily for Upper Wisconsin, they are just as applicable, in most cases, to any farm in the state. This bulletin fills a long-felt want and



CROP ROTATION ON IRREGULAR FIELDS ON AN EIGHTY-ACRE FARM, NEARLY SIXTY ACRES OF WHICH IS CLEARED.

demand from the farmers, especially the new settlers, and in succeeding issues of The Wisconsin Farmer we will discuss the suggestions for three-year, four-year, five-year rotations; the place of potatoes in rotations, etc. In those countries where agriculture is most advanced and where highest yields to the acre are obtained crops are grown almost invariably in rotation.

Many reasons for practicing some systematic crop rotations may be given. Crop rotation is necessary to maintain the productivity of the land. It is a well-established fact that continuous cropping to a single crop reduces yields which may be due to one or more of several causes. Among



FARM SHOWN ABOVE REARRANGED FOR A THREE-YEAR ROTATION. IN ORDER TO SQUARE UP THE FIELDS A SMALL TRIANGULAR WOODED PIECE HAD TO BE CLEARED.

these are the exhaustion of certain elements or compounds of plant food, the accumulation of poisonous substances in the soil, the appearance of fungous or bacterial diseases and pests, such as the chinch bug, Hessian fly and pea weevil. To a great extent, these may all be controlled by suitable crop rotations. Weeds, which also greatly reduce crop returns, can be checked in the same way. Experiments made both in this country and abroad point conclusively to the necessity of crop rotation to maintain the productivity of the soil.

The value of systematic crop rotation was evident in the results obtained on the substation farms of the state in 1910. The season was abnormally dry, the rainfall being about one-half of the normal average for the Lake Superior section. Nevertheless, the yields of grain and root crops on the substation farms were much above the average for the state. The yield of hay was not so good, being somewhat less than the average. In contrast to this, neighboring farms which had been cropped without due attention to systems of rotation, produced from one-third to one-half of a normal yield.

It is of great importance that in selecting crops to grow on a farm careful consideration be given to the matter of climate. This is practically the only factor which the farmer absolutely cannot control. For while poor soil may be improved, better markets found, better labor secured, or more capital invested, the farmer is powerless to change climatic conditions. He must, therefore, select such crops as are suited to his climate. For example, to attempt to grow a variety or type of corn which would not mature in the season of a given locality is sure to result in failure.

The soil is also a factor of great importance in the selection of a crop rotation. As a general rule, small grain crops do better on heavy than on light soil. The same is also true of grasses grown for hay. On the other hand, the same variety of corn requires a shorter season for maturity on light than on heavy soil. Rather light soils and those of intermediate texture are also better adapted to growing potatoes and root crops. Hence, on such soils a greater acreage should be devoted on hoed crops than on the heavy types.

Shipping and marketing facilities must also be considered in planning a rotation for a given farm. For instance, the farmer located on a sandy loam farm, close to a railway station or a home market, will ordinarily find it profitable to include potatoes in his scheme of crop rotation. If, on the other hand, he is located more than six or seven miles from a station the profits from growing potatoes and other bulky cash crops will be much lessened. It will then pay him better to raise more corn and roots for stock feeding and to convert these crops into dairy products, which are far less bulky and which for the same bulk have much greater value. For example, it will pay to grow clover seed on a heavy clay farm located from ten to fifteen miles from a good shipping point, where, without counting the cost of marketing, wheat, barley, oats, peas or clover seed give approximately equal returns on an acre. A load of clover seed costs no more to haul than a load of these other crops, but it is worth from seven to eight times as much.

The availability of farm labor also has an important bearing upon the selection of a rotation. By following a carefully planned rotation it is possible to distribute the farm work throughout the season much better than can be done with single or two-crop farming. Where sufficient live stock is kept to keep labor employed during the winter it is possible, if the proper rotation is followed, to do the season's work without hiring much transcient help. Lack of a supply of competent labor may make it necessary to adopt a different system of farming than would otherwise be followed. The farmer who is dependent on hired labor must carefully consider the labor factor in planning his rotation.

More capital to the acre must be invested in equipment where a rotation is followed which involves intensive farming methods than where ordinary cash crop farming is practiced. However, the returns on the investment are usually enough greater to fully justify the investment. If a farmer plans to put one-third or one-fourth of his land in corn it will, of course, be necessary for him to provide proper storage and he should plan to make good use of the crop. This means that he must have live stock and that suitable barns should be erected to shelter them. All this requires more capital than would be needed if no live stock were kept.

The size of the farm should determine, to a great extent, the character or system of farming to be carried on and the rotation to follow. Of necessity, small farms are better suited to intensive farming methods than are large places. The limiting factors, such as working capital and available labor, are usually felt more keenly on large farms. The short rotation, say that of three years, is likely to succeed best on small farms and perhaps is more necessary.

The managerial ability of the farmer, or manager, should also play an important part in selecting a rotation. Some men might succeed well in growing potatoes who could not succeed in growing crops to feed dairy animals, or the opposite might be true. To quite an extent the tastes and training of the farmer himself should determine the line of farming he is to follow.

These are some of the chief factors to be considered in working out a plan of farming. They are largely interdependent and hence should be considered with reference to one another rather than singly.

Before deciding just what crop to grow it is well for the farmer to divide his farm into fields of about equal size. This arrangement enables him to raise a more or less fixed amount of feed and forage.

Of course, it is not always possible to have every field of exactly the same size, but an effort should be made to have the areas of land in the different rotation stages as nearly of the same size as is practicable. In Upper Wisconsin, on account of the land having been cleared at different times and in different ways, fields are often irregular in outline. Much time is wasted in working such a farm. Owing to differences in soil, slope or drainage, it is not possible, on some farms, to have all land in the same stage of rotation in one single field. In most cases, however, the farm can be divided into a few fields of uniform shape and size and of the same number as there are years in the rotation followed. The sketches with this article show how irregular fields on an eighty-acre farm, of which about sixty acres is cleared land, may be arranged in a three-year rotation.

All-Wool Suit $20 Tailored-To-Order

MADE to fit, cut from our No. 1322 Superior All-wool Serge, a high quality standard fabric of unusual value. We make high grade clothes to order from any fabric and in any style of your choice at a price to fit your purse. Refinish Old Furniture.

The old furniture may look a little shabby when the spring cleaning is done, but with the expenditure of a little time and money it can be made to look like new. Mr. J. T. Parker, assistant in woodwork in the Kansas State Agricultural College, tells how to do this in a recent issue of the Industrialist.

First, the old finish must be taken off the furniture, points out Mr. Parker. This may be done with a varnish remover which may be purchased at a hardware store. Two quarts will remove the varnish from all the furniture in the average living room.

This remover should be applied with a brush or a cloth and allowed to stand for a few minutes. It must then be rubbed or scraped off. After this the scraper should be used until the wood is reached because a varnish will not take a stain.

If the wood is an open grain piece, such as chestnut, walnut or oak, a filler must be used to make a smooth surface. This may be bought or prepared at home. The formula for the preparation is as follows: One pound of corn starch and three-fourths of a pint of boiled linseed oil or turpentine, colored with burnt umber or lampblack.

A filler will color the wood slightly, but if a dark finish is wanted it is better to stain the wood before the filler is applied. The filler should be rubbed on the furniture and allowed to stand fifteen minutes. Then all the surplus filler should be removed. The wood that is not open grain, such as cypress, maple, and pine, does not need a filler.

After the stain and the filler have been applied the wood may be covered with a floor or furniture varnish or a wax. If a wax finish is desired the stain should be put on and allowed to stand until the next day, when the wax or varnish may be applied. Wax is the preferable finish, since it does not gather up the dust particles so readily as the varnish and is more easily applied. It does not scratch so easily and if it is scratched more wax may be easily added and the polish secured again.

The wax should be applied sparingly with a soft woolen cloth and allowed to stand from five to ten minutes. After this it should be rubbed vigorously to give it a polish. Two coats of wax are advised since it makes a much better finish. The wax should not be allowed to stand too long before it is polished or it will show the slightest finger mark.

If a varnish is desired it should be put on and allowed to stand two days so that it will dry properly. Then it should be rubbed with very fine sandpaper to smooth the surface. A second coat of varnish should now be added and the furniture is as good as new.

For ordinary furniture the golden oak, the cathedral oak, the early English, or the mission wood dyes are the best to use. Any of them make a more tasteful finish than the mahogany or the red and green wood dyes.

With newly finished furniture, a freshly varnished floor, a tastefully selected rug, cool cretonne curtains and a few comfortable cushions the living room is a new place in which to spend the hot summer day.

Sound Housecleaning Advice.

To the Editor:—By no stretch of the imagination can I make housecleaning "easy" work. Right here I would like to drop this thought: Our attitude toward any work goes far in making it drudgery or pleasure.

We read so much about making housecleaning a comfortable time for the men; how the poor dears are annoyed with cold dinners and the general upheaval. Well, it is just as certain that the women are eating cold dinners at the same time, and disorder in the home is a heap more trying to the average woman than to the average man. The men and boys need to cultivate the proper attitude. They can do a lot toward keeping the waters untroubled.

Why not all join in and make a game out of a hard job? Be pioneers or on a camping trip and enjoy eating on the cabinet or center table in the parlor while the kitchen is being painted, and sleeping in the parlor or kitchen while the bedrooms are being renovated.

We read a lot about doing one room at a time, piecing up the scraps into quilts, serving delicious cold dinners, etc. I have found these things won't work in the ordinary home where one woman, helped by husband and children, must see to everything. Most homes are just such common homes. I think housecleaning should be extended over as long a time as the one woman finds necessary. Health, serenity and joy in her work are of more importance than a spick and span house accomplished in three or four days.

But there is much we can do toward getting ready for the real work. Begin several weeks before by taking the curtains down, a room at a time, and laundering and laying away each week, so that no one week's washing and ironing will be greatly increased.

Take up the carpets, dust, sun, wash if necessary, and fold away until ready for them. You may not believe it, but the curtainless windows and bare floors, well wiped and with a few rugs scattered about, make you want to take a recess in your work. The change proves restful for a time.

Be sure you are well supplied with paper, paint, alabastine, varnish or whatever you have decided to use, before you start. If you paint, don't neglect to have turpentine on hand. It is very annoying to ask the man to stop work to go to town for something you should have had in store. Don't forget the bundle of clean, soft rags, plenty of soap and washing powder, and a bottle of some antiseptic, all in a convenient place.

Let the "emergency shelf" be well stocked with a few cans of fish flakes, tuna, salmon and dried beef. If you haven't canned vegetables, lay in a supply of tomatoes, corn, peas and baked beans; also a few packages of small cakes or graham crackers. Should the stranger unfortunately stop for dinner at this time you can quickly prepare a healthful, palatable meal. Fruit from the cellar, served with the cakes, is sufficient dessert.

I have no objection to the strong, healthy, bustling woman making as short work as possible of the spring cleaning. To those of limited strength and with nerves easily "set a-jangle" I say remember there is no more necessity for this hurry and flurry at housecleaning time than at any other season. Keep patient, sweet and happy and try my plan of making housecleaning a long journey, if need be, taken by easy stages.

Mary Story Whitsitt.

THE RIGHT KIND OF LIVING ROOM.
Book-filled shelves, fireplace and easy chairs make a comfortable place to read and rest.

Women at the Front.

German women have been put at the front in Petrograd and are now substituting for soldiers in the field kitchens and for work in the rear of the army, so as to release the men for fighting. This fact disposes neatly of the contention that "women should not vote because they cannot go to war."

Wanted—Rust Remover.

To the Editor:—I am interested in the household department and I have come for some help. Will some of the readers tell me how to remove rust from clothes? M. Michal.

Another Needs Help.

To the Editor:—This is the first time I have ever written to the Home Department, but I have received lots of good from it and I would like to know now if anyone knows how to destroy roaches. I have been trying to keep the house as clean as possible but all in vain. Had roaches in the house all last summer. I sprinkled insect powder about, which seemed to help some. But now this spring I notice a few here again and they are all over the house, in the cellar as well as the third floor or attic.

A friend tells me she thinks these bugs are roaches but I never saw any before, so I don't know for sure. They look black with brown specks on the wings, while others are all black. They are quite large. Their leavings or worms are about half an inch to an inch long and are brown with white underneath, and a great many feet. Can anyone tell me why they are in the house and how they first get there? They don't seem to do much harm except in the pantry, where they get into the food. But it is very horrid to have them and I can't seem to get rid of them. This is my second spring of housekeeping and I would like very much if someone could help me out, as those bugs and worms are worrying me quite a little. Mrs. S. W. Z.

To Clean Nickel.

To the Editor:—I have been a reader of your paper since last October and can hardly wait for it to arrive. I wish it would come every day, for it has been a great help to me in every way.

I am going to give some of our readers a little help in regard to keeping the nickel of a stove clean. I have found it very successful for cleaning all spots except rust. Could someone tell me how I could clean the rust off the door of the fire box?

For cleaning nickel I use a large pinch of cleaning powder, enough warm (not hot) water to make a thick suds, and to this I add a generous amount of kerosene. Then I apply it with a soft cloth, going all over the nickel with it. Then when I have all the spots off I use a dry cloth to shine it. I use pieces of old gauze, as it is soft and yet firm enough to give it a good shine.

I hope this will be a help to some of our readers, and may I hear through an early paper from some one in answer to my question? A Reader.

Remedy For Bugs.

To the Editor:—I read in your paper where a subscriber wants a remedy for destroying bed bugs. If she will put equal parts of turpentine and carbolic acid in her paste when she papers and be sure to cover all the cracks around the windows and doors she won't be troubled any more. Make the paste good and strong with the turpentine and carbolic acid.

M. P.

Wants Mincemeat Recipe.

To the Editor:—I would like for some of the ladies to send for publication in the Home Department some good mincemeat recipes. I would also like to know something about growing cauliflower and preparing it for the table. All of us should plant a little extra patch of beans, potatoes and, in fact, everything that can be stored away for winter use, for with war and rumors of war to contend with everything is high and will be higher and a good garden will go a long way toward providing for the winter.

I am sending a tested recipe for angel food cake. Whites of eleven eggs, one level teaspoonful cream of tartar, one pint of flour, one and one-half pints of sugar, one teaspoonful of vanilla. Bake forty-five minutes. First measure your flour, sugar and cream of tartar and sift together eleven times. Then whip your whites of eggs to a stiff froth. Then add gradually the sifted flour. Bake very slowly. Mrs. W. S. G.

Success in Care of Roses.

To the Editor:—In regard to Mrs. Maude Clary's questions about roses I want to say that I have had considerable success in caring for and planting roses and I think the best time to plant them is early in May, as soon as it is warm and the frost is out of the ground.

Nice black soil from the woods is a very good soil to plant roses in. Dig the hole deep and large enough so that the roots have room enough and need not be crushed when covered. Have at least six inches of loose dirt in the bottom of the hole. I usually put some of the packing around the rosebush roots, but it isn't

necessary to do this. Dirt from a barnyard, placed on top of the roots, aids the growth of the bush and keeps the roots moist.

After planting, the bushes should be shaded by shingles for about three weeks and kept well watered.

If bothered by plant lice, a louse-killing compound can be bought at any seed store.

During the winter I have my rose bushes tied to a stake driven into the ground so that the top of the stake is about three inches above the ground. The bush is tied into a bundle around the stake. Then I lay the bush on the ground and cover with leaves. If this is done, when the snow and ice has disappeared the rose bush will have nice green buds and almost open when uncovered. In order to straighten the bush after uncovering, drive a tall stake into the ground and tie the bush to this stake.

Eugene Benseur.

One Woman's Precious Vote.

Peter Gordon Mackenzie, a singer of Great Britain, thought enough of his wife's vote to apply for naturalization papers for American citizenship. Mrs. Mackenzie, an American by birth, had voted in California before her marriage, but lost her citizenship when she married an alien. The supreme court to whom she had carried a suit for recognition of her right of suffrage, made this judgment of the case and her husband, therefore, secured the right for her.

Recipes.

Nut Foam Chocolates (candy)—Two cupfuls of sugar, one-half cupful of water, one-fourth teaspoonful of cream of tartar, nuts and chocolate, one teaspoonful of vanilla, whites of two eggs. put the sugar, water, cream of tartar into a saucepan. Boil till it will harden in water. Take from the fire and add the vanilla and over the stiffly beaten whites of eggs pour the mixture. Beat until light. Drop by spoonfuls onto a buttered plate that has been spread with finely chopped nut meats., Roll each bon bon in these until entirely coated. Let cool, then dip into unsweetened melted chocolate. They should be allowed to mellow and improve with age.—Mrs. W. S. G.

Apple Sauce Cake.—One cupful of brown sugar, one scant cupful of butter, one and one-half cupfuls of apple sauce, two cupfuls of flour, one cupful of raisins, one cupful of walnut meats (English or black) two level teaspoonfuls soda sifted with the flour, one-half teaspoonful each kind of spices. Have the apple sauce fairly thick and not lumpy.—Mrs. G. G. B.

Fruit Cake.—One and one-half cupfuls flour, one and one-half cupfuls butter, one-half cupful brown sugar, one-half cupful molasses, one cupful currants, one cupful raisins, one-half cupful sour milk, one teaspoonful each cloves, cinnamon, allspice, one-half teaspoonful soda, two eggs.—Mrs. C. H. T.

Creamed Corn Beef.—Let three cups of milk scald with two slices of onion and two stalks of celery fifteen minutes. Pick out the vegetables. Beat one-fourth cup of butter to a cream; gradually beat in one-fourth cup of flour; add some of the hot milk and stir until smooth, then stir into the rest of the hot milk and continue to stir until the sauce is smooth and thickened. Cover and let cook fifteen minutes. Add three cups of cold corned beef, cut into half-inch cubes, and pour into a buttered dish. Cover with three-fourths of a cup of cracker crumbs mixed with one-third of a cup of melted butter and set in the oven to brown the crumbs.

Macaroni Baked With Cheese.—Cook a cup of macaroni broken in pieces in rapidly boiling salted water until tender. Drain, rinse in cold water and drain again. Turn into a baking dish, add about a cup of grated cheese, half a teaspoonful of salt, a dash of paprika and lift with a spoon and fork to mix thoroughly. Pour on hot milk almost to cover the macaroni and let cook in the oven until browned a little on top and very hot throughout. Serve as a vegetable at dinner or as the main dish at supper.

Fifteen per cent of the timber cut in the United States is wasted every year and government experts in Washington are engaged in experiments to determine how much may be saved by utilizing the waste. One experiment is the utilization of sawdust in the manufacture of alcohol. Another interesting possibility is the utilization of hydrolyzed sawdust as a carbohydrate cattle food.

THE YOUNG FOLKS

All letters from boys and girls to this department should be sent to office of The Wisconsin Farmer, Madison, Wisconsin.

So Many Letters.

Dear Young Folks:—The boys and girls who read the Young Folks' page have been writing so many letters that it has been impossible to use them all, and the editor has been a little worried for fear some of our little friends would be disappointed when they fail to find their letters in the paper, and we want to assure them that it is only because there is not space for all. Your letters are all very welcome, and even if they do not find a place in the Young Folks' page the editor has the pleasure of reading them and hopes that you will write again. —The Editor.

An "April Fool" Joke.

Dear Young Folks:—My mother takes the paper and I can hardly wait until it comes, for I love to read the letters on the Young Folks', page.

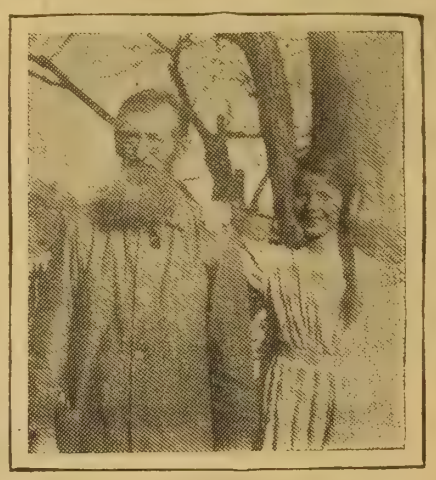
I am eleven years old. I have light brown hair and blue eyes. I go to the consolidated school and am in the sixth grade. I live on a 140-acre farm about a mile and a half from town.

I want to tell you about how we "April fooled" some people this year. My brother took an old paper sugar sack and filled it with dirt. Then he tied it up and wrote "April Fool" on each side. He then put it on the road as if someone had dropped it. Many people got fooled as they went to town.

I have never written to this department before and I hope my letter will be printed. Some time I will write again. —Susie.

Gets Two Prizes.

Dear Young Folks:—I have been reading your letters and enjoy them very much. I am staying on the farm with my grandparents and have about a mile to go to school. Our winter term closed the 3d of March. I received two prizes, a liberty bell for highest averages and a certificate of



ELLA AND GRANDFATHER.

award for being neither absent nor tardy. During my vacation I will go to see my parents. My sister is teaching me to crochet different kinds of lace.

I will tell you about my pets. I have four cats. My favorite is a large white one that I call Snowball.

I am sending you a picture of grandfather and myself. —Ella.

A Trip on the Mississippi.

Dear Young Folks:—I enjoy reading your letters and thought I would write to you. I am thirteen years old and am in the seventh grade. I like my teacher very much. She reads us good stories in spare time.

I live in the country and am one mile from school. Our farm consists of eighty acres. It is called the Pleasant Ridge farm. We have eighteen head of cattle, six head of horses, some hogs and chickens. I have for my pets one calf and three bantams. I think lots of them.

How many of the young folks like to ride horseback? I do, for one. We have just been on the farm one year since we came back from our trip to Florida. I will tell you a little about it. My father's health was not very good and the doctor told him to go South. We went part of the way on the train and then took the steamer and went down the Mississippi and Ohio rivers. It was a fine trip and we liked Florida pretty well, but we were glad to get back on the farm.

—Esther.

Sings at Entertainments.

Dear Young Folks:—I have been reading your letters and enjoy them very much. I have never written before.

I live on a farm and we have four horses, three cows and some hogs. I like to live on the farm. I have always lived on the same farm.

My mother died when I was seven years old. I have a sister and brother older than myself. My sister does most of the housework. My father is good to us and we have a good home. I have a big dog for my pet. His name is Sport.

I go to school every day. Our dog comes to meet us when we come from school.

We have a music teacher in our township. I like music and I sing songs by myself at the school entertainments. —Roy.

Your Mother Saved Money on Soap

Why Don't You?

Years ago, your grandmother made soap because she couldn't buy it. She taught your mother to make it and your mother can teach you because the important ingredient that your grandmother used is still for sale everywhere.

Lewis' Lye

The Standard for More Than Half a Century

The modern housewives do not appreciate how easily you can make clean, firm soap at home. Good lye is the secret. Lewis' Lye is good lye because it saponifies the grease perfectly and entirely. It makes just as good soap as you can buy—better than many—and it makes it cheaper. Get a can at your dealer's today and try it out at once. Lewis' is the lye you'll like for the many household uses.

International Sunday School Lesson.

Lesson for April 23, 1916.

(By E. O. SELLERS, Acting Director of Sunday School Course.)

EASTER LESSON.

LESSON TEXT—I Cor. 15:1-28.

GOLDEN TEXT—But now is Christ risen from the dead, and become the first fruits of them that sleep.—I Cor. 15:20.

If teachers can impress indelibly upon the minds of their scholars the fact that Jesus rose from the dead and is as truly alive today as when walking the hills of Galilee this repetition of the Easter story will not be in vain. For the pupils to take notes of the points of the argument and to recite upon those notes at the end of the class hour would greatly help to fix the facts in their minds. This account considered today is perhaps the oldest written record we have of this great fact, written about 56 A. D., hence the significance of verse six.

1. **The Triumphant Fact** (vs. 1-4). If Christian workers would be more familiar with this passage they would more intelligently understand what the term "Gospel" means. The fact of the resurrection loomed larger in Paul's mind than the virgin birth; the former was and is the greater miracle. This, one of the supreme chapters of the Bible, tells us what the gospel is, and what its results are to be. (1) What it is. Not a new cure for tuberculosis, nor a new social environment, but the good news of one who was God incarnate (Paul does not use his earthly name Jesus), Christ the Anointed One, who died for our sins just as the Scriptures had foretold, and was buried. On the third day, "according to the Scriptures," He rose again and is now and ever shall be alive. Any gospel that ignores the incarnation, passion and resurrection of Jesus is false to the Scriptures and a lie. (2) The result of preaching or testifying to this great program is twofold: First, salvation, "saved, restored to right relations with God;" and second, perseverance, "wherein ye stand." The "God-story," good news, evangel or gospel—they are all the same—is "the power of God unto salvation," and the strong doctrine of the resurrection will cause men to walk straight, to stand upright. "Christ died for my sins according to the scriptures" (Isa. 53:5-10).

II. **Witnesses to the Fact** (vs. 5-12). Paul (v. 3) received the resurrection truth from many witnesses, whom he

proceeds to enumerate, for it was not a matter of his own invention. The incredulity of the disciples at the first is frankly recorded (Luke 24:12). Jesus did not appear first to John, Pilate or the Sanhedrin, but to a woman, and the change of the apostles from a spirit of despair to that of confident, joyous certainty was most astonishing. There are eleven recorded appearances of Jesus after His resurrection, and not one of them was made to His enemies. Paul does not mention all of the appearances. He is probably naming only those persons, witnesses of His appearances, with whom He had conversed, or at least a few from each group. (1) Peter, referred to indirectly in Luke 24:34; (2) the apostles, to be exact, the first ten, Judas being dead and Thomas absent; (3) the apostles with Thomas present; (4) 500, the only record of this great company, though perhaps implied in the "brethren" of Matt. 28:10. "Half a thousand witnesses are enough to establish any case." Of these the greater number were alive twenty-five years after the event; (5) James, probably our Lord's brother, the honored head of the Jerusalem church; (6) "Then all the apostles," a larger circle than the twelve (See Luke 28:48, Acts 1:6-8). This may have been the appearance in the morn at the Sea of Galilee; (7) "me also."

III. **The Fact Applied.** (vs. 13-20). The Corinthians, to whom Paul was writing, did not deny Christ's immortality, but seemed to deny that the same power which had raised Him could be applied to us who are only human. Paul answers this by presenting four arguments:

(1) The resurrection of Christ proves the possibility of the resurrection from the dead, if only of Jesus. The Sadducees taught the contrary. The Stoics taught that the dead were re-absorbed in God. To say Christ is not risen is to claim death as annihilation, to destroy faith in Jesus (v. 14) and to impugn the testimony of those who had seen him (v. 15). A dead Christ means dead Christians (v. 17) and our heaviest sorrow will be to face the grave (v. 18).

(2) The Christian is "in Christ," and His resurrection carries ours with it. Paul's emphasis upon this term "in Christ" (vs. 18, 19, 22, 23 and elsewhere) is important to note.

(3) Christ, the second Adam, brings life; our common human nature dies like as the first Adam, but our second Adam rose and "in Him" we live.

(4) If Christ conquered death only for Himself it was no real victory, nor could He give back to the Father a redeemed world.

Death is the last "enemy," for until sin is banished it will be present (Rom. 6:23).

Beware Turnip Rape Seed.

Two hundred thousand pounds of turnip rape seed, or enough to sow approximately 50,000 acres, have been imported from Argentina and Japan and are being sold as winter rape. The seed specialists of the U. S. Dept. of Agriculture, therefore, are again cautioning farmers to avoid the purchase and seeding of turnip rape—which is not winter rape and is not suitable for the forage purposes for which winter rape is grown.

The seeds of turnip rape are smaller and have more deeply pitted surface than those of winter rape. The young plants are easily distinguished by the difference in habit of growth and the character and color of the leaves. Winter rape produces a definite stem with the leaves occurring along it at intervals. Turnip rape does not produce a definite stem, the leaves all growing in an apparent whorl at the surface of the ground. The leaves of winter rape are thick and succulent, free from hairs, and covered with a grayish bloom. The leaves of turnip rape are thin, hairy and bright green like those of the garden turnip.

Persons purchasing rape seed may submit samples to the Seed Laboratory, U. S. Dept. of Agriculture, Washington, D. C., for determination as to whether the seed is that of the turnip rape or winter rape. Samples of both turnip rape and winter rape seed, for comparison, will be sent on application to the Seed Laboratory.

Trees Increase Crops.

Trees will actually increase the yields of crops. This was determined by an investigation in Minnesota, Iowa, Nebraska and Kansas. It was found that one-fifth of the farm could be in trees without reducing the yield. That is, trees, in protecting the crops, increased the crops enough to make up for the space occupied by the trees. From this it is plain that the resulting trees would not cost anything except the cost of the planting and care. This same thing has been found to be the case in Europe. As a result the general plan there is to have one-third of the land area in trees. And the reason is that this is the way that the greatest returns are secured.

If one-fifth of the area of Minnesota, Wisconsin and North Dakota can be in trees without reducing the yield of the crops, perhaps even a greater proportion of the land in North Dakota could be in trees without reducing the yields.

The planting of trees would do much to make a state like North Dakota a more homelike state. The trees would also reduce the effects of winds and especially of hot winds. The spreading of weed seed would be lessened. The light soils would not blow and the snow would quietly settle where it fell.—[North Dakota Experiment Station.

Tractor show for Wisconsin will be held at Madison the week of September 4th-8th. This is one of the big national shows.

HYATT ROLLER BEARINGS

Add to the Life of Farm Machines

The hollow Hyatt rollers cushion shocks due to holes in the road or obstacles in the field. This protects the surrounding parts and saves the entire machine from sudden strain.

The hollow Hyatt rollers help to keep shafts and gears in alignment by neutralizing the effect of the twisting and bending of the frame of the machine as it travels over rough, uneven ground.

Particles of dirt and grit do not grind away the bearing surfaces. Foreign matter passes through the slots in the roller to the hollow center.

A steady circulation of the lubricant is going on all the time the Hyatt bearing is in motion, thus reducing friction and wear to the lowest point.

These advantages mean much to the man on the farm who, for the most part, repairs his own machines.

Make Sure That Hyatt Roller Bearings Are a Part of Your Automobile and Tractor.

HEPSEY BURKE--A Sister to David Harum

By G. N. Wescott, the Brother of the Author of "David Harum."

(Copyright 1915.)

CHAPTER XVI.
Notice to Quit.

BEFORE the year was over Mrs. Betty had become popular with Maxwell's parishioners through her unfailing good nature, cordiality and persistent optimism. Even Mrs. Nolan, who lived down by the bridge and made rag carpets and suffered from chronic dyspepsia, remarked to Mrs. Burke that she thought the parson's wife was very nice "'cause she ain't a bit better than any of the rest of us"—which tribute to Mrs. Betty's tact made Mrs. Burke smile and look pleased. All the young men and girls of the parish simply adored her, and it was marvelous how she managed to keep in touch with all the guilds, do her own housework and learn to know everyone intimately. Hepsey warned her that she was attempting to do too much.

"The best parson's wife," she said, "is the one who makes the rest work, while she attends to her own household and keeps her health. Her business is not to do the work of the parson, but to look after him, keep him well nourished and cheer him up a little bit when he is tempted to take the next trolley for Timbuctoo."

The retort was so tempting that Mrs. Betty could not help saying:

"There's not a person in this town who does so much for others as you do and who makes so little fuss about it. It's the force of your example that has led me astray, you see."

"Hm!" Hepsey replied. "I'm glad you called my attention to it. I shall try to break myself of the habit at once."

As for Maxwell, his practical cheerfulness in forwarding the social life of the place, without in the least applying that phase of his activities as a lever for spiritual upheavels, and his ready sympathy for and interest in the needs and doings of young and old, irrespective of class or caste, gradually reaped for him the affection and respect of all sorts and conditions. In fact, the year had been a pleasant one for him and was marred by only one circumstance, the continued and growing hostility of his Senior Warden, Mr. Bascom. From the first he had been distinctly unfriendly towards his rector; but soon after Maxwell's marriage his annoying opposition was quite open and pronounced, and the weight of his personal influence was thrown against every move which Maxwell made towards the development of the parish life and work.

To those more "in the know" than the Maxwells themselves it was evident that a certain keen aggressiveness evinced by the Senior Warden was foreign to his phlegmatic, brooding character, and it was clear to them that the actively malicious virus was being administered by the disappointed Virginia. That she was plotting punishment, in revenge for wounded amour propre, was clear to the initiated, who were apprehensive of the bomb she was evidently preparing to burst over the unconscious heads of the rector and his wife. But what could her scheme be?

Gradually Mrs. Burke noticed that Betty began to show fatigue and anxiety and was losing the freshness of her delicate color, while Donald had become silent and reserved and wore a worried look which was quite unnatural to him. Something was going wrong; of that she felt sure; but observant though she was she failed to trace the trouble to its source.

Matters came to a crisis one day when Maxwell was informed that someone was waiting to see him in the parlor. The visitor was dressed in very pronounced clothes and carried himself with a self-assertive swagger. Maxwell had seen him in Bascom's office and knew who was waiting for him long before he reached the parlor by the odor of patchouli which penetrated to the hall.

"Good morning, Mr. Nelson," said Maxwell. "Did you wish to see me?"

"Yes, I did, Mr. Maxwell, and I am sure it is a great pleasure."

The man seated himself comfortably in a large chair, put the tips of his fingers together and gazed about the room with an expression of pleased patronage.

"Very pretty home you have here," he remarked suavely.

"Yes," Maxwell replied. "We manage to make ourselves comfortable. Did you wish to see me on business?"

"Oh yes," the lawyer replied, "a mere technicality. I represent the firm of Bascom & Nelson, or rather I should say I am Mr. Bascom's legal agent just at present, as I have not yet been admitted as his partner—"

The man stopped, smirked and evidently relished prolonging his interview with Maxwell, who was getting impatient. Maxwell drew his watch from his pocket and there was a look in his eye which made the lawyer proceed:

"The fact is, Rector, that I came to see you on a matter of business about the rectory—as Mr. Bascom's agent."

"Will you kindly state it?"

"It concerns the use of this house."

"In what way? This is the rectory of the church and the rental of it is part of my salary."

"You are mistaken. Mr. Bascom owns the house and you are staying here merely on sufferance."

For a moment Maxwell was too astonished to speak; then he began:

"Mr. Bascom owns this house? What do you mean? The house is part of the property of the church."

"You are mistaken, my friend."

"You will kindly not repeat that form of address and explain what you mean," replied Maxwell heatedly.

"Come, come; there's no use in losing your temper, my dear rector," retorted Nelson offensively.

"You have just two minutes to explain yourself, sir; and I strongly advise you to improve the opportunity, before I put you out of this house."

Nelson, like most bullies, was a coward, and evidently concluded that he would take no risks. He continued:

"As I said before, Sylvester Bascom practically owns this house. It does not belong to the church property. The Episcopals made a big bluff at buying it years ago and made a very small payment in cash; Bascom took a mortgage for the rest. The interest was paid regularly for a while and then payments began to fall off. As you have reason to know Bascom is a generous and kind-hearted man, who would not for the world inconvenience his rector and so he has allowed the matter to go by default until the back interest amounts to a considerable sum. Of course, the mortgage is long past due and as he needs the money he has commissioned me to see you and inform you that he is about to foreclose and to ask you to vacate the premises as soon as you conveniently can. I hope that I make myself reasonably clear."

In a perfectly steady voice Maxwell replied:

"What you say is clear enough; whether it is true is another matter. I will see Mr. Bascom at once and ask for his own statement of the case."

"I don't think it necessary to see him, as he has expressly authorized me to act for him in the case."

"Then I suppose you came here to serve the notice of ejectment on me."

"Oh, we won't use such strong language as that. I came here merely to tell you that the house must be vacated as soon as possible. Mr. Bascom has gone to New York on business and will not be back for two weeks. Meanwhile he wishes the house vacated so that he can rent it to other parties."

"When does the Senior Warden propose to eject his rector, if I may be allowed to ask?"

"Oh, there is no immediate hurry. Any time this week will do."

"What does he want for this place?"

"I believe he expects fifteen dollars a month."

"Well, of course, that is prohibitive. Tell Mr. Bascom that we will surrender the house on Wednesday and that we are greatly indebted to him for allowing us to occupy it rent free for so long a time."

As Donald showed the objectionable visitor out of the house he caught sight of Hepsey Burke walking towards it. He half hoped she would pass by, but with a glance of suspicion and barely civil greeting to Nelson as he walked away she came on and with a friendly nod to Maxwell entered the rectory.

"I've just been talkin' to Mrs. Betty for her good," she remarked. "I met her in town lookin' as peaked as if she'd been fastin' double shifts, and I had a notion to come in and complete the good work on yourself."

Maxwell's worried face told its own story. He was so nonplused by the bolt just dropped from the blue that he could find no words of responsive raillery wherewith to change the subject.

Hepsey led the way to the parlor and seated herself, facing him judicially. In her quick mind the new evidence soon crystallized into proof of her already half-formed suspicions. She came straight to the point.

"Is Bascom making you any trouble? If he is, say so, 'cause I happen to have the whip-hand so far as he's concerned. That Nelson's nothin' but a tool of his and a dull tool at that."

"He's an objectionable person, I must say," remarked Maxwell, and hesitated to trust himself further.

Mrs. Burke gazed at Maxwell for some time in silence and then began:

"You look about done up—I don't want to be pryin', but I guess you'd better own up. Something's the matter."

"I am just worried and anxious and I suppose I can't help showing it," he replied wearily.

"So you're worried, are you. Now don't you get the worried habit; if it makes a start it will grow on you till you find yourself worryin' for fear the moon won't rise. Worryin's like usin' rusty scissors, it sets your mouth awry. You just take things as they come and when it seems as if everything was goin' to smash and you couldn't help it put on your overalls and paint a fence or hammer tacks, or any old thing that comes handy. What has that rascal Bascom been doin'? Excuse me—my diplomacy's

FOR Minnesota improved farms and land bargains, write or call on H. A. Hanson, 242 Temple Court, Minnea polis, Minnesota.

of the hammer-and-tongs order; you're not gettin' your salary paid?"

For some time Maxwell hesitated and then answered:

"Well, I guess I might as well tell you, because you will know all about it anyway in a day or two and you might as well get a correct version of the affair from me, though I hate awfully to trouble you. The parish owes me two hundred and fifty dollars. I spoke to Reynolds about it several times, but he says that Bascom and several of his intimate friends won't pay their subscriptions promptly and so he can't pay me. But the shortage in my salary is not the worst of it. Did you know that the rectory was heavily mortgaged and that Bascom holds the mortgage?"

"Yes, I knew it, but we paid something down and the interest's been kept up and we hoped that if we did that Bascom would be satisfied."

"It seems that the interest has not been paid in some time and the real reason why Nelson called just now was to inform me that as Bascom was about to foreclose we must get out as soon as we could. I told him that we would leavè on Wednesday next."

For a moment there was a look on Mrs. Burke's face which Maxwell never had seen before and which boded ill for Bascom, but she made no immediate reply.

"To tell you the truth," she said finally, "I have been afraid of this. That was the only thing that worried me about your gettin' married. But I felt that no good would come from worryin,' and that if Bascom was goin' to play you some dirty trick he'd do it; and now he's done it. What's got into the man all of a sudden? He's a skinflint—always closer than hair to a dog's back, but I don't believe I've ever known him to do somethin' downright ugly like this."

"Oh, I know well enough," remarked Donald. "If I had been aware of how matters stood about the rectory I should have acted differently. I wrote him a pretty stiff letter a day or two ago calling upon him, as Senior Warden, to use his influence to fulfill the contract with me and get the arrears of my salary paid up. I suppose he had thought I would just get out of the place if my salary was held back—and he's wanted to get rid of me for some time. Now he's taken this other means of ejecting me not only from his house but from the town itself. He knows I can't afford to pay the rent out of my salary—let alone out of half of it!" He laughed rather bitterly.

"He'll be singing a different tune before I've done with him," said Hepsey. "Now you leave this to me—I'll have a twitch on old Bascom's nose that'll make him think of something else than ejecting his rector. I'll go and visit with him a little this afternoon."

"But Nelson said that he was in New York."

"I know better than that," snorted Hepsey. "But I guess he'll want to go there and stay the winter there, too, maybe, when I've had my say. No sir—I'm goin' to take my knittin' up to his office and sit awhile and if he doesn't have the time of his life it won't be my fault."

She turned to leave the room, with a belligerent swing of her shoulders.

"Mrs. Burke," said Maxwell gently, "you are kindness itself, but I don't want you to do this—at least not yet. I want to fight this thing through myself, and rather to shame Bascom into doing the right thing than force him to do it—even if the latter were possible. I must think things out a bit. I shall want your help—we always do, Betty and I."

"I don't know but you're right, but if your plan don't work, remember mine will. Well, Mrs. Betty'll be coming in soon and I'll leave you. Meantime I shall go home and load my guns. I'm out for Bascom's hide sooner or later." (To be continued.)

POTATOES AND SEEDS ALMOST GIVEN AWAY.

TO INTRODUCE—I offer 20 Big Hills of genuine Early Six Weeks' Potatoes—best quality and earliest in the wide world—also $1.00 worth the finest Vegetable and Flower Seeds—all mailed for 30 cents. COOK, Seedsman, Hyde Park, N. Y.—Adv.

Making Housework Easier.

(Continued from page 8.)

to bring up wood, coal, vegetables, preserves, etc., from the cellar, although apparently a small thing, is one of the backache savers in any home. A sliding panel between the dining room and the kitchen, through which food can be passed, saves many steps each meal.

Even the location of the telephone is worthy of consideration. And it, with many others, is considered and discussed at length before definite locations are selected. The cost of each is an important part of every discussion, for the amount available for the new house may prohibit some things which later on will be added, and for which provisons must be made in planning.

After this, the house is equipped. Lists are made after a discussion has been made as to styles of furniture and prices of every article for each room are determined. Furniture, rugs, pictures, lamps, table linen, dishes, bed linen, and all are included.

Each girl makes two or three lists complete. One shows what would be purchased had the girl $1,000 to spend; one had she but $500 and a third showing her proposed expenditure of $250 for furnishing the complete home. The list takes up even a detailed statement of the kitchen equipment showing just what articles are deemed necessary in the three lists, and the proportionate expense to the rest of the home furnishings.

It is interesting to note that in many instances the girls will select a less expensive pattern for their china to have enough funds to insure a washing machine, or a bread mixer, or a vacuum cleaner. Every effort is made to have a wise selection made for the money available.

When these girls complete their courses at the school and return home they have a pretty definite idea as to how to make the work at home easier, and have more fun. The ideas are practical, for they know how much can be done with a certain amount of money whatever is available, and the work which was a drudgery becomes a pleasure because they realize how much intelligence and training it takes to run a household in the easiest and most pleasant manner.

The school meets the needs of two classes of people. There is one course from which a girl entering from eighth grade or grammar school graduates in three years. This prepares her to be an intelligent and happy home-maker capable of doing either all the work of a home such as sewing, cooking, laundering, accounting, etc., or of supervising as many maids as she may be fortunate enough to have.

The second course requires four years of study before graduation. This is for girls who wish to continue their education at a normal school, college, or university.

Work along these lines in Wisconsin is in a very thorough stage of development, although comparatively new as a county educational school system. Efforts are being made to establish more schools of this sort in localities which need them. The work is absolutely in accord with the general educational system of the rural, city and accredited schools, as well as the normal and university courses, where a desire is expressed on the part of the student to make it a part of her general educational plans.

Inter-County Holstein Breeders' Sale.

One of the most successful consignment sales of Holstein cattle held since the foot-and-mouth disease started, was that of the Inter-County Holstein Breeders at Watertown, Wis., Wednesday and Thursday, April 5th and 6th. The offering was one of particular merit and drew buyers from several states. It is very evident that the scare over foot-and-mouth disease has entirely disappeared and cattle breeders and dealers in southern Wisconsin say that they have never seen such a great demand for cattle as there is at the present time. At this sale there were buyers from Kentucky, Michigan, Ohio, Illinois, Iowa, Kansas, West Virginia, California and Minnesota, as well as from northern and western Wisconsin. The top price was paid by W. S. Moscrip, Lake Elmo, Minn., for Johanna Rue Burke 2d. Her daughter was sold for $700 to F. Johnson, Swanson, Mich. Altogether it was a very good sale and indications are that the demand for dairy animals is steadily growing. Below we list those selling for $50 and over:

Cut Your Feeding Costs In Half

Alfalfa Recutting Attachment

Yes, sir! Clean in two. Don't say you *can't*. For *thousands* of farmers are doing it *every day*.

They are *selling* their No. 1 hay and milling their *off grades* for feeding. They are fattening cattle, sheep, hogs and poultry with the *finest* alfalfa chop you ever saw. They are making *combination feeds* of alfalfa with oats, corn and peas. Many are milling clover, rice straw, bean straw, pea vines and *dried cornstalks*. Alfalfa—leaves, stems and all—is made into a fine grade of chop without injuring the color of the hay. The only way you can do this and get a positive guarantee of big capacity (1200 to 2700 lbs. of meal per hour) is with the wonderful recutting attachment in sizes 12 to 26.

Grip Hook Feed Table

Smalley

(7 sizes) Silo-Filler (7 sizes)

No grinding or hammering. Powerful, whirling, bevel-edge blades cut like a lawn mower. Feed is fine, even and uniform resulting in *greater tonnage* in the silo. Famous grip hook, forces feed table saves work of *two men*. Wide flaring sides and deep throat on every cutter.

Patented, low-speed, one pulley chain drive not only makes a *cleaner, faster* job, but saves one-fifth to one-fourth *power cost* and cuts out *unnecessary wear* on belt. Blower is built *independent* of cutter so fan speed can be increased or decreased *without changing speed of knife or shaft*.

Powerfully built for hard, long service. See for yourself how *thousands* of farmers are cutting feeding costs in two; saving time, labor and power costs; getting better and greater silo tonnage. Send for the handsome, illustrated FREE Book *today*. It tells the story.

SAFETY STORM BLAST LANTERN FREE

This Safety Lantern cannot catch fire or explode. It is absolutely safe at all times and on all occasions. If you drop it in the hay loft, no oil can escape; if the cow kicks it over, it goes out at once.

It cannot blow out in a cyclone because of the storm blast feature. It is just the kind of a lantern every farmer needs about the house and barn.

Patent opening device raises and swings the globe free for lighting, filling and trimming. This lantern is fully guaranteed and is endorsed by the highest authorities on fire insurance, fire fighting and explosives. If dropped or turned over it immediately goes out. Oil cannot run. Impossible to catch fire. A lantern you will always feel safe with in the house or barn.

OUR OFFER

Send $2.00 for a three year new or renewal subscription to The Wisconsin Farmer and we will send you one of these Safety Storm Blast Lanterns as a premium free and postpaid.

VETERINARY

PROFESSIONAL Veterinary advice through this department to regular subscribers only. We do not answer veterinary inquiries for the benefit of "neighbors." Parties desiring information will be required to send their names in full with their address. No question will be answered by mail unless accompanied by a fee of one dollar. In order that correct information may be given, the symptoms should be accurately described, stating of how long standing, together with color and age of animal, and what treatment, if any, has been resorted to. Thoroughly good and reliable veterinary remedies are advertised from time to time on these pages. If they were not good and reliable they could not appear in our paper. Our readers are requested to look them over. You may find here some remedy which will exactly fit your case. All veterinary inquiries should be addressed to this office.

AILING ANIMALS.

Loss of Pigs.

Does it affect small pigs before they are born to feed their mother ground barley? Have had two sows farrow and all the pigs from one of them were dead when they were born and from the other the first four were alive and seven were dead.

If a good grade of barley is used it should have no ill effects on your sows, causing them to lose their pigs.

Sterility in Mare.

I have a Shire mare, nine years old, which had a colt when four years old and, although she has been bred every year since, both natural and artificial, she will not get with foal. She looks healthy. The last time she was bred she remained in heat for two weeks and then came in heat in twenty-one days. Please let me know what to do with her.

There are a number of conditions any one of which may be the cause of your mare not being able to conceive. Among them are lax condition of womb, diseased ovaries, excessive heat periods, etc. Would advise you to have a competent veterinarian examine this mare and see if he can find the cause of the trouble.

Heaves.

I have two horses, fifteen and twenty years old, which are affected with heaves. They are rather thin. Their teeth are fairly good. I would like to put more flesh on them. Would Fowler's Solution or Arsenic be good for them? Please tell me how to feed it. Would it stop the heaves?

Fowler's Solution would be a good general tonic for these horses and might be some aid in holding heaves in check if proper attention is also paid to feeding. Feed small amounts of wholesome hay and good ration of grain. Water often and not so heavy at one time. Give from two to four teaspoonfuls of Fowler's Solution of Arsenic in half a pint of water once daily.

Cough and Scouring in Calves.

My calves cough and get very thin and when they drink their milk they shake themselves all over. They have the scours badly also. They have been sick all winter and have had ringworms. I feed them separator milk and calf meal and second crop hay.

Your calves seem to be victims of some digestive disorder which may be parasitic in origin or may come from some undesirable feed. However, it would be hard to state just what the primary cause of this disorder is without a thorough examination of the animals, the feed and water supply, etc. You should secure the service of a competent veterinarian and have him examine the animals.

Nodular Disease.

We have lost six ewes this winter, some before lambing and some afterward. Have also had this trouble before. They become weak, the liver turns whitish and the blood becomes watery. Sometimes the intestines and the viscera almost rot. The intestines have nodules too. What is the trouble and what can be done to cure?

Your sheep are probably victims of nodular disease, which is caused by an internal parasite which affects the intestines in the cystic form. Nothing can be done to rid animals of the cystic form, but the adults may be gotten rid of by use of some of the vermifuges, such as creosote and thymol. Sanitation is all-important. Clean up the premises and if possible rotation of pastures should be practiced.

General Debility.

I have a horse that I have been feeding alfalfa for some time and was working him all the time. About a month ago he began to lose in flesh, then he got lame in the right hind leg. After a while he got tired and lay down. He ate well and walked well, but after a while began to weave from one foot to the other. He is eight years old. What would you advise me to do? I have had two local veterinarians.

Your description of this case is not very clear and, therefore, it would be hard to make a diagnosis with any certainty. It seems if you have had two local veterinarians and neither knew the trouble that there is little use for one who has not seen the animal to attempt a diagnosis.

Indurated Areas on Udder.

I have several cows that have hard bunches in the udder about the size of a goose egg. Some have it close to the teats and some about half way between. I have tried turpentine, lard and salt. This is generally very good, but I am getting poor results. The cause I think comes from cold cement, as they scratch the bedding away. They are heavy milkers.

It is possible the indurated areas on your cows' udders have been brought about by coming in contact with the cement floors. These spots may be of just a callous nature and some may be of an abscess nature. It would not be advisable for us to advise you until the exact character of the swellings are known. Since you have more than one cow affected and they are heavy milkers it would be policy for you to have a veterinarian examine these cows and offer treatment and also any other advice needed as to prevention, etc.

Stricture of Milk Duct.

I have two fresh milk cows that seem to have a lump in one teat. I can't get much milk from that teat at a time, just have to strip it. Is the milk good to use? Tell me what causes this and what I can do for it.

These cows are troubled with stricture of the milk duct. Sometimes this can be remedied by use of a stricture remover, but the best thing to do is to fatten and sell such animals before they give you too much trouble. A milking tube may be used on such cases and the milk let run out at milking time. The tubes should be thoroughly cleansed before using each time.

Abortion in Cattle.

Can you tell me the cause of abortion in cattle and what the remedy is, if there is one that can be depended upon? Also please tell me whether or not the cow may be infected through the bull which has served cows that have aborted. If so, is there anything that can be done to disinfect or sterilize the bull so as to do away with this condition? I have heard a number of surmises and guesses about this matter and I will appreciate some authoritative information.

The subject of abortion is a big one and if of the infectious nature the treatment and eradication are still bigger than the subject. The cause of infectious abortion is the bacillus of infectious abortion gaining entrance into the generative organs. As to prevention and treatment, the first thing to do is to remove noninfected animals from infected animals and then thoroughly clean up and disinfect the premises. You should burn the dead fetus along with membranes and afterbirth. Males which have covered infected females, or in which there is a suspicion in this direction, should be subjected to treatment by cutting the hair off the end of the sheath and then washing the prepuse sack with a ½ to 1 per cent lysol solution or 1 per cent soda solution. Following each covering the washing should be repeated with pure lukewarm water or one of the above solutions. In treating those cows which have aborted the vagina and uterus should be irrigated with warm antiseptic solution 1 to 2 per cent creolin or lysol. This treatment should be continued at first once or twice daily and later every two or three days until the discharge has ceased for several days. Do not breed the animals for at least two months after abortion and subsequent treatment. Treatment of contagious abortion takes time and patience and should be supervised by a competent veterinarian, and in this way some results may be realized.

American Beauty Buggies

$56.95

Always on Trial

If at any time you feel that your American Beauty Buggy is not giving you the service you have a right to expect, you can return the buggy to us and we will send you your money together with any freight charges you paid.

It takes the highest quality of material and workmanship to stand a trial offer like this. There are no better buggies made today than American Beauty Buggies, and by shipping from a warehouse near you we are able to lay down at your station a genuine American Beauty Buggy at a price that means a very large saving.

$26.95 and Up

Holstein Sale by the Lake Mills Consignment Sales Company.

THE Lake Mills Holstein Breeders' Consignment Sales Co., will hold their thirteenth semiannual sale. Tuesday and Wednesday, May 2d and 3d, in the company's sales building, Lake Mills, Wis. This will probably be one of the greatest Holstein sales ever held in Lake Mills or even in the middle West. The company's high reputation for fair dealing, the brisk demand for cattle this spring and the excellent quality of the cattle consigned will tend to make this sale a great success. More extra-choice cattle are entered in this sale than heretofore, and a greater number of cows have outstanding records of their own. Fletcher Bros., Waupun, Wis., have among others a 26.66-pound daughter of Sir Netherland Korndyke. Fred M. Smith, Elkhorn, Wis., consigns a number of fine A. R. O. cows bred to Dutchland Sir Pietertje Colantha. F. J. Bristol & Sons, Oakfield, Wis., have a large consignment of excellent quality, among which are several fine sons of the famous bull, King Segis Pontiac Polkadot, also a number of very choice females with good two-year-old records, including a 21.5-pound two year old sired by Johanna McKinley Segis and out of a twenty-five-pound dam. S. M. Randall, Waupun, Wis., consigns a number of fine animals bred to Joe Oak De Kol Fobes, among them an 18.88-pound two year old. F. B. Green & Son, Evansville, Wis., have a choice consignment of cows, some of which will raise their records before the sale. In addition they have a remarkably well-bred bull from Canary Homestead Oak De Kol and a 24.63-pound three-year-old. Geo. Williams, Orfordville, Wis., offers a fine bunch of young heifers, some bred to Dwight Aaggie Segis Johanna. H. S. Hoard, Madison, Wis., has a large consignment of a number of good A. R. O. cows. His lot includes a nice bunch of choice, well-bred heifers, bred to Colantha De Kol Pietertje, a thirty-pound son of Colantha Johanna Lad. S. C. Stanchfield, Fond du Lac, Wis., consigns some fine A. R. O. cows with records up to 23.44 pounds, most of them bred to Colantha Johanna Champion 4th. John Hetts, Ft. Atkinson, Wis., has entered a number of choice young heifers, sired by Mutual Piebe De Kol, Johanna King of Rock and King Segis Hengerveld of Rock. C. E. Friday, Oregon, Wis., offers a half dozen good young cows, bred to his registered sire, Emblagaard Tritomia Joseph, which is to be sold. The estate of Dr. H. B. Favill offers five very choice cows with the following records: 23.06, 20.88, two at nineteen and one at seventeen. Some of these cows, which will be retested before the sale will show an increase over their present records. C. C. Fries & Son, Richland Center, Wis., have in the sale a fine bunch of first-class A. R. O. cows, which will be heard from in the future if given the right kind of care. De Kol Pietertje Vale, with a present record of 22.375 pounds, is expected to develop into a thirty pounder. Richland Pontiac Butter Boy, a grandson of Pontiac Butter Boy and from a 31.77-pound four year old is perfect in every way and will make an excellent herd header. Anyone who can possibly be in Lake Mills, May 2d and 3d, should do so and see this great sale and also get some dependable cattle. The same company will hold another sale at Watertown, Wis., Thursday and Friday, May 6th and 7th. Write for catalog, which contains full list of consignments and other facts well worth while. Address Frank H. Everson, Mgr., Lake Mills, Wis. See page 29.—Adv.

Northrup, King & Company's Seed Book.

IT IS reported that only 5 per cent of the 1915 corn crop is fit for seed, because the weather was unfavorable for its proper development. Even if 1915 seed corn should germinate, the possibility of its maturing thoroughly is very small unless the weather for this season is nearly ideal. A comparison of the vitality of 1914 and 1915 seed corn, sprouted in boxes, is shown on page 11. Northrup, King & Co., Seedsmen, Minneapolis, Minn., in their latest catalog have an interesting discussion of the failure of the 1915 seed corn crop. They explain why the 1914 seed corn, which they are selling, has greater germinating power and vitality than 1915 seed. The catalog also contains valuable information on other seeds and is a practical planting guide for garden and field. Wisconsin Farmer readers should send for a copy of this catalog, which will be a great help in selecting seed for this season's planting. It will be sent free to any address upon request if you mention The Wisconsin Farmer.—Adv.

Perfect Skimming Efficiency in United States Separators.

IN actual working tests at the Pan-American and Alaska-Yukon Expositions, the United States cream separator scored perfect in skimming efficiency. This same perfection is found in United States separators on thousands of farms and dairies, where day after day they save the farmer time and money. If wanting a cream separator, you cannot afford to be without a catalog of the Vermont Farm Machine Company, Bellows Falls, Vt., which explains the efficiency and construction of United States separators. Write for this catalog today and look it over at your leisure. Please mention this paper when writing. See advertisement on page 18.—Adv.

Guernsey Cattle Breeders—Attention.

THE banner sale of Guernsey cattle to be held in the western part of Wisconsin will be held at West Salem, Wednesday, May 3d, at which time sixty head of imported and American-bred cattle will be sold at public auction. Mr. Alfred I. Stubbs, of West Salem, Wis., has maintained a large herd of Guernseys, but does not wish to keep so many in the future, consequently he is consigning some of his best females as well as bulls, to this sale. Rundell Brothers, have farms at Hammond and Roberts, Wisconsin, and the cattle they are selling are choice throughout. There will be several cows in the sale that have large A. R. records, also daughters and sons out of A. R. cows. Imported Holden 4th 12179 is the sire of the present world's record two-year-old Guernsey heifer and the fact that he is the sire of some of the animals in the offering, should prove an attraction for anyone wanting the best. Bob Rilma 16141 the only son of May Rilma, until recently the world's record cow, is the sire of some of the individuals to be sold. The get of such bulls as imported Holden 4th, Bob Rilma, Langwater Princeling, Masher 63d and others, should be in demand by critical buyers. The offering will consist of cows that are in milk, cows and heifers that will soon freshen, breeding bulls and calves. Remember the fact, that there will be twenty cows safe in calves to imported Holden 4th. All stock has been tuberculin tested, and can be shipped to any point. West Salem is the first station west of La Crosse on the C., M. & St. P. and the C. & N. W. and the railroad connections are the very best from either direction. The catalogs are now ready, a postal will get you one. Write A. J. Hyzer, sales manager, West Salem, Wis., and in so doing kindly mention The Wisconsin Farmer. See page 29.—Adv.

Jersey Bulls for Sale.

JERSEYS have made good for Fred Stubley, Black Earth, Wis., and they will make good for you. He has one of the good herds of the state of Wisconsin and few herds contain better bred individuals. His herd is made up of about 100 head, twenty of which are imported cows. Imported Noble of Oakland was one of the greatest bulls the breed has ever produced and the breeder that has been fortunate enough to get one of his sons has been able to forge ahead. Mr. stubley had one of these sons that he called Noble of Avaranch and the get of this bull has made good in this herd. Another bull that has sired some wonderful females as well as herd bulls is Golden Maid's Viscount by Imp. Golden Maid's Prince, a bull that is known wherever Jerseys are raised. Bulls of serviceable age are being offered for sale at this time and several of them come from the above line of breeding. For their dams they have cows with advanced registry backing. You get the best when you buy Jerseys from the Stubley herd. Write him for further information and in so doing please mention this paper. See page 31.—Adv.

Piano Player Offer.

A GREAT many of our readers have thought that they would some day get a piano player. These readers will be interested in the announcement of the Story & Clark Piano Co., 86 Wisconsin street, Milwaukee, Wis., which appears on page 32 of this issue. This special offer appears to be very attractive and worthy the attention of anyone who is interested either in a player piano or a piano. The Story & Clark Company is a reliable concern which has been dealing in pianos and organs for many years and most of the readers of this paper are acquainted with them. Those who do not have the cash at hand to pay all down on a player piano or piano may arrange for small monthly payments and yet have the use of the instrument all the time it is being paid for. The free trial coupon in their advertisement places those who write under no obligation to purchase unless they wish to do so. We ask that those who write answering the Story & Clark advertisement be kind enough to mention The Wisconsin Farmer in their letter.—Adv.

Registered Holstein Heifers for Sale.

ADAM LORENZ, Sheboygan Falls, Wis., is offering ten registered Holstein females for sale on page 31. He also offers a few registered cows and young bulls. Our readers who are in the market for Holsteins can do no better than by writing to this breeder.—Adv.

Two Young Holstein Bulls for Sale.

D. W. EMERSON, Ashland, Wis., has for sale two young registered Holstein bulls at $110 each, f. o. b. cars, Ashland, Wis. These bulls were born in August, 1915; weigh about 700 pounds each, and are ready for service. They are descendants of Berl Wayne Paul De Kol and Bell Korndyke, butter 25.77, and are nicely marked, bout half white and half black. See the advertisement on page 29 and kindly mention The Wisconsin Farmer in writing Mr. Emerson.—Adv.

Berg's Holstein Consignment.

BENJ. F. BERG, Lake Mills, Wis., is one of Wisconsin's most progressive Holstein breeders. This has again been recently demonstrated by the official records which his cows have made. Mr. Berg is a discriminating judge of good cattle and a student of pedigrees. He has selected his breeding stock for both good ancestry, high production ability and good dairy type. He has consigned four head of choice animals to the Wisconsin Breeders' Sale at Watertown, Wis., to be held May 4th and 5th. One of these is the son of the thirty-pound cow, Lady Oak 2d De Kol. She just completed her thirty-pound record on April 5th. She is a daughter of Homestead Jr. De Kol the noted bull that has sixty-nine A. R. O. daughters, seven of which now have records ranging from thirty to 35.55 pounds of butter in seven days. Her dam is the great foundation cow, Lady Oak, which now has three A. R. O. daughters with records from thirty to 31.54 pounds butter in seven days, and one of the few cows of the breed to have three thirty-pound daughters. Lady Oak 2d De Kol will be kept on yearly test and a high record is looked for. The sire of the thirty-pound bull to be offered for sale is Canary Fobes Helena De Kol, the fine sire at the head of Mr. Berg's herd. He is a son of the thirty-five-pound bull, Canary Paul Fobes Homestead, a son of the great bull, Canary Paul, and the thirty-five-pound cow, Jessie Fobes Bessie Homestead. The dam of Canary Fobes Helena De Kol is a twenty-six-pound daughter of Fobes Tritomia Mutual De Kol, which has thirty-four A. R. O. daughters, five with records from thirty to 36.44 pounds butter in seven days. Mr. Berg has also consigned a fifteen-pound two-year-old daughter and a yearling daughter of Canary Fobes Helena De Kol. There will also be sold a bull calf out of the fifteen-pound two-year-old heifer. This calf was sired by King Segis Pontiac Alcartra, that is 100 per cent the same breeding as the $50,000 bull, King Segis Pontiac Alcartra. We advise our readers to attend this sale and look over these good animals. See page 29.—Adv.

Three Thousand Owners Praise the Inter-State Car.

THE Inter-State motor car at $850 has definitely proved that it has power to meet all emergencies, comfort to satisfy all requirements and beauty to please the most artistic. More than 3,000 Inter-State owners can testify to the truth of this statement. They have driven their cars under all conditions of every day use and find the Inter-State equal to all emergencies. Full motor satisfaction is found in the overhead valve type, four-cylinder Inter-State motor with removable cylinder heads, three and one-half inch bore and five-inch stroke. The carburetor has an automatic float feed and is very economical in fuel consumption. The body of the car is built as a five-passenger or as a roadster, with deep cowl, extra wide doors, wide seats and genuine leather upholstery. Each car is provided with an electric starting and lighting system and complete equipment. If you want to buy a car, be sure to write for catalog and literature of the Inter-State, advertised on page 15. Address the Fowler Motor Sales Co., 447 Jackson St., Milwaukee, Wis.—Adv.

A Free Watch With Each Trial Shipment of Stock Tonic.

A VERY liberal offer to farmers and stock raisers may be found on page 7 in the advertisement of Wilbur's Stock Tonic. In order to increase the use of this useful stock tonic, E. B. Marshall, president of Wilbur Stock Food Co., Milwaukee, Wis., will give a New York Standard Watch to each of the first 1,000 readers of The Wisconsin Farmer who will send for a trial feeding of Wilbur's Stock Tonic. If the tonic does not fatten live stock, rid them of worms and put them in the pink of condition, there will be no charge for the tonic, and the watch may be kept to pay for your trouble. This watch would cost from $6 to $8 in any store. If you are interested in this liberal offer, read carefully the advertisement mentioned above and fill in and mail the coupon attached. Don't forget to mention The Wisconsin Farmer when you write.—Adv.

Red Polls for Sale.

IF interested in Red Polls, you will be interested in the herd owned by E. L. Bennett, Black Earth, Wis. Owing to lack of room he will sell a limited number of bred or open heifers and a few bulls around a year old. These females and bulls are in good condition, in fact far better than the average run of stock this spring. They will continue to do well on grass and there is no reason why they should not make money for the prospective purchaser. Mr. Bennett is quoting prices that will appeal to you. His cattle, individually are good and they come from the very choicest line of breeding. Communicate with him, it will pay you. Please mention this paper when writing. See page 30.—Adv.

Frank Iam's Offering.

MR. FRANK IAMS, of St. Paul, Neb., proposes to make a clean-up on his draft stallions and mares in the next thirty days. Concerning his offering he writes: Be a "wise business man." Take "Frank Iams' tip," that United States is on the "high brink" of a "horse famine." United States placed contracts for 10,000 horses last week for "war horses" for Mexico. Europe is buying 500 horses daily, and has bought of United States 1,000,000 horses now for "war." Prices are advancing. Three and four-year-old horses, and 25 per cent gray horses are being bought. A draft gelding sold at Chicago auction last week at $425. No horses will be imported in ten years. First-class registered draft stallions are extremely scarce, and not 50 per cent enough to do "the service of mares" for 1916. Frank Iams is "closing out" all his horses. (Must be sold at some price) and has "reduced prices" on all his "show and business stallions and mares' from $100 to $500 less than formerly on each stallion and mare, to made a "clean up" in next thirty days. Uncle Dudley:—Be a "live wire," get into the "easy money" making game of breeding "big Percherons and Belgians." Be a "self-starter." Don't wait for your neighbor to "pluck" the "big profits" from your "cherry tree." Pull out the "spark plug" this "year of war" is best time "in fifty years" to "coin money in horses." Time to buy "a new stallion" or "pair of mares" of "Iams." The year 1316 is the "mascot year" for "big profits' to stallioners and breeders of "full bloods" and "big drafters." The "early bird" gets the "big money." Buy a "through ticket" to "Iams' Town" and get choice of his imported and home-bred Percheron and Belgian stallions and mares. All in the "pink of condition." They include my 1915 "show herd" of Paris and Belgian winners. "Iams' kind" are "big, classy," "peaches and cream" drafters and the best bunch of "herd headers" and "business stallions' 'owned by one man. They are two to six years old, weight 1,800 to 2,400 pounds, 80 per cent blacks, 80 per cent "ton horses." —All at "bargain prices" and must be sold. I have all my "medal and state prize winners" and best and largest horses from my 1914 importation. Have a "choice, classy bunch" of "ho.se-bred" horses. "Real drafters," bought for "spot cash" and "first choice" from "best breeders." That make "Ikey boys" sit up and take notice. I guarantee to show you horses that you will wish to buy and choice of my stallions for $800 and $1,300 (bar four, a little higher) better than are being sold to "stock companies" for $4,000 each. One year's time at 7 per cent bankable or secured notes. One and two years' time at 6 per cent security, $100 less price for cash than time. "Grays" and "h.me-bred" stallions come $200 cheaper. My registered Percheron mares are "real drafters," three to six years old, weight 1,800 to 2,100 pounds, blacks and grays. In foal and broke to work, mares $800 and $1,000. These mares bring colts that sell for $500 at six months old. If you visit me, and do not find every statement in "advertisement or catalog" true, I will pay you $500. I pay freight of horse and fare of one buyer both ways. Give breeding guarantee of 60 per cent, (backed by $500,000). I can place $1,500 insurance. Iams' imported stallions and mares are registered, approved, "branded," "inspected" and pedigrees stamped O. K. by governments of United States and France. Also inspected by a Nebraska deupty veterinarian and a certificate of "health and soundness" given with each horse. "Special prices" made at barns only. "Reduced prices" on "show horses." Come and see Iams and "big black boys." My "new selling clothes" fit all buyers. I'll treat you "square" and "save you" $1,000. I sell horses. Come on along. Try "Iams" "dad", and write for his 1916 catalog and "eye-opener." See page 30.—Adv.

The One-Man Stump Puller.

FARMERS who have stump land can get some valuable suggestions on clearing same and getting it under cultivation in a cheap and efficient way, by sending for the Kirstin book on land clearing. This book tells how to pull stumps, trees, brush and hedge without the help of a force of men and horses. It explains the use of the one-man stump puller and how to operate it most efficiently. The one-man stump puller is designed on mechanical principles to multiply the force of one man so that mammoth stumps can be pulled by him. Send for this book today to A. J. Kirstin Co., Escanaba, Mich., and please mention The Wisconsin Farmer in your letter. See advertisement on page 10.—Adv.

Morley Co.—Short-horns and Percherons.

DO you need a Short-horn bull whose dams are heavy milkers, if so write R. A. Morley Co., Baraboo, Wis. They are offering several good young bulls at prices that are attractive. In Percherons, they have a few young stallions, sound and right in every way, and, as they wish to dispose of them this spring, they are making prices far be-

low their value. Write the above firm at once and mention The Wisconsin-Farmer. See page 30.—Adv.

Chippewa Stock Farm.

THE writer recently spent the day with L. P. Martiny, Chippewa Falls, Wis., and found him to be the owner of one of the most modern and up-to-date breeding establishments that we have visited in the state. We don't know whether Mr. Martiny is a "progressive" in politics, but he is indeed progressive in his live stock and farming operations. Chippewa Stock Farm consists of 320 acres, located about five miles from the above town. This is an ideal stock farm, there being 200 acres of level farming land, as good as any man would wish to own—120 acres is used for pasture and hay land and through this good grazing land runs a small creek that furnishes fresh water for the stock the year around. His cattle barn, horse barn and hog barn are as modern as they can be made. Guernsey cattle, Poland China hogs and Percheron horses represent the breeds of live stock raised on the place. The Guernsey herd is one of the best, though not the largest, in the state. Heading the herd is Stranford's Glenwood of Pinehurst 6th he by Stranford's Glenwood of Pinehurst that has nine A. R. daughters. His dam, Selma of Pinehurst 4th has a two-year-old record of 485 pounds of fat and was the first cow of the breed to make five A. R. records. This bull is a double grandson of the noted Glenwood Bo of Haddon. One of his sons was first and junior champion at Minnesota State Fair, also at the Wisconsin State Fair, last year. The junior herd bull is Dasher of Sarina by Selma's Glenwood. The sire of this bull and the dam of the first mentioned bull are full brother and sister. Mr. Martiny's herd is rich in Glenwood breeding. Perhaps the owner is better known as a Poland China man, owing to the fact that he has been showing his hogs at state fairs for the past fifteen years. One hundred spring pigs represent this year's crop and they are a fine, thrifty bunch of "rooters." The blood of several noted boars runs through the veins of these pigs. There are some litters out of daughters of Smooth Big Bone sired by Black Big Bone 2d, both grand champion boars of Iowa. Litters by Mollie Jones Lad he a son of Big Tom the 1914 Minnesota grand champion. Some are by Chief price he by the noted Chief Price Again and out of Pawnee Lady 5th, one of the greatest brood sows ever owned in Iowa. Daughters of the great boar, Repeater and Black Jumbo have litters sired by High Wonder, a good son of Long Wonder 2d. Big Tom is a grand champion of Nebraska and a daughter of his has a litter by Long King he by Iowa King a boar known wherever Polands are raised. This does not cover all the fashionable breeding in this herd, we simply mention it to show the character of the blood lines. What took our eye was a September boar sired by Golden Gate King. This is an excellent boar of his age—great length, a high back the best of feet and an ideal head and ear. The pig has never been pushed, but has plenty of size now for his age. We are in hopes Mr. Martiny will fit him for the fall shows, but he wishes to use him quite heavily and after the spring service it isn't likely he can get him in condition for the fairs. His sire, Golden Gate King, is owned by Henry Dorr, Remsen, Iowa, and he considers him the best boar he ever owned—and he has owned some of the best. At the present time Mr. Martiny is offering fall boars for sale. They are in nice condition and there are several in the lot that are good herd-boar prospects. This is going to be a good year to raise hogs, and, of course, no one should use anything but a pure-bred boar and these boars will suit you. Get his prices and place your order at once, for naturally the first buyers get the pick of the lot. Keep this herd in mind for it is without a doubt one of the best Poland herds in the state. They are big type, yet they have that quality that many of the big-type hogs fail to have. Write your wants and in so doing kindly mention the fact that you saw the advertisement in The Wisconsin Farmer. See page 30.—Adv.

Red Poll Bargains.

WITH this issue of Wisconsin Farmer Natt Kimball, Black River Falls, Wis., starts his advertisement calling attention to the Red Polled bulls he has for sale. Mr. Kimball is not the largest breeder in the state, but he maintains a few select cows, and keeps the females in his herd, selling only the bulls. In this way he has built up a herd of uniform type and knows just what to expect from the families represented in the herd. At this time he has for sale, one yearling and one two-year-old bull. Mr. Kimball is a good farmer, feeder and business man and when one finds a good, up-to-date farmer, he generally finds stock in a healthy, thrifty condition. His cattle are in good condition and the two bulls being offered for sale are ready to go into service and continue to do well. There is a growing demand for Red Poll cattle and if you are interested in this breed communicate with Mr. Kimball at once. In writing please mention The Wisconsin Farmer. See page 30.—Adv.

Reduce Feeding Costs.

THOUSANDS of farmers are reducing their feeding costs, saving time, labor and power and getting greater silo tonnage with Smalley machines. You can learn how they do it. Simply get the illustrated free book of the Smalley Manufacturing Co., Manitowoc, Wis. This company makes silage and milling machines of a very high grade, which are designed for long, hard service. Send for the book mentioned in the advertisement on page 26 and learn how these machines are used to reduce feeding costs and utilize products that are now going to waste on the farm. The information may mean greater profits for you. Kindly refer to this paper when you write.—Adv.

Salter & Sons' Red Polls.

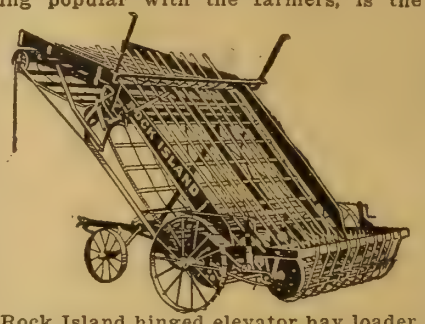
J. W. SALTER, Unity, Wis., belongs to the pioneer class of Red Poll breeders in the state. He moved from Madison to Unity thirty-five years ago and for thirty years, he has been breeding Red Polled cattle. The first animal he purchased was a Red Polled bull to use on his grade cows, this cross improved his grades so much, in both beef and milk, that he took a liking to the breed and purchased some registered cows from the then popular breeder, E. W. Keys, Madison. The first cow was Tonywatha Belle 11891 by Juda 1889, out of Hecuba 3499. This original cow proved to be an excellent breeding matron and she was useful until she died at the age of almost twenty years. Tonywatha Belle formed the nucleus for the present herd of some forty head and it goes without saying that this must be a good family or Mr. Salter would not have staid with it. Such bulls as Prince Bismarck 12073 by Hobson 8239 and Prince 21188 by Senator have been used with good success. The present herd bull came from the noted Martin herd and is sired by Luna Lad 18th 22074 out of Poe 34714. Recently Mr. Stalter took his sons into partnership and the excellent appearance of the herd is due to the untiring efforts of Ted Salter. He is an enthusiastic cattle man and having been brought up with the Red Polled cattle he is well versed on this breed. At the present time they have two bulls for sale—both dark red, and one of them, about fifteen months old, is a very choice individual. He has an excellent head and neck, good top line, fine spring of rib, in fact he is suitable to head a pure-bred herd, and the price is very reasonable. There are some excellent milkers in this herd and the owners expect to begin testing this coming summer. Keep this herd in mind and if you need a bull it will pay you to do some corresponding. In writing please mention The Wiscoinsin Farmer. See page 29.—Adv.

Bargains in Stallions.

IF you are going to buy a stallion to use and put on the stand for the coming season, it is time you was making your selection. We are glad to recommend the stallions being offered by Thos. McNamara, Bloomington, Wis. He has four Percherons and one imported Belgian stallion and inasmuch as these horses have been used in the stud and have made good, you are taking no chances in buying a non-breeder. A good guarantee is given with each horse and the prices asked are very conservative. His horses have size with quality and are sound. It will pay you to investigate. Write at once and mention The Wisconsin Farmer. See page 30.—Adv.

The Latest Improvement in Hay Loaders.

ONE of the latest improvements in the hay tool line, that is rapidly becoming popular with the farmers, is the



Rock Island hinged elevator hay loader. The most prominent feature of this loader is the jointed elevator, which carries the hay well over the wagon and makes loading many times easier. As the wagon becomes loaded the elevator is gradually raised, so that the hay is always dropped just where it is wanted. The return elevator is out of the way and cannot drag hay off the load, and there is no danger of the wind blowing the hay away, as it is being delivered from the loader. Loading the wagon is made easy with the Rock Island hinged elevator loader. A solid steel frame with steel bracing and steel construction underneath gives this loader strength and durability equal to any loader made. This tool is made by the Rock Island Plow Company, Rock Island, Ill., who have a recognized high standing in the implement field. They make a full line of high-grade farm tools which are fully described in their book "Rock Island Farm Tools." We would advise our readers to send for this book, as it is a very valuable source of information on the subject. Even if you are not ready to buy just at present, you should have the book for reference. Simply write to the company for it and mention this paper in your letter.—Adv.

Milwaukee Separator is Easy to Clean and Operate.

THE Sanitary Milwaukee cream separator gets all the cream. This, of course, is the first point in its favor. But another very important point is the simple construction and small number of disks, which make this machine very easy to clean and operate. The discs are made of aluminum, from which grease and impurities are easily removed, and they need not be kept in numbered rotation or put on a wire holder when taken off the bowl core. Before you buy a separator write for a catalog of the Sanitary Milwaukee and learn how this machine will save you time and work. Address Milwaukee Separator Mfg. Co., Milwaukee, Wis., and please mention this paper when you write. See page 18.—Adv.

Hoesly's Holsteins.

BALTZ HOESLY, New Glarus, Wis., is offering a few cracking good young bulls for sale at the present time. These are sons of the thirty-two-pound bull, Colantha De Kol Pietertje, one of the best sires in the middle West. His dam is Ida De Kol Pauline, that made 30.64 pounds of butter in seven days. His sire is Colantha Johanna Lad, a son of the great cow, Colantha 4th Johanna. He has ninety-nine A. R. O. daughters, six with records from thirty to thirty-four pounds of butter in seven days. The bulls offered for sale are out of well-bred, heavy-producing cows. Send for pedigrees and prices of these fine young bulls. See page 31.—Adv.

Delicious Gunz-Durler Chocolates.

GUNZ-DURLER chocolates can always be depended on for delicious taste and absolute purity. The thick, velvety, chocolate coating and the variety of tantalizing flavors make these chocolates distinctive. If you give them one trial, you will be an enthusiast. Get a box today, or if your local candy dealer does not have them, write to Gunz-Durler Candy Co., Oshkosh, Wis. The boxes are in different sizes at prices of 50, 60, 80 cents and $1. See advertisement on page 22.—Adv.

Trade in Your Old Separator on Liberal Terms.

ANYONE having a cream separator that is not giving entire satisfaction can turn it in as part payment on

MODELS of imported and home-bred stallions and mares offered by Mr. Frank Iams, St. Paul, Neb. Prices have been reduced from $100 to $500 per animal. Everything mustbe sold within thirty days—hence the bargains. See advertisement on page 30.

30 miles up river from Dubuque

one of the best cream separators on the market. This offer is being made for a limited time only by the Rock Island Plow Co., Rock Island, Ill., on their Great Western separators advertised on page 19. If you have an old separator, this company will allow you a good price for it and for a small cost you can get the Great Western separator. This machine is built with a low-down tank, high crank and perfect flushing bowl, which make the work of operating and cleaning as light as possible. You should take advantage of this offer while it lasts. Write to the Rock Island Plow Co., specifying the size of separator you want, and they will make you a liberal proposition.—Adv.

REGISTERED Holstein cows, heifers and young bulls are offered at very reasonable prices by Kirkpatrick Bros., Reedsburg, Wis. They have one of the good herds of the state, headed by a grandson of the great bull, King of the Pontiacs. See their advertisement on page 31.—Adv.

IMPORTERS AND BREEDERS OF

PERCHERON, BELGIAN AND CLYDESDALE STALLIONS AND MARES

STALLION BUYERS ATTENTION. For the next thirty days we are going to reduce our prices on all of our big young stallions in order to close them out. We have a very large bunch of big ton, rugged stallions running in ages from two to six years that must be sold this season, consequently anyone that is looking for a right good one will save money by writing to us and getting our prices and descriptions before buying. We especially have a very strong collection of Belgian stallions, in weight from a ton to 2,300 pounds, from two to five years old, that should be on some good farms the coming season. We also have ten tried sires, Percherons and Belgians, that we have taken in on trade on younger stallions, that we are offering very reasonable.

We are located in north central Iowa on the C. M. & St. P. R. R., midway between Mason City and North McGregor, Iowa. Send 20c in stamps for large horse calendar which shows our main farm and sales stables. Correspondence a pleasure.

FRANK P. SHEKLETON & SONS, LAWLER, CHICKASAW CO., IOWA

POLAND CHINA SWINE.

Martiny's Poland China Boars

15 FALL boars of September farrow, sired by Wisconsin Jumbo, the 1st prize and Jr. champion boar at the Wisconsin State Fair, 1914. I believe he was the biggest boar of his age shown that year, he weighing 510 pounds at eleven months old. This will be the last chance to get a herd header from this great boar. The wise man will raise a few fall pigs this year if he never did before. I will sell these boars now for less than they will bring for pork after you get through using them next fall, as I wish to make room for my 100 spring pigs I already have on hand.

FRANK IAMS'

Iams owns the three largest and best 2, 3 and 5-year-old Percheron Stallions in U. S. weight 2,100, 2,230 and 2,410 lbs., all "Paris and Gold Medal Winners." Iams owns "Dentist," "champion" double "Gold Medal" winning Percheron 3-year-old. Try Iams—"Dad." His Belgians are 'Eye-Openers." We take no chances. He sells horses "On honor" and all his horses will be sold at some price.

Is "closing-out" and has "reduced prices" on all his "Show and Business Stallions and Mares"—from $100 to $500 less than formerly on each stallion or mare—to make a quick "clean-up." He has all his largest and best horses—many "Big Snaps"—"Mr. Buyer. Be a "Self-Starter." 1916 is the "Get-Rich-Quick" year for "Up-To-Snuff" Horse Breeders—Pull the "Spark-Plug"—Plunge into the "Easy-Money Game"—Buy a stallion and a pair of mares of Iams—His "Big Horses" and "Cut Prices" are the "Town Talk." His 34 years of success in importing, breeding and selling 5575 registered horses, his "fifty trips" across the ocean—makes Iams a safe man to buy stallions from. His "old customers" are "best Page advertisers," his Breeding guarantee backed by "½ Million Dollars." Iams' Imported and Home-bred horses are "classy, model drafters" of big size, large bone, fine form, quality and finish. Many

"Gold Medal and State Prize-Winners,"

"Iams' Kind," and in the "Pink of condition." Bought at "Bargain Prices," and must be sold. Iams sells horses on Honor. A lady can buy as cheap as a man. Is not in the "Stallion Trust," and is selling more pounds of "Model Draft Horse" for the money than any competitor. Iams is cutting the middle out of high prices on his choice collection

OF PERCHERON AND BELGIAN STALLIONS AND MARES

2 to 6 years old, wt. 1,800 to 2,410 pounds, all "Branded," "Approved," "Registered" and "Inspected" by Governments of France and U. S., and certificates stamped "O. K." All "Inspected" by a Nebr. Deputy State Veterinarian, and certificates of "Health and Soundness" are given with each horse.

REGISTERED STALLIONS AT $800.00 AND $1,300.00

(Four little higher.) "Home-Breds" come cheapest. Terms cash, or one year's time at 7 per cent: land security at 6 per cent; $100 less price for cash than time. Iams pays freight and buyer's fare; gives 60 per cent breeding guarantee. Can place $1,500 insurance. Iams backs up his ads with $500 guarantee that you find the horses as represented. Write for Horse Catalog. It has a "Big Bargain" on each page. References: First National and Omaha National Banks, Omaha, Neb., all St. Paul Banks, St. Paul, Neb.

ST. PAUL, NEB.

We Want You To Try A Piano or Player in Your Home FREE!

Here is the most unusual and liberal offer ever made by a piano manufacturer at any time anywhere! Our firm belie in the superiority of our instruments prompts us to make it. Our factory-to-home selling plan eliminates the middleman's profit. This profit consists of dealer's, agent's, or teacher's commissions. To the cost of manufacturing, we add a legitimate profit and our great factories are constantly busy because shrewd buyers can readily see where our method saves them a lot of money. For a limited time we offer readers of The Wisconsin Farmer an opportunity to try in their own home a piano or piano player, thus affording them a chance to study every phase of the instrument, and thoroughly satisfy themselves o the soundness, tone superiority and general character of the instrument before they purchase. There are no "ifs," "ands" or "buts" about this offer. You are the judge! You decide for yourself whether or not you want the piano or player—if you say "YES," we're happy! If you decide "NO," we'll take it back without question or quibble and pay all the cost of freight, etc.

What could be fairer? What more liberal? The only requirement is **prompt action, as this offer will not appear again.** Take Old Father Time by the forelock and mail the coupon now while the impulse is waiting to be obeyed.

The Player, Bench, Cabinet and 36 Rolls of Music (as pictured)

You owe it to yourself to see this wonderful Player Piano. It will be a surprise to the most critical music lover. The player action is a marvel of mechanical ingenuity, repeating with the greatest freedom even when peddling very lightly. In ease of operation it surpasses many of the highest priced player pianos. Story & Clark's "Factory-to-Home" method saves you $248—as most dealers would ask $550 for this very player.

The ironclad guarantee of a $1,000,000 factory is back of the instrument. Try it in your own home Free. Convince yourself—then pay for it in small monthly payments. **Your banker will tell you of our reliability.** State whether you prefer walnut, oak or mahogany finish.

$302

FREE MUSIC!

Every purchaser of a player piano has the privilege of exchanging rolls of music without charge. Our Mail Order department will send you lists of the latest numbers of Standard Music Rolls.

Guaranteed For Ten Years!

SEND NO MONEY

Our offer of a Free trial is bona fide! We want to thoroughly satisfy you before you purchase. All the charges of freight, etc., are paid by us. The instrument will be cased with the utmost care, and we will stand the responsibility of its safe arrival. You take no risk whatsoever.

MAIL THE COUPON

This Beautiful Piano and Bench to Match

is of sufficient beauty to grace any home. The beautiful, sweet tone of this instrument is its best recommendation. The reason is simple. It's the SOUNDING BOARD—the pulse of a piano. We could tell you a lot about its construction, etc., wherein it excels other far higher-priced pianos, but we prefer to show you.

Dealers would ask $350 for this self-same instrument. Our liberal selling method enables us to offer it at this low price on small monthly payments. Try it in your own home—you'll be convinced. In sending the coupon mention whether you prefer oak, mahogany or walnut finish.

$179

SMALL MONTHLY PAYMENTS

Besides the attraction of our factory price, we offer to sell our instruments on easy terms—payments to fit your purse. This offer also holds good on any piano or player listed in our beautiful art catalog which will be sent on request. It costs no more to own our famous-made players or piano than one of inferior make. Let us prove it. Mail the coupon!

Mogul and Titan Engines

TWENTY **Titan** engines of all sizes, all kerosene burners, were lined up in front of the I H C dealer's store at Litchfield, Minn., one day last summer. That day their new owners took them out to supply good, reliable power on twenty farms. A few months later Litchfield saw twenty more farmers take **Titan** engines out to their farms.

Two big **I H C** engine delivery days in that town last year. In many hundreds of towns you will find this same popularity of **I H C Mogul** and **Titan** engines—the best farm power—Grand Prize winners at San Francisco.

You must have an engine—then buy an **International Harvester** engine—**Mogul** or **Titan**. It will keep down your fuel and repair bills, deliver the most power with least trouble, and save you more hard work than you can realize now.

International Harvester engines are made in all approved styles, sizes from 1 to 50-horse power, operating on low as well as high-grade fuels. Some local dealer near you handles **Mogul** or **Titan** engines. If you don't know him, drop us a line. We'll send you full information, and make it easy for you to get the best farm engine made.

CURRENT EVENTS

PRESIDENT WILSON issued an ultimatum to Germany last week which brings the question of submarine warfare, as waged by the Teutonic powers, to a crisis. The president plainly informed Germany that if the present methods are not amended it would be necessary for him to break off all diplomatic relations with that country, an act which with but one single exception has always been followed by a declaration of war. The same day on which the kaiser's government received this latest note the president went before congress, in joint session, and explained his stand, not asking congress to back him up, but simply to keep all branches of the government informed as to the situation. In his speech to congress the president said: "I have deemed it my duty to say to the imperial German government that if it is still its purpose to prosecute relentless and indiscriminate warfare * * * the government of the United States is at last forced to the conclusion that there is but one course it can pursue; and that unless the imperial German government should now declare and effect abandonment of its present methods of warfare against passenger and freight carrying vessels this government can have no choice but to sever diplomatic relations altogether." In his note to Berlin the president did not mince words, but plainly stated that the submarine warfare, as now carried on, is "utterly incompatible with the principles of humanity, the long-established and incontrovertible rights of neutrals and the sacred immunities of noncombatants." The German government is expected to answer the note promptly. In the meantime, most of the leaders in congress are standing solidly back of the president, although Congressman Mann, of Illinois, republican leader of the lower house, is quoted as saying that "it is perfectly evident that the president, as a campaign political dodge, is trying to work up to a point where he can get into a war with Germany during a presidential campaign." Few public men have expressed themselves in such an unpatriotic manner, the stand of Senator Lodge, of Massachusetts, one of the republican leaders, being in marked contrast. Senator Lodge said: "I think the president could not possibly have done less in the circumstances. He has made a very clear case of Germany's case and policies of submarine warfare and the rights of ships carrying neutrals and noncombatants." "If war comes out of this," declared Senator Kenyon, republican, of Iowa, "I hope the first to enlist will be those who have insisted on riding on armed belligerent ships." The situation between the two countries is the most strained and serious it has ever been, with no man able to foretell what the ultimate outcome will be.

AN ARMY reorganization bill that would produce regular army and reserve military forces in the United States aggregating 1,000,000 men was passed by the senate without a record vote. It is a substitute for the Hay bill passed by the house and goes much further than that measure in increasing the military strength and resources of the nation. In the closing hours of debate the senate made provision for a regular standing army with a peace strength of 250,000 men, as compared with 140,000 in the Hay bill, retained after a close fight the plan for a federal volunteer army reserve force calculated 261,000 men, and federalized the national guard forces of the states at an estimated strength of 280,000 men. In addition to this combined regular and reserve force of 790,000 men, an amendment was passed to create a school and college youths' reserve corps in time of war or threatened war which would recruit a force of trained young men, schooled by officers of the regular army, the estimated strength of which is put at anywhere from 200,000 to 400,000. The differences between the senate and house bills will be worked out in conference, the probable result being a greatly increased army, especially in view of the grave international situation in which the nation now finds itself.

SERIOUS charges were preferred against the national guard of the various states by Senator Borah, republican, of Idaho, in the course of a speech in the senate last week. He asserted that the $8,000,000 a year now appropriated by the government for the national guard was "shamefully wasted" and some of it "embezzled." He denounced the efforts of some of the senators to strengthen the guard, instead of the regular army, and said they were merely playing politics in order to "stand in" with the guard leaders in their states. He continued: "The way the officers of the national guard have been utilizing the federal fund to themselves to the exclusion of enlisted men is perfectly shameful and cannot be defended except for political exigency. In this bill you are not preparing for war. You are not giving the people what they are expecting to pay for. We are filling this bill up from beginning to end with purely political appropriations and you couldn't proceed a step under the guise of national preparedness." The national guard has come in for a lot of discussion at this session of congress, inasmuch as it has been maintaining a lobby at Washington in its interests and going into politics deeper than ever before. It is extremely doubtful if congress will take any radical action, for the guard has too much political strength, but there is a growing conviction that the state troops are not measuring up to the standard which should be demanded of them.

AGITATION for a greater navy at the expense of army increases was begun in congress last week, Senator Stone, of Missouri, and Senator Borah, of Idaho, being the leaders. Senator Stone, who is chairman of the foreign relations committee, made a plea for a navy big enough to fight offensively on the high seas anywhere in the world and Senator Borah, on the republican side, urged that proposed army increases be sacrificed in order to strengthen the navy. While he deplored any program that could be construed as either navalism or militarism in the United States, the Missouri senator said he was for adequate defense and thought the navy was by far more important than the army. Both Senators Stone and Borah advocated a reasonable standing army. When asked if they thought the United States had an adequate force in case "unpleasantness" should follow developments in Mexico, the former said he thought an adequate force speedily could be procured for an emergency. Senator Borah was emphatic in his championship of the navy, not only as the first line of national defense but also as the last line of defense. With a strong navy it is argued the United States is free from the perils of invasion, just as England is successful in keeping its enemies away from its shores, save by one route: the air.

GEORGE W. PECK, former governor of Wisconsin for two terms and one time mayor of Milwaukee, died at his home in Milwaukee last week, at the age of seventy-five years. Governor Peck was as well known for his writings as for his political achievements, he being the author of the widely read "Peck's Bad Boy" series, the best-known works being "Peck's Bad Boy and His Pa," "The Groceryman and Peck's Bad Boy," "Peck's Bad Boy With the Circus" and "Peck's Bad Boy With the Cowboys." Peck was one of three democrats who since the admission of Wisconsin to the Union in 1848, held the position of governor. He was governor from 1890 to 1895. In 1892 his opponent on the republican ticket was former United States Senator John C. Spooner, whom he defeated.

FAMILY CIRCLE TALKS
BY THE PUBLISHER

FARMERS AS HEROES.

THROUGH the kindness of the secretary of the Carnegie Hero Fund Commission I have been furnished with a copy of the report of that body for 1915. I am delighted to learn that farming continues to provide the most American heroes, no other calling or profession coming near to supplying so large a number of people who put all selfish thoughts out of their heads and risked their lives to save their fellow beings. "Greater love hath no man than this, that a man lay down his life for his friends." The most peaceful profession in the world, farming, has furnished the world with its most heroes.

A few minutes' study of the 1915 report of the Carnegie Hero Fund Commission has shown me that during the past year medals were awarded to twenty-two farmers. The count for those professions which, by their daily hazards, might be expected to furnish the most heroes, is as follows: Followers of the sea, eight; railroad men, fourteen. In short, as many men were decorated by the commission from the fields of agriculture as from those who follow the sea and from those who work upon the railroads of the land put together. One-sixth of all those whose exploits the Carnegie commission decided were worthy of recognition followed the peaceful profession of tilling the soil and bringing crops through to harvest.

The record is a splendid one. By turning to the back reports, which I have on hand here in my office, I find that in the eleven years Mr. Carnegie has been decorating men and women of heroic mold, no less than 1,145 awards have been made, of which 111 were to farmers, while only fifty-five were to sailors, fishermen and those who follow the sea for a living, sixty-five to miners (whose calling is one of the most hazardous) and ninety-two to railroad men, who are daily surrounded by dangers. The supremacy of the farmer in the display of heroic talents is unquestioned.

I imagine that this summarizing of the professions which furnish our national heroes of peace will be a surprise to a great many people. Farming is classified as a peaceful profession, the risks of which are not comparable to those of many of the professions of the city. Yet in the quiet solitude in which the farmer works, much of his day, there are born heroic impulses which, in the emergency, find expression in heroic deeds in a twinkling, without thought of the great personal cost at which these deeds are performed. When some great sculptor comes to give to the world the figure of the typical American—independent in thought, heroic in mold, great in everything that goes to make our country deservedly prosperous—what better figure could he possibly choose than the sower or the plowman going about his peaceful yet heroic task, a veritable warrior in the fertile fields of peace?

A HELPFUL FARM WIFE.

I WISH it were possible to publish all the interesting letters I receive. They cover such a variety of subjects; they reveal the writers' minds and hearts so intimately. Opening the day's mail is as much a treat to me as anything in my life; it puts me in such intimate, heart-to-heart relationship with my readers. That is why I am always urging farmers to write to me, either for advice or instruction or just in a sociable, chatty spirit; the pleasure of receiving and reading their letters is a very great one, indeed.

Here, for instance, is a letter which not only gave me pleasure, but which should be an inspiration to all who read it, whether they live on the farm or not, for it shows what a determined person (man or woman) can do, once they put their mind to a thing resolutely. This letter is from a farm woman here in the grain belt:

I have decided to run an advertisement in your paper for a year. We are renters and last year were able to raise only a very small portion of our rent, and have had to buy feed for the stock all winter. I run my poultry business in my own name, and in spite of having to move occasionally, and with poor accommodations for poultry (except as we build or repair at our own expense) I clean up and disinfect, have the grounds plowed around all the buildings where poultry is kept, and for the past four years have made $250 a year above all my expenses on my chickens. Handling this business myself has given me a better business education than I could have gotten had it been in my husband's name, as I have attended to all the business details myself. The money, of course, goes where it is most needed, for a kitchen range, manure spreader, blacksmith bill, children's clothing, garden seed, seed corn, or whatever is most needed, but each year I buy for myself something to make my work easier. One year a kitchen cabinet, one year a dress form, or, if the year is extra hard, I content myself with only a bread mixer or a carpet sweeper, but each year I add some comfort for the home out of my chicken money. I enjoy these things better because I earn them myself. I have no expensive equipment, and what would be usually considered very poor accommodations, but I do my best with what I have and have made something of a success. I raise 500 chicks each year; from that number I pick out ninety to 100 of the very best for my breeding stock. Your paper helps me to sell the rest at a price that brings me a reasonable profit and satisfies my customers. I am getting orders for eggs just about as fast as I can fill them.

Here, certainly, is a letter full of cheery inspiration. I can picture to myself that happy, contented farm wife going about her daily work amid her humble surroundings, not knowing whether they will have to move again next year or not, but determined to do the best she can with the accommodations provided her. There is a heroism in such labor that should both shame and inspire us all; shame us who may have an easier lot in life, because we grumble for so little cause; inspire us all, whatever our lot, to do the very best that lies in us. What wonders we could accomplish, on the farm as in the city, if only we would live up to the very topnotch of our possibilities. If a tenant farmer's wife, with but meager accommodations, can keep up her courage so splendidly and work such wonders, shall we not all determine to keep apace of her and make our efforts yield still greater results?

I honor that farm wife and wish for her the greatest success possible. Helping her husband with her chicken money, and spending the little balance to the best advantage, so as to make her work easier and thus relieve herself of some of the burdensome cares and duties which might distract her and cause her to be a less inspiriting helpmate to her husband, she is building up the ideal American farm home, though they do not own a foot of land. All honor to a woman who can do so much with so little and be so cheery withal.

INTEREST IN FARM CLUBS.

THE response to my offer to do what I could to assist in the organization of farmers' neighborhood clubs has been far greater than I ever anticipated. I am delighted with the prospect. If the number of requests for constitutions and by-laws is any indication—and I believe it is—there will be several hundred more of these clubs started within the next few weeks. I have had what I consider a model draft of the necessary constitution and by-laws printed in a neat little four-page circular and I am sending these to all who request it, being only too glad to be of this little assistance. If you have not already written for one of these circulars, and want one, let me know at once.

I cannot refrain from quoting a few brief extracts from some of the letters already received. They are characteristic of the great interest manifest throughout the entire grain belt:

"I would be pleased to receive any information regarding the organization of a neighborhood club of young people from fifteen to twenty-five years of age, some with musical talents, but none of us have much of a talent to lead. We have quite a number of Catholic boys and girls who would be considered in an organization of this kind. Any help you can render will be greatly appreciated."

"I have read your paper for three years and like it better every week. I read in last week's issue that you offer to help any neighborhood club in the way of giving instructions. In our neighborhood here we have just organized a club, of which I am president, and I feel that I need the information that you so kindly offer."

"We are organizing a community club here and expect to build a community house this summer. We would be glad if you will please send us a model draft of constitution and by-laws as you offered."

"We have in our county some twenty local farm clubs, but have plans under way whereby one central organization may be perfected with these clubs as units. The purpose would be to better marketing and buying conditions, as well as social advantages. On April 30th a committee of five meet to draw up constitution and by-laws. I write you seeking help in this matter and assure you any suggestions will be gratefully received."

I can only repeat: Nothing gives me greater pleasure than to receive letters such as these and to answer them to the best of my ability. Sometimes I cannot go as fully into particulars as I would like, for my mail brings hundreds of letters each day and all must be answered. But whenever I can be of any assistance I give it gladly, for that, I believe, is one of the provinces of a publisher: To aid his readers and patrons to get more out of life in every possible way. So I repeat the invitation: Write me for whatever advice or information you need; I will do the very best I can in reply.

THE COUNTRY IN SPRING-TIME.

I RAN across a little gem last night in my reading, and while I do not know to whom the credit of authorship belongs, I am going to pass it along to you so that we may all enjoy it together. It is entitled "The Country Boy's Creed," and is as follows:

I believe that the country which God made is more beautiful than the city which man made; the life out of doors and in touch with the earth is the natural life of man. I believe that work is work wherever I find it, but that work with Nature is more inspiring than work with the most intricate machinery. I believe that the dignity of labor depends not on what you do, but on how you do it; that opportunity comes to a boy on the farm as often as to a boy in the city, that life is larger and freer and happier on the farm than in the town, that my success depends not upon my location, but upon myself—not upon my dreams, but upon what I actually do; not upon luck, but upon pluck. I believe in working when you work, and in playing when you play, and in giving and demanding a square deal in every act of life.

My friends, that has the right ring; it puts the superiority of rural life into such words as we can all understand and subscribe to, such words as spur us on to do our part in making the country a still better place in which to live. The country boy who learns this creed by heart and says it to himself every little while is not going to be lured away to the city, with its heartaches and disappointments, but is going to stay by the old home place and make good. I wish something like this might be recited by one of the boys at every neighborhood club meeting, or wherever the community congregates to dedicate itself anew to making country life more enjoyable and soul-satisfying.

While I am passing the good things of print along to you I am going to set forth a poem which strikes a responsive chord in my breast at this springtime of another year, when the buds are giving promise of the fruit and all the world is on tiptoe with expectation. It is entitled "Spring's a-Comin'":

When the hens begin to cackle in a sort of frantic way,
An' the yellow-crusted eggs is strewed about upon the hay;
When the smoke's a-breezin' over from the bresh piles on the hill,
An' the turkey gobbler gobbles as he's struttin' with a will,
When the lambs is cuttin' capers while their mammies nip the grass,
An' the women is a-fixin' for to grow some garden sass,
When they're sortin' out the onions an' a-fixin' of the peas;
When a sort o' drone is comin' from the shanties of the bees;
When the mules is steppin' stately down across the stubble fields,
An' Aunt Dinah's pickin' sallet from the tops the turnips yields—
Why, the spring's a-comin' certain, from its home down yonder south,
An' a fellow keeps a-workin' with the whistle in his mouth.

When the jonquils is a-bloomin' up an' down the gravel walks;
When the hoes is whackin' steady, in the wheat fields cuttin' stalks;
When the pigeons play at lovin' at th' mossy stable roofs;
When the colts is gettin' frisky an' a-tryin' of their hoofs;
When the children's shoes is rusty with some windows at the toes,
An' a sort o' subtle sweetness whispers in the wind that blows;
When the hams is brown as walnuts, an' they're ready for the sacks,
An' the hay's a gettin' meager where it's wintered in the stacks;
When the peach buds is a-swellin' with a little glint o' green,
An' Milinda is a-stitchin' for to be a Easter queen—
Why, the spring's a-comin' certain, though it's maybe raw an' cold,
An' a fellow feels a youngster, though he knows he's gettin' old.

What difference do a few more years make if "a fellow feels a youngster," and isn't spring the time when youth is in the ascendancy and the years fall off our backs, like a peddler's pack loosed at the end of a day? I may be a bit sentimental, but a poem like this puts good spirits and renewed vitality into my veins for many a day. Some of the old-fashioned poems and songs, written in a day when they believed in enshrining sentiment in literature and were not ashamed to express their emotions, can touch me more quickly than anything else I know. We must work hard and we must be practical to get ahead in the world, but let us not overlook the sentimental side of life.

THE WISCONSIN FARMER

A WEEKLY JOURNAL OF AGRICULTURE, HORTICULTURE, STOCK RAISING AND ALLIED INDUSTRIES

BY JAMES M. PIERCE

JAMES ATKINSON, Editor-In-Chief

ESTABLISHED IN 1848

Entered at Des Moines Postoffice as second-class matter

PUBLISHED EVERY THURSDAY

1912 Grand Ave. Des Moines, Ia. | 201 Washington Bldg. Madison, Wis.

To either of which communications relating to subscription or advertising may be addressed.

MEMBER AGRICULTURAL PUBLISHERS' ASSOCIATION
MEMBER AUDIT BUREAU OF CIRCULATIONS

SUBSCRIPTION RATES—Single subscriptions, $1.00 a year. In clubs of ten, 75 cents a year and an extra copy to getter up of club. In clubs of fifty or more, 25 cents a year. Single subscription three years in advance, $1.50; five years in advance, $2.50; ten years in advance, $5.00. Subscription prices in Canada, $1.50 a year. Remit by draft, registered letter, postoffice or express money order. In changing address, send both the old and new addresses. In renewing, give the same name and initials as you gave before or state both the old and new names, and explain why you make the change. In case of errors or failure to receive the paper within two weeks, promptly notify the publisher. Address WISCONSIN FARMER, MADISON, WISCONSIN

Appreciates Wisconsin Farmer Articles.

THE WISCONSIN FARMER receives many letters of commendation from farmers and business men of the state, which are welcomed because of the spirit of co-operation which they express.

It is seldom, however, that we get a letter which pleases us so much by its atmosphere of appreciation and mutual helpfulness as the following, from Mr. George D. Bartlett, of Milwaukee, secretary of the Wisconsin Bankers' Association:

Editor Wisconsin Farmer, Madison, Wis. Dear Sir:—I want to thank you, on behalf of our Wisconsin Bankers' Association and our agricultural committee, for the splendid write-up you gave our recent Banker-Farmer Conference at Madison. I also very much appreciate your recent editorial entitled "Getting Acquainted With Your Banker." I shall try to see that a reprint of this editorial reaches every banker in Wisconsin, with the recommendation that "the banker get acquainted with his farmers." Those of us who have been active in trying to establish a closer relationship between the banker and farmer have realized how hard it is to interest many bankers in this proposition. This is not because the banker does not feel that he is interested in the farmer and his occupation, but because many of them have felt that the farmer does not welcome any suggestions from the banker along the lines of agricultural betterment. Your editorial very truthfully states that the bankers of Wisconsin are not undertaking "to teach the farmers how to farm." But we have been trying to call the attention of Wisconsin farmers to the results of experiments carried on for years through the Wisconsin College of Agriculture, and which have resulted in many improved methods of farming, as compared with the way "grandfather used to farm." We are very glad to have so many words of commendation for our efforts from the 458 farmers who attended the recent conference at Madison. Again thanking you for your kind mention of our efforts, Respectfully yours,

GEO. D. BARTLETT,
Secretary Wisconsin Bankers' Association.

The Wisconsin Farmer devoted considerable attention to the recent Banker-Farmer Conference at Madison because it represented exactly the sort of co-operation between the business interests of the town and farm that we believe will result in the greatest good to the state. In no state that we know of can such a harmonious relationship accomplish greater good, and in none are the farmers and bankers alike so awake to the mutual advantages of such co-operation as in Wisconsin.

In a large measure this spirit is due to the splendid leadership of the officers of the Wisconsin Bankers' Association, such as Mr. Bartlett. The vast majority of bankers in an agricultural state like Wisconsin are country bankers, who understand the problems of the farmer. Most of the officers of the state association for years have been men from small rural communities like Mr. Bartlett, who came from Stanley county. They appreciate the farmer's viewpoint and understand much about his problems and they are always ready and anxious to learn more.

The average banker is a deep student; he knows that land is the basis of all wealth and that its proper development and improvement mean prosperity all around—for the town as well as for the country.

So again we say to our farmer readers: Get acquainted with your banker. Welcome his interest in your business—the largest business interest with which he has to deal. Help him to a more complete understanding of your needs and problems, and in nine cases out of ten you will find in him an interested and sympathetic friend, who can and will help you to bigger and better things for yourself, your community and your state.

The Wisconsin Farmer trusts that the banker-farmer idea will not end with a single conference. Others like the one at Madison should be held in course of time. The possibilities for good from such co-operation are unlimited, and we pledge our heartiest support in helping farmers and bankers alike to realize these possibilities for the good of the entire state.

Wisconsin Cow-Testing Reports.

THE WISCONSIN FARMER is in receipt of a letter from W. E. Meyer, assistant in the division of Western Dairy Investigations, under the department of agriculture. Mr. Meyer was recently a resident of Wisconsin and he is very much interested in the cow-testing reports which are run regularly in The Wisconsin Farmer as a special and exclusive feature of this paper. Mr. Meyer writes:

With considerable interest and enthusiasm I have been reading the reports of cow-testing associations in Wisconsin, having spent some time in co-operation with Mr. Searles in organizing a number of these associations last year.

Mr. Meyer also encloses reports from the Enumclaw, Washington, and Buhl, Idaho, associations, which demonstate the possibilities in dairying in this western country. The Washington report shows seventeen cows above the fifty-pound butterfat mark for January. The stock is mostly Jersey and Holstein. A good deal of the better dairy stock in the state of Washington came from Wisconsin and it is interesting to know that records are being kept and that western dairymen are catching the spirit of "better cows."

The Buhl, Idaho, report sent us by Mr. Meyer, contains a list of forty-one cows with a record for February of forty pounds of butter fat or better. The record cow for the month is a grade Holstein, aged five years, freshened January 5, 1916. She gave 2,111 pounds of milk in February, with an average test of 3.8 per cent, and a total butter fat production of 80.2 pounds. The three top cows on the list were grade Holsteins and the fourth cow a registered Jersey.

It occurs to us that Wisconsin dairymen should take satisfaction in reading these far western records. It leads us to consider the wonderful records which are made in the way of production here at home, and to be grateful to the fact that we are close to big markets.

Since dairying has become such a profitable industry, it is not surprising that it is taken up with vigor in other parts of the country, where until recently dairying has been neglected. Wisconsin is furnishing the standard as well as a good deal of the stock for these far western dairy herds. As these herds increase, and as more and more western farmers engage in dairying, the demand for good foundation stock from Wisconsin will continue to grow. It appears that good dairy stock is a very staple property for a Wisconsin farmer to own. The better it is the more staple it is. These western farmers are constantly looking for better stock.

Only a few months ago the writer visited creameries in Cheyenne, Wyoming, and Boulder, Colorado. We were surprised to find the extent to which the dairy business is growing in this country. The creameries are modern in every respect and the product extra good. These western creameries are new and they embody the best in modern creamery construction and operation. They collect cream by express from a large area. Creameries in this section are few and far between, but they are up-to-date in every particular. In this respect Wisconsin will have to be alert to the end that the newer dairy countries do not get ahead of us.

The Farmer and the Tractor.

MR. C. F. ROEMER, president of the Iowa Implement Dealers' Association, accompanied the farm paper publishers who recently made a trip to Indianapolis, Detroit, Buffalo, Cleveland and Cincinnati. Representatives of the Wisconsin farm papers accompanied this tour. Mr. Roemer was asked concerning the interest which farmers in northern Iowa have in tractors. He replied as follows:

I sold a tractor just a few days before I left home. The tractor is coming into prominence in farming. The farmers are very greatly interested in it. Just as soon as we can assure the farmer that we can sell him one which will do the work, and which will continue to deliver the goods for a reasonable length of time, the farmer will buy tractors.

The remarks of this well-known implement dealer are of interest to our Wisconsin farmers. He resides in a northeastern Iowa county where the dairy business is increasing rapidly. He is the owner of a dairy barn, built on modern lines. He has recently installed milking machines. He is up-to-date and is a success as an implement dealer because he makes a study of his business. He studies the farmer and his needs and makes an honest effort to get the sort of machinery and equipment which will best please and best serve the farmer. Asked if tractors could be sold to the farmer on a cash basis, just as automobiles are now sold, Mr. Roemer answered in the affirmative. He ought to know, as he is engaged in the automobile business and sells about $100,000 worth of cars every season. Asked how much a farmer will pay for a tractor, Mr. Roemer replied that he will pay a fair price provided he can be assured an article which will give service.

Implement dealers of Wisconsin are also making a study of the tractor. At the last meeting of the Wisconsin Implement and Vehicle Dealers' Association in Milwaukee, tractors were discussed at length. The farmer may depend upon it that the implement dealer is going to offer him soon a farm tractor for general work.

One of the great tractor shows on the national circuit this year will be held in Madison, September 4th-8th. This will give an excellent opportunity for the farmers of this state to make a study of the tractor and see whether it will do what the manufacturers claim. The show at Madison should attract the attention of thousands and we believe it will. It is called a tractor show. In reality it is a tractor demonstration where the tractor will be put to the test in actual field operations.

For Wisconsin Beekeepers.

MONGREL bees have no more right for a place on the Wisconsin farm than scrub live stock. What breeding and selection is doing for the live stock industry breeding and selection is doing for the bee industry and the beekeeper, whether he owns only a few hives or is producing honey on a commercial scale, cannot afford to give the mongrels yard room. Successful beekeepers have found that pure-bred bees, better queens, clean honey and neat packages mean larger profits. The importance of better queens as well as other subjects relative to honey production are discussed in a recent bulletin from the college of agriculture. Mr. H. F. Wilson is the author. The queen is the most important individual in every colony because upon her depends the kind of bees the keeper gets. She is also the producing factor and upon her depends the strength and vitality of each colony. He sums up the requirements for a satisfactory strain of bees as follows:

Bees that will gather the maximum of honey and produce well-filled cells with clean, white combs and cappings.
Bees that build few queen cells and do not swarm excessively.
Bees that do not require too much care.
Bees that are gentle and do not run on the comb.
Bees that keep their hives clean and do not smear everything with propolis (bee glue).

Breeding for production is discussed and Mr. Wilson points out that there are at present, perhaps a dozen strains of the common honey bee, each one having been developed under conditions that have given rise to considerable variation both in color and temperament. The almost universal verdict of American keepers, he says, is that the Italians are the best. Settling upon this strain as the best, the next step would be to improve the existing stock concerning which he writes:

With these things in mind, it is proposed to encourage beekeepers to do away with all inferior stock and to develop the Italian strain only. In this way, it is hoped to reduce disease to a minimum, and, at the same time, develop other desirable traits for better honey production. This can be brought about in just two ways. First, provide ourselves with good, sound and vigorous Italian queens. Then, by preparing our honey properly and using only clean honey, lacing it in neat, clean packages. The bees will take care of themselves and the honey will need no salesman.

Too much stress cannot be placed upon getting rid of queens in weak or sickly colonies and on providing new queens for colonies that are not resistant to disease. Similarly, a new queen should be provided for a colony that is lazy, cross, or in any way undesirable. The beekeeper who has queens that are strong and vigorous and whose bees are good producers, should use her daughters in place of less desirable stock.

Fire on the Farm.

FIRE is a farm terror. But as a rule the farm fire has a small beginning. There are thousands of instances where total loss could have been averted if there had been some means at hand to fight the fire. Buckets of water may stop a blaze if the buckets are in place and enough men are near by to handle them. A modern plan to nip fires in the bud is to be supplied with bottled chemicals which may be kept constantly ready for use at the points about the house and barn where fire is most likely to occur. The expense of such protection is nominal compared to the saving which might be made on one fire. These chemicals are put up for instant use? If a blaze starts from a gasoline or oil stove or from the kitchen range, it may easily be confined to one room, and often to one corner of the room. Thus the balance of the home is saved, together with all the valuable furnishings.

The overturning of a lamp in a bedroom may cause a blaze which would get a big start before it could be subdued by buckets of water. But the blaze might be put out in a jiffy with chemicals which could be reached with a few steps. It will pay the farmer to investigate these matters. Many people now carry such protection along with them when they go motoring. A few dashes of the right chemical may save lives as well as property. It is worth looking into. The farmer has greater need for these modern methods of fighting small fires than has his neighbor in the city or town. The farmer has no fire department service which he may call out with the sounding of an alarm. He must depend upon his neighbors coming in when they see the house or barn or other building all ablaze. Help which comes at such a time is too late to be of any value.

The publisher of The Wisconsin Farmer has had some experience with fire. His publishing plant is equipped with a sprinkling system which provides a flow of water in any room or hallway just as soon as there is blaze enough to melt the wax covering the opening in the pipes. This system is put in because the publisher has large investments in his plant and would be seriously hampered if his property were destroyed. But the plant where The Wisconsin Farmer is published could be replaced in a short time. A fire would probably not occa-

sion any loss of life. When the farm barn burns and destroys the stock and crops it is proportionately a greater loss than any business house would sustain. It is no light matter to build up a paying herd. Crops saved for feed may be replaced but at a cost usually which robs the farmer of his year's profits. Hence the farmer should be a student of fire prevention and should avail himself of modern methods of stamping out the incipient blaze before it licks up his property.

Another Wisconsin Sale and Show Barn.

IT IS announced that a contract has been let for the new sale and show barn at Waukesha, which is to be erected by the Waukesha County Live Stock Breeders' Association. A portion of the building will be finished by June 1st to accommodate the annual Holstein sale, June 1st, and the annual Guernsey sale, June 7th. These two events are of greatest importance to the live stock interests of the county.

Because of the increased cost of building materials there was some talk of postponing the erection of this sales pavilion for another year. But the breeders have come to the decision that the value of the property for this year will be sufficient to warrant the increased cost of construction. Arrangements have been made to take care of the additional funds needed. This sale pavilion, when finished, will be an important center in the Wisconsin and western live stock world.

Why Packers Are Buying Direct.

IF THERE formerly existed collusion between live stock commission firms and the packers the situation has entirely changed and they are now experiencing the results of collision. It is a rumpus of no mean proportion, as it involves the whole question of employing a third party to dispose of live stock when it reaches destination. The commission agents have in the past taken the place of stock owners who in thousands and tens of thousands of cases do not accompany live stock to market. Under this system certain abuses have grown up according to the views of the packers, and to correct these an attempt has been made during the last year to buy direct. In other words, the packers send live stock representatives right out to the farmers, where they make purchases on the basis of weights at the terminal market. This, of course, cuts out the middleman and results in a serious clash of interests.

As there are two sides to every question, this one is presumably not an exception, and in a recent issue of the National Provisioner the packers' side is presented. From the following statement taken from this paper the reader will be able to get a fairly clear idea of the argument used by the packers in defense of the direct buying plan:

It may be that direct country buying had its inception through a desire to avoid impositions put upon customers for live stock in the open markets.

One of these impositions was the unloading of diseased animals on the packer, who paid for them at meat price and had to run the risk of government condemnation for disease afterward. The live stock man pocketed his money and went home happy, leaving the packer to stand the loss.

The other imposition is the one just referred to, the practice of filling up meat animals with hay, salt and water to inflate their weight before they pass over the scales to the packer. The latter is made to pay meat price for something that evaporates between the time he buys the animal and the time it is slaughtered.

This practice is familiar to the trade as the "fill." There is no secret about it. No apology is made for it. On the contrary, live stock commission agents advertise their ability to "get a big fill" for their clients—that is, they claim ability to defraud the packer by selling him water at meat prices. And on this ability they base their claim for business, and their arguments in behalf of the "open market" as contrasted with direct country buying.

Some time ago the National Provisioner reproduced an illustration, appearing in the advertisement of a live stock commission firm in a Kansas City market paper, which tells the story better than words can picture it. It shows that the live stock men even joke about the fraud they perpetrate on the packers. It pictures a live stock man pumping water into a beef steer with the aid of a fire hose, with the legend underneath: "We get the Big Fill!"

Right now a live stock exchange is publishing a series of letters to live stock shippers, advertising and advocating this practice. Knowing what the "fill" is and what it means, the following extracts are certainly rich reading:

"The fill at the market will always more than pay market expenses."

That is, the added weight secured through this practice is enough to counterbalance the cost of marketing.

"Hogs are sold on the open and competitive market with a fill; and the price of that fill is so much money in the pocket of the shipper. Consigned to the packinghouse direct, they are weighed empty (!), right off the cars, and the tickets are marked at average prices of the day, based on sales made on the open market, where the owner is paid full price for the fill."

That is, sell your live stock through us, for we get full meat price for the water we pump into your animals; while if you ship them direct to the packer he pays you only for the actual meat weight of the animal. Lovely ethics, these of the live stock men!

"Current fills are 400 to 700 pounds."

The live stock commission men even go into figures showing exactly how they work it.

"One load, sixty-four head of hogs, weighed 14,060 pounds off the cars; 16,640 pounds when sold, a fill of 660 pounds."

Other illustrations are given and the experience of an Iowa shipper is quoted, showing how he got pay for 400 pounds more per car on hogs "waterlogged" before being sold to the packers!

There is a lot more similar ingenuous statements as to details of this practice, and argument in its favor, contained in the advertisement referred to. None of it is more ingenuous than this:

"Why give the packer $50 per car, or more, as a gratuity? When he buys on the open market he pays that much, or more, for the fill!"

The advocates of this practice are even so bold as to admit their published statement that the packer would avoid this imposition if he could; but he can't! They say:

"Packers undoubtedly would buy without a fill at the open market, but the practice there being firmly established, they are doing their best to cheapen cost by weighing direct consignments empty."

That is, without the salt-water filling!

And yet these same live stock men are at this moment asking the government to proceed against the packers for illegal collusion in attempting to buy live stock to the best advantage—that is, to avoid as far as possible this and other impositions practiced on them by live stock interests and agents!

While every stockman is familiar with the practice here referred to as getting a "fill" at the central market, it has always been supposed that allowance was made for this artificial increase in weight in the fixation of values. In other words, it is fair to assume that buyers for the packers, knowing that this practice of "filling" prevailed, placed a lower valuation on every animal purchased than would have been levied had all animals been bought direct from the cars. It could scarcely be otherwise, as indicated by the fact that the business of the packer has been a profitable one. He would have faced dire disaster long ago, for it would not be possible to pay market prices for say fifty pounds of "fill" on every steer and yet come out even on the dressed meat, saying nothing of realizing a profit. Somewhere along the line the matter has been cared for in the regulation of prices.

This paper will endeavor in the near future to obtain for its readers the arguments advanced in opposition to the plan of buying direct.

Smut-Treated Oats Not Injurious to Live Stock.

A NUMBER of subscribers have called attention to the fact that they have a supply of seed oats left over, these having been treated with formalin to destroy smut. The question with these individuals is: Can these oats be used for feeding purposes without in any way endangering the health of animals?

Formalin used in this way is in no sense injurious. It is a powerful disinfectant, but it is not a poison in the ordinarily accepted sense of the term. Used in such small proportion as is the case in treating oats for smut, the amount of formalin adhering to the grain is so small as to be entirely negligible. There need be no hesitation whatever in feeding grain of this kind to horses, cattle or hogs. If the grain proves to be in any way unpalatable this can be overcome by mixing it thoroughly with untreated grain. However, we have never known a case where the formalin treatment even resulted in making grain unpalatable.

Horsemen Must Safeguard Their Own Interests.

A COMMUNICATION appeared in a recent issue of this paper from a subscriber who claimed that certain horsemen overworked the idea of finding blemishes. These individuals, he claimed, looked with greater diligence for defects than for utility points, and the practice was roundly denounced. His communication has brought another subscriber to his feet, and he, in turn, is of the opinion that there are two sides to this question. If the so-called "blemish eye" is a disease it is not of a seriously infectious character, and this subscriber is of the opinion that most horsemen would benefit by a slight touch of it. Among other things, he says:

There are a variety of blemishes, the hereditary ones and those which are caused by injury. There are also venereal diseases which should also be considered as blemishes. All of these have their weight on the value of a horse if thrown on the market, while the hereditary ones should be avoided with breeding animals.

Sires with sidebones, bogs or periodic ophthalmia (moon blindness) are very apt to transmit these forms of unsoundness to a certain percentage of their offspring.

On the farm there are a great many horses that work their natural lives with blemishes that would make them practically worthless on the open markets, and I don't believe there are many professional horsemen running around over the country pointing out these faults just by way of displaying their ability as judges. On the other hand some quack who imagines that he is a keen judge of horseflesh is the man that really has the blemish eye and he goes around calling attention to those things, simply to convince the public that he knows what he is talking about, and I'll admit that it is sometimes disgusting to listen to him.

It is also very noticeable that many farmers over the country are lacking in horse lore and I believe that the place that it can be noticed the easiest is at the country auction.

In the past I have often stood in the ring at a farm sale and listened to a farmer represent his horses as sound (through ignorance) when they were carrying various blemishes on which they could be rejected, and I have almost as often seen some farmer bid off a sideboney, windy, heavy or blue-eyed horse just because he didn't know the difference.

I have shown quite a lot of pure-bred draft horses at different state fairs and live stock expositions, and, as I look back over my experience I find that I never won a championship with a blemished horse, and then again following up the horse markets I find that the buyer that hasn't a good eye for blemishes seldom prospers.

Every man who has ever purchased a blemished horse with the hope of selling him again could fill the space of several paragraphs if he rightly expressed his disappointment. The facts in the case are that even the best of judges and those most competent to detect forms of unsoundness and blemishes are in some instances deceived in a way that involves them in a loss if they make purchases. Just recently our attention was called to an instance where an expert horseman, a gentleman who purchases thousands of animals every year, paid a good round price for a gelding afflicted with a malignant type of poll evil. This horse had been operated on several times, but no recovery was effected save only for short intervals when the wound would heal, only to break out again a few weeks later. A very large scar appeared on this horse's poll, but this seasoned horseman failed to exercise his "blemish eye" in this case, and he paid $175 for a horse that was absolutely worthless.

Then there is the jack spavin which has fooled many a horseman. As this form of unsoundness affects the bone, the value of many a horse is greatly reduced by this defect. In spite of this, buyer after buyer will pick up an individual of this kind without being able to detect the unsoundness, possibly on account of the natural prominent character of the hock joint. Soon the horse goes lame and the owner's heart fills with sadness. Individuals of his type are responsible for spreading the disease known as the "blemish eye."

The First Cutting of Alfalfa.

WHERE alfalfa has come through the winter in good shape it is now forging ahead of the grasses, and it will only be a short time until the sickle will need grinding for an attack on the first crop. Those who have had experience in the past are familiar with the habits of the crop and they need little advice about when to start the mower. On the other hand, the beginner should be willing to learn from the experience of others, and on this question of cutting something may be learned from a brief review of the dominant character of this crop.

Until within the last few years it was customary to gauge the time of cutting by the condition of the bloom, but in recent times it has been found that this is not a safe rule to follow. Cutting when one-tenth of the plants are in bloom may, under certain conditions, answer the needs of the situation, but it is a much better plan to observe the new plants that spring from the old crowns. At a given signal from nature there is developed from these crowns certain leaf buds, and when these buds begin to open, thereby showing tiny sprouts, this means get the mower ready.

These sprouts are nothing more nor less than the second crop coming on. They develop rapidly under favorable conditions and unless the first crop is cut the mower is apt to sever these tender leaves, thereby severely checking the second growth. If the crop is cut before these buds open out they are retarded in their development for the simple reason that they depend upon nourishment from the roots and leaves of the mother plant for their food supply and they must actually have this supply in order to insure a vigorous growth until the leaves open out to the air and sunshine. These buds are not self-sustaining, and while early cutting may not kill the crop, owing to the large supply of food materials in the root, still it will check growth and unquestionably lessen the yield of the second crop. It is most fortunate that the alfalfa crop reaches the ideal condition for curing into nutritious hay just at a time when the leaf buds referred to begin to open out. If cutting is long delayed it means that the crop will be woody in its nature, while premature cutting would result in a green, washy product that is very difficult to cure into hay.

Meaning of Term "Thoroughbred."

THE term "thoroughbred" is a much misused word in connection with live stock breeding operations. Mr. F. A. Geitz brings the matter up at this time and asks for information concerning the proper use of this term.

This term has one correct application only, namely, the name of a breed of English running horses. It should never be used synonymously with "pure bred," the latter being the term employed to denote the absence of alien blood in the ancestry of an animal.

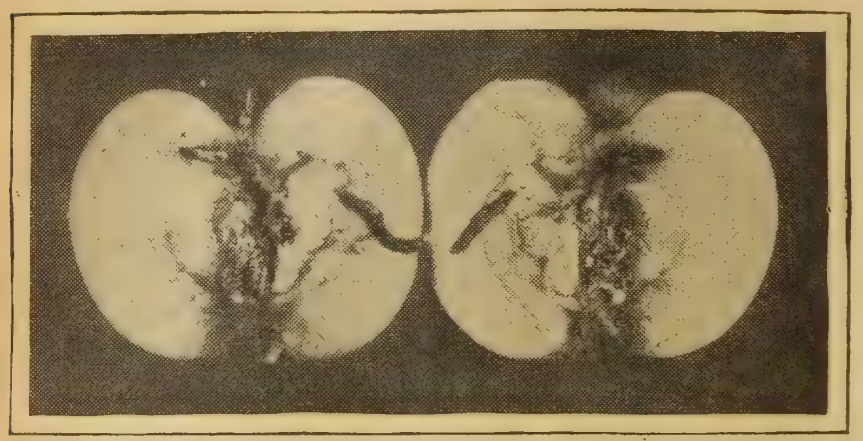
From what already has been said the conclusion will be at once reached that there is no such animal as a "thoroughbred Guernsey" or a "thoroughbred Jersey" or "thoroughbred poultry," although, on the other hand, there are thousands of "pure-bred" Jerseys and Guernseys and innumerable yards full of "pure-bred" poultry.

It is quite likely that those who have misapplied this term will continue the practice in spite of anything that is here said, but our hope in calling attention to the matter at this time is that our younger readers will learn early in life the proper use of this term. It requires no mental effort to apply the term correctly under all conditions and correct speaking, particularly when we come to deal with pure-bred animals, is an important part of the business. The successful breeder acquires the habit of being somewhat exacting in all his practices. This applies to the feeding methods that he employs and to breeding operations. He acquires, as it were, a technique peculiar to his own business, and there is just as good reason for the breeder being technically correct in all his remarks as a professional man, be he in the profession of law, medicine or dealing in the fine art of literature itself.

SPRAYING FOR CLEAN FRUIT.

The Apple Worm, Wisconsin's Greatest and Most Costly Apple Pest, May Be Easily and Successfully Controlled by Applying Poisons—Will Also Check Leaf-Eating Insects—Hints on Spraying Materials.

IN THE life of every insect there are certain periods when practical control measures can be applied with greater success than other periods. In the case of the codling moth or "apple worm," which is Wisconsin's greatest apple pest at this time, the period of control is between the hatching of the eggs and the entrance of the larvae into the fruit. The consequence is that this is the season when the orchardist and the farmer with the home orchard must be on the alert to prevent damage to his coming apple crop.



SHOWING THE WORK OF THE CODLING MOTH IN A SPLIT-OPEN APPLE —THIS PEST COSTS WISCONSIN FARMERS AND ORCHARDISTS APPROXIMATELY $1,000,000 A YEAR.

The codling moth is found in practically every apple-growing region of the country and its ravages, estimated to cost Wisconsin farmers about $1,000,000 a year, can be readily controlled by the application of arsenical poisons at the proper periods. This insect, which is to be found in almost every apple orchard, causes the young apple to drop from the tree and the well-known "June drop" is usually due to its attacks. Two broods are produced annually and to successfully control it spraying must be continued throughout the summer.

The first brood appears when the apple trees are in bloom, at which time the larva emerges from the cocoon in which it has passed the winter beneath rough bark or among rubbish and lays its eggs on the young apples or leaves, from which hatch the tiny "worms" that burrow into the apple. The larva, when mature, spins a cocoon from which hatches an adult moth about the last week of July. When the eggs are again laid about the first week of August another life cycle as above has passed, except that in Wisconsin the mature larvae spin up in favorable locations and remain so over winter, ready for the next spring. There is an abundance of evidence to show that spraying for the codling moth can be made from 90 to 99 per cent efficient. As high as 99 per cent fruit has been secured from the calyx spray alone, although J. S. Sanders, state entomologist, and H. F. Wilson, entomologist at the college of agriculture, advocate at least three sprayings, while more than four Mr. Wilson considers unnecessary. The first spray should be applied just after the petals fall from the tree, as about 60 per cent of the larvae of the first generation enter the fruit at the calyx end and the others from the side. By keeping the leaves and skin of the apples coated with poison the death of the insect before serious damage is done is sure to result. This first spray, according to Mr. Sanders, should be of arsenate of lead, one to one and a half pounds of powdered (three pounds of paste) in each fifty gallons of water.

The second application should come from ten days to two weeks later and should be of the same strength as for the first. In speaking of the time of application, Mr. Wilson, before the last convention of the Wisconsin State Horticultural society, said that although there may be some disagreement over the time for the second, third and fourth applications, that all must agree that the first should be applied after the petals drop and before the calyx lobes close. These close within a week or ten days after the petals fall and if the poison does not reach the calyx cup the most vital point of attack is left unprotected. The second spray is planned when the eggs are hatching and the first brood of tiny "worms" are entering the fruit, which is from ten to fourteen days after the first spraying.

The third application is made to catch the larvae of the second brood and should be made during the last week in July or early in August. At this season the Wisconsin orchardist is interested in the two initial sprays, which, properly done, will result in clean fruit for him this year.

Lime-sulphur solution (or Bordeaux mixture) may be combined with all these three sprayings to control the "apple scab" by using one and a half gallons of commercial lime sulphur to each fifty gallons of water. These sprayings will also control the foliage-eating caterpillars as well as the codling moth. When a fourth application is deemed advisable for late "worms" and bud moth larvae spray three weeks after the third application.

Mr. Wilson points out that unsuccessful control of the codling moth may usually be found due to one or more of the four factors that follows:

1. Lack of personal supervision of the spraying operations.
2. Inefficient spray outfits.
3. Careless application of spray and failure to cover the leaves and fruit thoroughly.
4. Lack of knowledge of the habits of the insect and the damage it does.

In spraying the following practice should prove satisfactory in all cases:

1. Never spray when your engine is running under 150 pounds pressure.
2. A forceful spray, whether driving or mist, is absolutely essential for thorough work and penetration to all parts of the tree.
3. A driving spray should be used for the first application in order to reach the inner cup.
4. A mist spray, being more economical than the driving and just as effective, should be used for later applications.

The terms used in methods of application designate driving sprays and mist sprays. A driving spray is one in which the spray is forced through a coarse nozzle in a heavy stream, so as to completely drench the trees or foliage. A mist spray is one in which the spray is forced through a fine nozzle in the form of mist and it is desired to thoroughly coat all parts with a fine film without causing the spray to form into drops and run off. From the standpoint of economy the mist spray is the more desirable, since only half as much spray will be used in this as in the drenching spray. In either case, satisfactory results can only be obtained by steady and strong pressure. A little experimental work by the orchardist himself will most likely determine the proper method to be used in his case.

The necessity of great care in using combination sprays was brought out by Mr. Wilson, who pointed out that in the economy of spraying combination or mixed sprays have been evolved for the purpose of fighting insect pests and fungous diseases with a single spray. In this work arsenate of lead, Black Leaf-40, etc., seem to mix well with the fungous sprays and these mixtures are now a part of general orchard practice. The greatest difficulty comes from the fact that both Bordeaux mixture and lime sulphur have a tendency to cause spray injury and in the case of lime sulphur when the arsenates of lead are added such injury is apparently greatly increased.

Experiments show that at the time of the first application for codling moth the combinations are much safer than for later applications. That climatic conditions may and do enter to complicate the spray problems is quite evident. Just why spray injury is more prevalent in some seasons is a problem that still needs considerable research work and until solved or until some fungicide is found that will control apple scab without causing spray injury the growers must expect to suffer a loss in this manner. There is a general agitation at this time regarding sulphur as the most likely material to do this and there are a number of sulphur compounds on the market which give promise of some merit. Just how they are going to turn out, Mr. Wilson says, is still an open question.

THE APPLE BLOSSOM AT THE PROPER TIME FOR SPRAYING FOR THE CODLING MOTH WHICH CAN BE EASILY AND SUCCESSFULLY CONTROLLED.

EFFICIENT SPRAYING MACHINERY MAKES THE WORK EASIER AND MORE THOROUGH. CLOSE ATTENTION TO THIS DETAIL IS ONE OF THE FACTORS INSURING CLEAN FRUIT.

Mr. Wilson, in speaking of efficient spraying machinery at the horticultural convention, said:

No orchardist can hope to be lucky enough to successfully control insect pests and fungous diseases year after year if he has an inferior and inefficient spray outfit. In any enterprise success depends upon efficiency, and, as the efficiency is great or small, so will the enterprise be. In my opinion, after thorough application, the most necessary thing in successful spraying is pressure; not pressure that varies from fifty to 250 pounds, but pressure that stands at 150 pounds or over all the time. It is sometimes hard to keep this up on account of leaky valves, poor packing in the pump, etc., but certainly there is no economy in permitting such conditions to continue. Neither is there economy in using worn out, leaky hose or connections. Probably the most provoking and sometimes unavoidable trouble is with the engine. Of all the tortures invented by the evil one, certainly the poorly working spray engine is the father of them all. The outfit to be used rests mostly upon the judgment of the grower. Of the various power machines manufactured, it is hard to choose the best. Any one of the standard makes should prove satisfactory.

By adopting these methods we can raise clean fruit.

Where Testing Pays and Why.

Experiences of Dairymen in Waupaca County as Shown by Annual Testing Report---By George L. Moss, Official Tester.

FOLLOWING is the report of the Waupaca and Butternut Ridge Cow-Testing Association for the past year. In all 361 cows completed the year's work. Our best cow produced 10,201 pounds of milk, testing 5.38 per cent, making 5,494 pounds of butter fat valued at $181.15. This was a native cow owned by Tom Farley. She consumed $29.82 worth of roughage and $37.79 worth of grain, making a total feed cost of $67.61, bringing a net profit of $113.54, returning $2.68 for every dollar's worth of feed. This cow is a persistent producer as she has been in the association for three years and she has returned a profit of $335.33. She belongs in the herd that produced an average of 386.9 pounds of butter fat, with an average production of 9,182 pounds of milk from eleven cows testing 4.21 per cent. The gross income per cow is $125.83. The average cost of roughage is $28.73 and grain $23.08, making the total feed cost $51.81 per cow. The average profit is $74.02 per cow, returning $2.42 on every dollar expended for feed.

Our best herd for returns on the dollar is a grade Jersey herd owned by Herman Becker. They returned $2.58. His average production of butter fat is 337.5 pounds from fifteen cows, 5,822 pounds of milk is average milk production, testing 5.79 per cent. His cost of feed was $41.71, leaving a net profit of $66.80.

Our second best herd for butter fat production is owned by E. L. Schroeder. The herd consisted of five grade Guernseys, two grade Jerseys and three natives. Their average was 346.6 pounds butter fat, with 7,186 pounds of milk testing 4.82 per cent; $111.41 was the average gross returns and $52.33 was the average cost of feed, making a net profit of $59.08, returning $2.13. This herd did remarkably well, as their pasture was not as good as most herds have. They had to be fed more grain to balance poor pasture. This is the cause for lower returns than from the former herds mentioned.

The herd that came third for returns was a grade Guernsey herd owned by John C. Backes. They returned $2.38. We have several herds that did exceptionally well, many herds averaging over 300 pounds of butter fat. Our poorest herd averaged 169.8 pounds butter fat, with 4,317 pounds of 3.93 per cent milk. Average gross return was $55.40, with an average feed cost of $35.50, leaving a net profit of $19.90 per cow, returning $1.56 for every dollar expended for feed. This is one place where the farmer was tested as well as the herd. His ration was 1-12 before he joined the association. A year ago he received $19.45 profit from sixteen cows. This month the cows show a profit of $59.50. Seven thousand three hundred and thirty-nine pounds of milk was total milk production the first month he was in the association. This month his total was 9,795 pounds from sixteen cows and 389.2 pounds of butter fat, where it was only 265.4 a year ago. If everything goes well I believe this herd will reach an average of 225 to 250 pounds butter fat this year. The poorest cow belongs to this herd, making 111.8 pounds of butter fat from 2,776 pounds of 4.02 per cent milk. Her total cost of feed being $32.72 and her gross income only $36.35, she returned only $3.63 profit, or $1.11 for every dollar expended for feed.

We have two heifers in this association that made a fine showing. Mr. L. R. Constance has one that produced 350 pounds of butter fat and Mr. E. L. Schroeder has the other which produced 363 pounds of butter fat. Both these records are well worth comment and are a very fine showing for the first year's work.

This association is on with its fourth year's work, which is good evidence that it pays to continue cow testing. Mr. H. C. Frihart says one reason why he continues cow testing is he cannot afford to feed $600 or $700 worth of feed without knowing what each cow is doing. Another reason is that the work is done on time whether he is busy or not or whether he is home or not and he always has a full record of all his cows for the year. Mr. M. J. House says after he joined the cow-testing association he took more interest in his cows, fed better and gave them better care. He culled out two cows and has replaced them by four heifers, and he is receiving a check for $100 every month, where he was receiving only $60 a month a year ago. Since that time he has installed a milking machine and other up-to-date machinery. The cow tester didn't buy these for him, but Mr. House did it because he took more interest in his cows and could see there was more money in dairying if handled right. This is just an instance to show why it pays to belong to a cow-testing association. It is often said by some farmers, "Do you suppose I would pay a 'tester' to come and tell me what to do—how I should feed my cows and tell me what cows I should keep, and what cows I should sell? Not much. Do you suppose I would feed his horse and board him once a month and pay him besides, just to visit me? I guess not." Such remarks are often made by farmers who do not understand cow testing, also farmers who are in the dairy business but in the dark as to the benefits of cow testing. Some men wouldn't pay out a dollar if they knew it would return them ten, because the other fellow would have the dollar. The profitable feeding of dairy animals is one of the hardest problems of the American farmer today and they need help to get the most out of them with the least expense.

THE BEST FIFTEEN HERDS FOR THE PAST YEAR.

Rank	No. cows	Ave. milk	Ave. test	Ave. fat	Ave. cost of feed	Profit
1. Holsteins	11	9182	4.21	386.9	$51.81	$74.02
2. Guernseys	10	7186	4.82	346.6	52.33	59.08
3. Jerseys	15	5822	5.79	337.5	41.71	66.08
4. Guernseys	2	6259	5.38	337.1	56.33	52.91

Less Politics—More Business

THE **biggest** business in this country is the business of the Nation itself. The Government of the United States represents a group of huge enterprises; each one a **department** in the Nation's business.

The Farming Industry is the most **important department** in the business—it is the backbone of our whole commercial body.

The problems of running the Government are therefore the problems of the Farmer—**your** problems, and to be assured of their solution **you** must actively interest yourself in them.

What do the stockholders of a great business concern do when they want to find the man most capable of directing its affairs?

Do they hire a theorist, an orator, a pedagogue, an experienced conjuror of words?

No! They employ one who **knows**; one who has met and overcome the problems of production—of labor—of transportation—of distribution—a **Business** man who is familiar with the operation of every department of their business.

Then let us get together—for each one of us is a stockholder in this Nation's huge business—and elect a man to the Presidency of the United States who will be fitted and experienced to run our business—not a theorist nor a politician—but a Business Man.

Let us elect a man who will make the Flag, and not the Pork Barrel, the Nation's trade-mark.

Let's Put the AMERICAN FLAG Ahead of POLITICAL PATRONAGE

Let's have a President—a government manager—with enough knowledge of **business** to exact efficient **service** from the country's employes; to obtain maximum **value** from the Nation's tremendous expenditures.

It costs a billion dollars a year to run the Government. Experts have agreed that thirty per cent—three hundred millions—of this is wasted.

The latest report of the Secretary of the Treasury shows that it cost **SEVENTY-TWO PER CENT MORE PER CAPITA** to run the Government of the United States in **1915** than it did in **1886.**

This is no cheap country. It has money to spend, and the people are willing to spend it. But the people want to know that they are getting all that they pay for—dollar for dollar.

CO-OPERATION, which means markets; **TRANSPORTATION,** which means market roads; and **INCREASED PRODUCTION,** which means protection;—the big problems of the American Farmer—are essentially **BUSINESS** problems. Don't you think the man at the head of the National Government, who has so much to do with that solution, should be a Business Man?

Suppose you join us in this movement. Fill out the coupon and mail it; it entails no obligation.

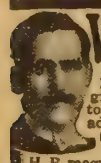
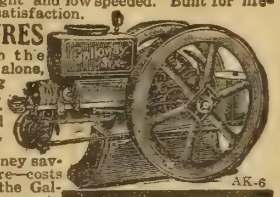
GET MY PRICE



WAIT! Get my 1916 price! Don't buy an engine of any make or kind or price until you first get my low 1916 prices and easy buying plans, including easy terms. I build these Masterpiece engines in my great chain of factories and sell them direct to farm and shop with only one small profit added to actual cost. My New 1916, 250-Page Book illustrates and describes all sizes from 1 3-4 H. P. light work engines to 16 H. P. moguls for biggest, toughest, heaviest jobs. All Galloway Masterpiece engines are large bore, long stroke, heavy weight and low speeded. Built for lifetime service and satisfaction.

1916 FEATURES Include valves in the head, (worth $15 alone, but costs nothing extra), extra large cooling surfaces, perfected oiling system, economy carburet or (a fuel and money saver, worth $10 more—costs nothing extra on the Galloway), built-in magneto and Hercules water-cooled cylinder head, an arch of strength, mechanically perfect in design, (worth $25 extra, but costs you nothing!)



LOOK! This new 1916, 250-page Book tells all about these features and many others that make Masterpiece engines superior engines and power kings in every field. Don't do a thing about buying an engine until you first get my book! Every sale backed by $25,000 bank bond guarantee, for every customer's satisfaction! Shipped from Waterloo, Council Bluffs, Kansas City, St. Paul and Chicago. Ask for my SPECIAL PROPOSITION on 10,000 engines and new book today. Address

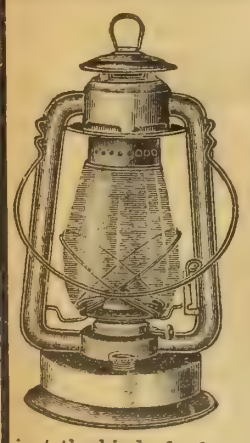
SAFETY
STORM BLAST
LANTERN FREE



This Safety Lantern cannot catch fire or explode. It is absolutely safe at all times and on all occasions. If you drop it in the hay loft, no oil can escape; if the cow kicks it over, it goes out at once.

It cannot blow out in a cyclone because of the storm blast feature. It is just the kind of a lantern every farmer needs about the house and barn.

Patent opening device raises and swings the globe free for lighting, filling and trimming. This lantern is fully guaranteed and is endorsed by the highest authorities on fire insurance, fire fighting and explosives. If dropped or turned over it immediately goes out. Oil cannot run. Impossible to catch fire. A lantern you will always feel safe with in the house or barn.

OUR OFFER

Send $2.00 for a three year new or renewal subscription to The Wisconsin Farmer and we will send you one of these Safety Storm Blast Lanterns as a premium free and postpaid.

Figuring Farm Profits.

To the Editor:—The big factor in figuring farm profits is cost of production. As we are engaged in dairying and hog raising it is, of course, in these lines I am interested. I shall write in terms of cattle, but the principles will apply to both.

In feeding cattle there is always a point in production where a man gets the most returns for feed used. Economists call it "point of maximum returns." Now, unless a man is going after production records, if he can find this point in his feeding operations he had better stop there and that is what I try to do. By knowing what milk will net us we can tell pretty accurately how much grain we can feed besides our alfalfa and silage and it is surprising how small that amount is. We find it by adding a pound of grain at a time until the gain in milk does not pay for the increased feed, then back up from there till it does.

After cost of production comes care in handling the herd and I believe the two go hand in hand, for unless a man is careful in his handling methods he will not be able to figure costs.

Another phase of cost of production is keeping the help busy all of the time and planning the work so as to accomplish the greatest amount with the smallest number of men. We find that it is usually a good plan to have several jobs going so that the men are scattered a little, as then there is not apt to be so much carelessness and loafing.

The next factor is to know when to sell home-grown feeds and buy others. This we have been able to do to good advantage quite often.

I hope to be better qualified to write of successful farming methods later, as I have been at this business but four years and am trying to build up a herd of Holsteins from common cattle.

Green Co., Wis. W. N. Preston.

H. S. CHRYSLER, TREMPEALEAU COUNTY, WIS.

PRESTON FARM HOME, GREEN COUNTY, WISCONSIN.

Increase Herds and Flocks.

To the Editor:—I was very much surprised when I learned that I had been selected as one of the winners in our county farm management contest. Although much has been written on the topic, "How to increase the production of our farms," I think we have as yet a great deal to learn. There are very few of us farmers who realize what our farms will actually produce if they are managed in the best possible manner. For one thing, we must increase our herds and flocks. We must pay a great deal more attention to the sires we are using. This will make it possible for us to double production. If we look after these matters in the way we should it may be easily possible to treble the profits. When we get down to bare facts that is what we are after. I feel sure this contest will open the eyes of a good many of us. We will see to it hereafter that we make a profit in our farming operations. The farm management contest sets an example before us of what our more successful brother farmers have been able to do.

H. S. Chrysler.

Trempealeau Co., Wisconsin.

H. S. Chrysler farm buildings, Trempealeau county, Wisconsin. Mr. Chrysler was a winner in the county farm management contest.

Farmer May Grow His Own Nitrogen.

To the Editor:—"Trade at home" has become a familiar slogan of the business world today. Well may the business farmer adopt this phrase in a modified form in so far as the fertilizer situation is concerned and instead of sending away for his nitrogen he should "grow his own."

It has long been known that the soy bean in common with other legumes possesses the ability to gather nitrogen from the air. Since this plant will thrive on sandy and other types of soils on which other legumes will not do well it stands in a class by itself as a nitrogen gatherer for worn-out soils.

The soy bean was introduced from the orient. While it has long been grown in the South, it is only within recent years that varieties have been developed which will mature in the northern part of this state. The "Early Black" is perhaps the only variety that can be depended upon to mature year after year in this part of the state. If intended for hay or green manuring the "ItoSan" should be planted. In a favorable season it will mature its seed. This variety should be planted in preference to the "Early Black" wherever it will reach maturity. It grows to a larger size and yields heavier than the first-mentioned variety. Other varieties which reach maturity about the same time as the "ItoSan" are the "Early Brown" and "Medium Early Black." All these varieties may be safely planted for seed in the southern part of the state and for forage in the northern part.

Either spring or fall-plowed ground is prepared the same as one would prepare it for corn. Since the soy bean has a longer growing season than the common white or navy bean it must be planted earlier. Corn planting time or very soon thereafter is about right. Drill the beans in rows thirty to thirty-six inches apart, using about one-half bushel of seed per acre if intended for seed. I find an ordinary grain drill, with some of the spouts stopped up, a rapid and very satisfactory way of planting. If wanted for hay leave all spouts open, drilling in one and one-half to two bushels per acre. Plant about one and one-half inches deep. After the beans come up cultivation should be continued same as for corn.

To enable this plant to gather nitrogen from the air and thus enrich the soil with this valuable fertilizer it is necessary that the soil be inoculated with the proper nitrogen-fixing bacteria. This may be done by dampening the seed at planting time and sprinkling it with soil taken from a field on which soy beans have grown the year previous. If plenty of soil is available it may be spread broadcast at the rate of one-half ton per acre. To prevent the sunlight from killing the bacteria the broadcasting should be done on a cloudy day and the inoculated soil immediately harrowed in.

Of late years it has become quite a common practice to plant soy beans with corn grown either for silage or for "hogging off." It is claimed by advocates of this system that the corn does even better than if planted alone and that the beans which may be grown between the corn represent so much clear gain. This way of planting, however, should not be attempted if the ground is weedy.

Unlike other beans, the soy bean does not shell easily. The seed crop should not be harvested until all the beans on the pod have completely ripened. Through several years' experience I have found that this plant will "wait" to be harvested for weeks and even for months after it is ripe without spoiling or deteriorating in the least even under adverse weather conditions. While to wait this long is, of course, not the best practice it certainly gives these beans a decided advantage over white beans, which will spoil in spite of all you may do if the season is rainy.

The harvesting may be done with a bean puller or with a mower.

The threshing may be done with either a bean huller or the regular threshing machine. Because of the heavy stalk and the tough pod either method will leave some of the seed in the straw. Being very rich in protein this seed should not be wasted. Any kind of live stock given access to the straw will get the valuable parts. There is perhaps no better way of exercising a drove of hogs than to give them a lot of soy bean straw to work over.

Door Co., Wis. J. A. Haas.

Treat Potato Seed Against Disease

Disinfection Means Freedom From Scab and Blackleg in Addition to Increasing the Yield---Hints For Wisconsin Growers.

PRECAUTIONS taken against disease now by the potato growers in Wisconsin will mean greater profits when the crop is harvested this fall. The most serious potato diseases are introduced on the seed, so that disinfection before planting will greatly reduce the danger from this source. Certain diseases, when once introduced, persist in the soil and it is necessary to rotate with other crops to free this soil of this disease which makes it doubly important that the farmer know that his seed are healthy and sound.

The potato is now one of Wisconsin's most important cash crops and is becoming more so each year with the work which is being carried on for standardization. The acreage of certified seed potatoes will be much greater this year and it is within the means of almost every potato grower to get hold of some of last year's certified seed if he so desires. This seed is grown under inspection and the growers who produced healthy stock have been granted certificates to that effect. Use of this seed will insure a disease-free seed, but those who do not know under what conditions their seed was grown or who import from other states will do well to take the precautions against disease.

Scab is the greatest parasitic disease, although it is not the only one with which the potato grower has to contend. Scab can be easily controlled by the use of formalin as a disinfectant for the seed. As the expense is small no farmer need take any chance with scab. The same treatment applies to blackleg, and this with other potato diseases is discussed by L. R. Jones, of the Wisconsin Experiment Association, in his last bulletin, on the control of potato diseases. There are, of course, many diseases, such as blight and others, that require spraying of the growing plants, but this article deals only with treatment of the seed which is of the greatest importance at this time.

While grown everywhere successfully in Wisconsin the potato is at its best on the newer lands, owing to the favorable combination of climate and soil conditions. The crop in this section is comparatively free from disease, which not only insures the heaviest yields but it makes the crop of especial value for seed purposes. It is, therefore, doubly important that the potato growers of these new sections are to use only seed free from disease.

Potato scab is caused by a parasitic growth on the surface of the tubers. The spores or germs are carried over winter in the old scab spots, or scattered in the dust from scabby potatoes which may cling to the surface of smooth tubers. The scab parasite persists in the soil many years after a crop of scabby potatoes. It will also pass through the digestive tract of stock fed on scabby potatoes. Morse, of the Maine Experiment Station, has proved that manure from horses so fed causes more scab than that of the cow. The scab germ thrives best in an alkaline soil and is checked by acidity. Hence, lime or ashes increases it, and plowing under green crops renders the soil less liable to it.

Minute insects, scab mites, and beetles often invade the scab spots and enlarge and deepen the injury. White grub and wire worm injuries may also be coupled with those of scab, but they have no regular association and are readily distinguishable.

To remedy this potato disease smooth seed potatoes should be selected; disinfect with formaldehyde (or formalin) and plant on clean soil. Clover sod is best, but any green crop turned under is helpful. Cook scabby potatoes before feeding to stock and do not use fresh manure on potato land or apply lime or ashes. Rotate potatoes with other crops, and if scab develops do not grow potatoes on that soil for five years or more.

Blackleg is a bacterial disease carried on the seed tubers. There is but little in this state now, but there is evidence that it is being introduced with seed imported from the East. It causes the seed tuber to rot early, sometimes before the sprouts break through the ground, thus giving an irregular stand and weak plants. The rot then spreads up the base of the stem, which turns black and rots as far as the surface of the soil or above. As a result of this, the plant stops growing and the leaves become pale and bend upward, giving the plant a sickly, narrow and spindling appearance. Diseased plants generally die soon without setting any tubers.

The disease is worst in heavy, moist soils, and in some cases, where it is bad, it may spread from the stem of the tubers, causing a rapid soft rot. Although this disease is not yet serious anywhere in Wisconsin, it occurs widely, and steps should be taken to control it before it becomes common, especially where potatoes are being grown for seed purposes.

This disease, also, has been the subject of careful study by Morse, of the Maine Experiment Station, who has shown that it is carried on the seed and that it is controlled by selecting sound seed potatoes and disinfecting them with formaldehyde as for scab. In addition it is well to pull up all diseased plants as soon as detected in the summer, so that they will not form tubers which contaminate the crop.

SEED POTATOES OF ALOIS STENGL, LANGLADE COUNTY, READY TO BE TREATED WITH FORMALDYHYDE AS A PRECAUTION AGAINST SCAB AND BLACKLEG.

Let These

NORTH DAKOTA Battleships Protect Your Prosperity

Here is North Dakota's *invincible Preparedness Fleet* in one town of less than one thousand population—giant elevators which house the farmers' grain.

Why don't *you* come and enjoy this protection with our North Dakota farmers? PREPAREDNESS with them means more acres of grain, more live stock, comfortable homes, schools and churches. NORTH DAKOTA is coming rapidly into its own. The 1915 crop of grain along the Great Northern Ry. in that state amounted to more than EIGHTY-SIX MILLION bushels. The acreage of corn and alfalfa is increasing enormously every year. This means stock raising, combined with grain growing, for bigger and steady profits. Dairy and live stock products have more than doubled in the past few years.

Are you farming on high-priced lands? Then read of results on low-priced land in North Dakota.

M. C. Crockett, one of our big farmers writes:—"I came from Iowa to North Dakota—came from a good stock country, and I have always kept a good herd of cattle and some hogs, and know that all kinds of live stock can be profitably raised here just as well as in Iowa. I now own 2080 acres which I have added to my homestead as I could pay for it, and I figure my soil and farm just as good as they have in Iowa for $200 per acre. And farm is not for sale."

Medium-Sized Farms Pay Best

Joseph Kasal is a 160-acre farmer in North Dakota. In 1915 he threshed from 127 acres in grain, wheat, 1,743 bushels—oats, 841—barley, 813. Cows, pigs and poultry supply the table necessities.

The Great Northern Railway has no land for sale in North Dakota, but there are hundreds of large farms like Mr. Crockett's and larger—there is a great amount of land owned by non-residents. We are interested in having these large farms divided into 160 and 320 acre working farms.

If you own or rent high-priced land, you will be interested in learning what our North Dakota farmers are doing on land equally productive, but which costs only about one-fifth as much and may be secured on very easy terms. In fact, what is ordinarily paid by renters will make the payments on a North Dakota farm.

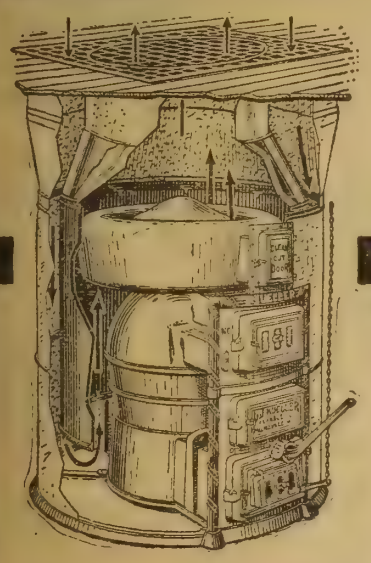
The Pipeless Way Heats Homes Easy

YOU can run a Mueller Pipeless Furnace easier than a stove and keep your whole house comfortable without dirtying your rooms. Easy to install—simply set it up in your cellar and cut one register. No pipes—no flues—no heavy expense for installation. Nothing hard to understand about it—"feeding" and tending are easy.



MUELLER PIPELESS FURNACE

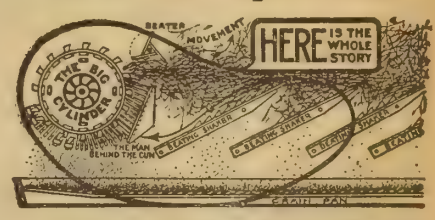
Burns hard or soft coal, coke or wood. Economical of fuel—no heat lost or wasted. Users report plenty of warmth in coldest weather and ideal ventilation all the while. Strong guarantee.

Answer this ad NOW—today. "Send your book on Pipeless Heating" is all you need to write.

L. J. Mueller Furnace Co., 204 Reed St.
Milwaukee, Wisconsin

Makers of heating systems of all kinds since 1857. Can supply you with regular hot air pipe furnaces, steam or hot water boilers and vapor heating systems. Give you honest advice on your heating requirements.

IT WORKS With Every Inch!



FROM FEEDER TO STACKER THE RED RIVER SPECIAL Is a Practical Threshing Machine

There is no waste of power, there is no waste of grain, there is no loss of motion, there is no mass of unnecessary parts that lumber up the work.

It Is Built to Separate Grain

And it does this and does it just as fast and just as well as it can be done with simple efficiency and with compound economy. It is the one supreme machine for its class of work. This supremacy has been gained by sixty-eight years of constant improvement upon the one great idea of minding your own business.

You Get RESULTS That Way

Good friends of yours are making money and saving grain by using this machine. They tell you how they do it in the Home Edition of the Red River Special paper. You'd better send in your address for a copy of the last edition. If you would like a Big Catalog, just mention it when you write.

Cow-Testing Reports.

Stanley County Cow Testing.

The Wisconsin Farmer has received the annual report of Richard F. Adams, tester of the Stanley, Wisconsin, association. There were 313 cows completing the year. They gave a total of 1,839,661 pounds of milk, averaging 4.2 per cent test and yielding a total of 77,426 pounds of butter fat. The gross returns in cash amount to 23,602. Other figures of interest are as follows:

Cost of feed, $10,663.
Profit for members, $12,939.
Average milk per cow, 5,878 pounds.
Average fat per cow, 245 pounds.
Gross returns per cow, $75.40.
Cost of feed per cow, $34.
Profit per cow, $41.33.
Return for each dollar invested in feed, $2.21.

The best ten cows produced 4,114.7 pounds of fat with gross return of 1,277,74; cost of feed $442.52; profit, $835.20.

Average of best ten cows: 411.4 pounds fat; gross return $127.77; cost of feed, $44.25; profit, $83.52; return for $1 in feed, $2.88.

The poorest ten cows produced 1,230.5 pounds fat; gross return, $361.94; cost of feed, $339.44; profit, $22.50.

Average of poorest ten cows: 123 pounds fat; grass return, $36.19; cost of feed, $33.94; profit, $2.25; return for $1 in feed, $1.06.

There were six cows which produced more than 300 pounds of butter fat each. Their average gross returns is $110.26, and the profit on each is $66.28; 252 cows below the 300-pound mark averaged gross returns of $66.96, with a profit of $34.80.

The highest average for a herd was that of G. C. Leslie, being 9,750 pounds of milk; fat, 371 pounds; profit, $59.23.

Second best herd average by P. A. Lien, 7,723 pounds milk, 316 pounds fat; profit, $56.34.

Third best herd average, Geo. Weissenberg, milk, 8,595 pounds; fat, 295 pounds; profit, $46.08.

The highest producer is owned by P. A. Lien. Her record is 513 pounds of fat, and she shows a profit of $107.90.

The second highest producer is owned by Frank Smalley, 460 pounds fat, and third by Geo. Weissenberg, 441 pounds fat.

One hundred ninety-three cows of the 300-pound class would have produced as much profit as did the 313 cows of the association. Dispensing with these 120 would have made that many less to house, feed and care for, and it would have made room of an equal number of the $83 class. Do you take the hint?

The loss of these 120 cows at the average cost of feed was $4,080. One association in the state reports ninety-five forty-pound cows this month. Another reported but fifty. The Stanley county can equal that. The advantages of right feeding are very apparent from the above figures. The well-fed cows show the profits. One of the purposes of the association is to study feeds and feeding.

Rock County Testing.

Joseph Z. Finberg, as tester, sends The Wisconsin Farmer the March report of the Rock county association, which shows that J. B. Palmer, of Milton, has the best record to date in this new association. He is milking ten cows and in March six did better than forty pounds of fat. F. O. Uehling's Guernsey still holds first place with 52.8 pounds of fat. The report follows:

Owner, name and breed	Age	When fresh	Pounds milk	Per cent of fat	Pounds B. fat

An Excellent Start.

The newly organized Chilton Cow-Testing Association, Calumet county, completed its first month of testing April 12th with seventy-three cows producing more than forty pounds of fat. This is a splendid start and shows some excellent producers. Oscar Kossman is the tester and his first report follows:

Owner and breed	Age	When fresh	Lbs. milk	Per cent fat	Lbs. B. fat
Arthur C. Peik					
G. Guern.	6	12-26	812	5.0	40.61

Settle the Silo Question

—and settle it for good. Do away with repairs, with tightening of lugs and adjusting of hoops. *Know* that your silo won't blow over. Be sure of perfect silage at all times. Build the worryless, efficient

Permanency and Prosperity—Natco Silo, 18 x 36 and Natco Barn, 40 x 150, on High Hill Dairy Farm - Pulaski, Pa.

Natco Imperishable Silo
"The Silo that Lasts for Generations"

Its hollow, vitrified, clay tile are impervious to air and moisture—they preserve the silage *sweet* and *juicy*. The dead air spaces in the wall resist frost—making it the silo for severe climates. The continuous, reinforcing bands laid in the mortar hold it in a grasp of steel. It is a silo of *efficiency*, and a silo you'll be proud of. Send for our silo catalog describing it fully.

Also get our splendid new book, "Natco On The Farm," describing other farm buildings made of Natco Hollow Tile and just as efficient. Both books free. We have many farm building plans to submit, and will help you solve your building problems, free. What are you going to build? Let's hear from you. Write today.

Natco Silo Wall. Note perforated shell, providing firm anchorage for mortar joints.

Care of a Cow's Udder.

To the Editor:—It is a calamity to have anything happen to a cow's bag. Before now we have paid a great deal of attention to the breeding, feeding and growth of a certain cow, only to have it all upset and undone by some accident to the udder. After that happens little is to be done but to turn the cow off, for practically nothing can be done for many injuries that come to this most delicate organ.

These difficulties arise from having the udder or one of the teats stepped on by a cow standing next to the sufferer; or they are due to injuries received while fighting; or in far too many cases some man who ought to know better strikes or kicks the cow in this exceedingly tender place and the trouble is one that cannot be overcome. I have known cows to be very seriously hurt in the bag by being hit with a stone thrown by the boy or man who was sent after the herd.

For this reason and others which need not be spoken of here it stands us in hand to see to it that every possible attention be given the udder of all cows. Many times men and boys do not realize what they are doing when they kick or strike the teats or upper part of the cow's bag. Whenever a new man comes into the barn to help about the milking he ought to be given clear instructions on this point, particularly if it develops that he is not inclined to be kind to animals. Young folks are especially apt to be thoughtless in this respect. They do not understand why the udder is not as tough as any other part of the body, when the fact is it is a great mass of tissue, with an intricate system of canals or ducts, all abundantly supplied with blood vessels, nerves and lymphatics. These may be easily obstructed or otherwise permanently injured. It is a thing to be startled at to see a single drop of blood coming from the udder of a cow, for it is a prophecy of the failure of the cow.

To my mind the box stall is the ideal way of stabling the cow. I hope to live to see the day when every cow will have her own roomy place to stay while in the barn. This will obviate many a serious injury of the udder from neighboring cows, as well as work to the comfort and advantage of the animal in many other ways.

E. L. Vincent.

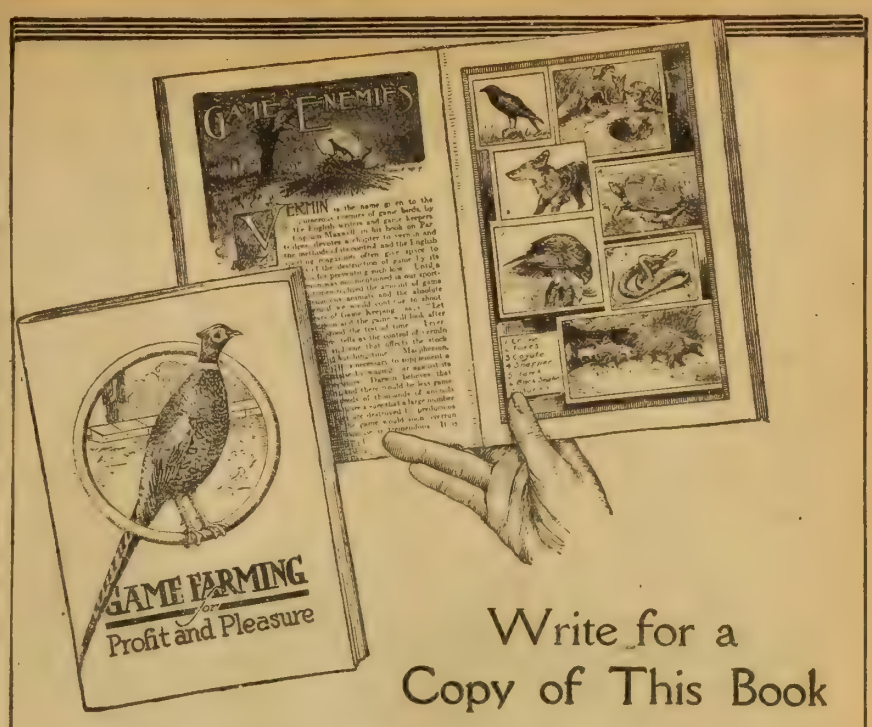
Special State Holstein Meeting.

To the Editor:—A special meeting of the Holstein-Friesian Association of Wisconsin will be held at Watertown, Wisconsin, on the evening of May 4, 1916, for the purpose of submitting to the breeders for their discussion and adoption plans which have been developed by the secretary and a special committee for making this association a more active and effective organization—one that will be of constructive service to its members and the Holstein breeding interests of the state. Every Holstein breeder in the state is invited to attend. As the Wisconsin Breeders' Holstein Sale is held at Watertown on May 4th-5th, breeders who attend the special state meeting will also have an opportunity to attend the sale. By order of the president. C. J. Schroeder, Sec.

This has been the busiest season for the State Seed Inspection Service since it was established in 1909. The regular run of dealers' samples and an unusually large number of other samples of agricultural seeds have been sent to the laboratory at the college of agriculture for inspection and test.

THE IMPLEMENT BLUE BOOK FREE.

The Midland Publishing Co., St. Louis, Mo., has left over a few hundred copies of 1915 Implement Blue Book, one of which it offers to mail free of charge, to any subscriber to this paper who will send 20 cents to pay the packing, postage, etc. The book has over 500 Royal Octavo pages, weighs two pounds and contains complete classified descriptive lists of all farming implements, tractors, tractor plows, vehicles, wagons, and kindred goods made in the United States, with names and addresses of manufacturers.—Adv.



Write for a Copy of This Book

As a practical farmer you are interested in any subject which has to do with increasing the productiveness of your farm. For this reason we ask you to write for a copy of "Game Farming for Profit and Pleasure." You will find that this book contains a mine of information that will be both of interest and value to you.

"Game Farming for Profit and Pleasure" is a carefully edited and profusely illustrated manual on the breeding of game birds. It describes in detail the habits, foods and enemies of wild turkeys, pheasants, grouse, quail, wild ducks, and related species. It tells of the best methods for rearing. It discusses the questions of marketing and hunting.

Game Farming Pays Well

The breeding of game birds should prove profitable to you from many standpoints. The demand for birds is much greater than the supply both from city markets and from those who wish to raise game. There is also a continuous call for eggs by breeders.

Pheasants, wild turkeys, quail, grouse, etc., are valuable as destroyers of insect pests and weed seeds. Furthermore the birds you raise will afford you good sport in hunting, and also food for your table. If you own large acreage, or can control it by combining and co-operating with your neighbor you may lease the privilege of shooting birds produced through your investment of money and labor. You may be able to get a sportsmen's club to furnish the money for stock and pay you for the birds raised.

The breeding of game birds either for the market or for sport is more profitable in many ways than the raising of domestic poultry. It is always far more interesting.

Write today for the book, "Game Farming for Profit and Pleasure." It will be sent without cost to you. Use the coupon below.

In and Around Wisconsin

Dairymen Form Locals in Walworth County---Cheese Organization Discussed at Meeting Held at Marshfield.

Outagamie county, at the recent spring election, voted bonds for $700,000 for road improvement in that county. It is planned to build about 100 miles of good road with this money.

Winter, Sawyer county, is assured a creamery, the details for the opening having been made recently at a meeting there. As a means of assisting the new concern the Edward Hines Farm Land Company will ship into the county four cars of Holstein and Guernsey grade cows and several pure-bred sires which will be sold reasonably to the settlers.

WINNEBAGO COUNTY ALFALFA FIELD.
On the Levi Brunson Farm near the city of Omro.

John H. Witte, a Dodge county poultry fancier at Juneau, reports that his flock of twenty Rhode Island Reds made an average of a fraction more than fifteen eggs daily during March. For the thirty-one days these twenty pullets laid 466 eggs.

Dairymen and cheesemakers to the number of several hundred attended a meeting recently at Marshfield, Wood county, to discuss plans for organizing a cheese producers' federation there, similar to the Sheboygan County Cheese Producers' Association. A committee to investigate and report later was appointed and consists of Alvin and Ed Brehm, of Marathon county; Robert Morrison, of Wood county, and Henry Fromme and W. R. Happe, of Clark county. Former Senator Henry Krumrey, president of the Sheboygan federation, and M. C. Riley, of the National Agricultural Organization Society, were the speakers.

Extensive tests with grains and forage crops will be undertaken by members of the Wisconsin experiment association this year. About forty experiments will be made with acid phosphate to determine if it will, when added to the soil, aid in producing early maturity of corn. Four hundred and twenty-five tests are listed on Silver King and Golden Glow corn, twenty-five on pedigree barley, twenty-five on spring wheat, 125 on pedigree No. 1 oats, 150 on pedigree No. 5 oats, 100 each on Turkey Red winter wheat, and pedigree rye, seventy-five on sweet clover, and a number on alfalfa and soy beans.

The Pierce County Holstein Breeders' Association was organized recently at a meeting at River Falls, which was attended by about thirty breeders of the county. J. L. Chapman was chosen president; Dwight Flower, secretary; Hugh Lowe, treasurer; H. A. Chinnock, of Troy; Fred Kurtz, of Kinnickinnic; Wm. Finley, of Clifton, and Fred Smith, of River Falls, will represent their towns as vice presidents; H. E. Bailey and Elmer Enloe, executive committee.

The creamery association at Hayward, Sawyer county, has purchased a motor truck which will be used in gathering cream in a radius of fifteen miles of the creamery. This is the first truck ever bought in that county for this purpose and will be a big boost for the dairy industry as well as the creamery.

Potato growers in the vicinity of New Hope, Portage county, have organized a local association with Ben Halverson as president and A. P. Swenson, secretary-treasurer. About fifty growers attended the local meeting. Local associations had previously been organized at Plover, Bancroft and Amherst in this county under the direction of J. M. Coyner, the new county agricultural representative.

RETURN OF SPRING RECALLS HAPPY TIMES IN THE COUNTRY.

Delavan, Walworth county, dairymen have formed a local milk producers' association with a membership of twenty-six farmers. D. E. La Bar is president and John G. Redenius is secretary and treasurer. Two organizers from the central association at Chicago were present.

Western breeders are looking more and more to Wisconsin for foundation dairy stock, and recently twenty-five pure-bred Holstein cows were shipped to the Hollywood farm, Seattle, Wash. All were of the Johanna strain and came from the Schroeder herds at West Bend, the O'Neil herd at Thiensville and the Gillette herd at Rosendale.

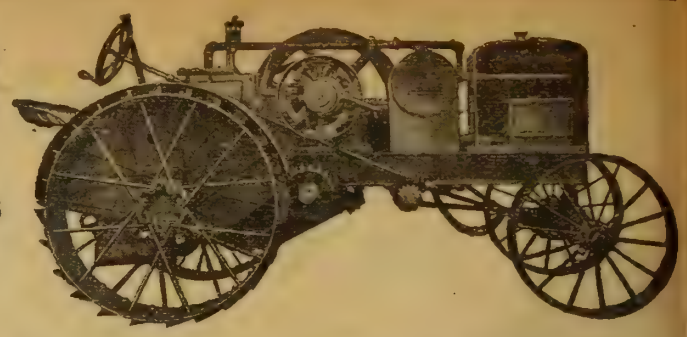
Farmers about Stoughton, Dane county, who have been growing from twenty to forty acres of tobacco annually, are reported to be cutting their tobacco acreage this year and giving more attention to dairying. They believe that less acreage and better attention to the fields will boost their tobacco profits.

Colfax, Dunn county, potato growers recently organized a local association with S. S. Sivertson as president; Martin Fruvog, vice president, and George T. Vorland secretary-treasurer. The association also voted to send a Dunn county exhibit to the state potato show next fall at Eau Claire. Growers who used certified Green Mountain seed last year reported favorable returns and showed to the meeting some splendid samples of seed.

Walworth county dairymen met recently at Elkhorn and organized a local branch of the Milk Producers' Association with a membership of 122. This organization followed the recent Chicago milk "strike," although few of the members ship to the Chicago market and had nothing to do with the "strike." Most of them are patrons of the Elkhorn factory, and M. C. Flack, of Como, was chosen president and Harry D. Dunbar, of Geneva, secretary and treasurer. Walworth, Genoa Junction and Lake Geneva were the Walworth county centers affected by the strike, and the Elkhorn association was organized largely to aid the producers in those territories. Considerable complaint was made against Chicago board of health inspectors. It was charged that they are often too authoritative, and too particular, often being ignorant of what constitutes sanitary conditions. This latter was conceded to be the exception rather than the rule, and most of those present felt favorable to inspection, if it did not go to too great an extreme. As one man expressed it, "I will produce any kind of milk they want, under whatever sanitary conditions they dictate, if they will pay me the right price for it."

The importance of the muskrat trapping industry in Wisconsin, especially about Lake Winnebago, was indicated recently at a hearing for special licenses at Oshkosh. Licenses were issued to ninety-five farmers to trap immediately, some of whom have as many as 3,000 traps. Many individuals reported individual sales of $6,000 a year. The marshes about Lake Winnebago and the Wolf and Fox rivers abound with muskrat, and the farmers lease these for trapping purposes.

EAGLE GAS Tractors



Built for Wisconsin Farms

Here's the EAGLE TRACTOR built especially for Wisconsin farms. It is the famous EAGLE two-cylinder engine in tractor form. Does all that is required of a tractor and delivers an abundance of smooth power for all belt work such as threshing, ensilage cutting, etc.

The EAGLE GAS TRACTOR will stand rough and ready usage. It is just the right weight to be practical on any medium-sized farm. All unnecessary weight has been cut out, yet nothing that would add to the strength, durability or *dependability* has been sacrificed.

This tractor is simple in construction, simple in operation and easily accessible. The average man can readily learn to work it or keep it in repair without help.

FOUR MODELS
8-16 Two Cyl. Weight 4850 lbs.
12-22 Two Cyl. Weight 5030 lbs.
16-30 Two Cyl. Weight 5700 lbs.
16-30 Four Cyl. Weight 5500 lbs.

All EAGLE GAS TRACTORS have four wheels with two drivers. They pick up a sudden load and get to normal speed quickly and smoothly. All have the famous EAGLE Valve-in-Head motor and use low grade fuel, giving low operating cost.

Every Wisconsin farmer should learn about EAGLE GAS TRACTORS. Write at once. 21

FARM MECHANICS

Auto, Farm Engine and Farm Machinery Ailments diagnosed and remedies suggested in this department

QUESTIONS AND ANSWERS.

Igniter Insulation.

I would like to know how to put in insulation in a make-and-break igniter so that it will be gas tight. Should the insulation extend the whole length of the stationary electrode? I am using a magneto for ignition. A short time ago I put new insulation in the igniter and it burned out and blew through in a few minutes. I found part of a broken carbon brush laying in the magneto. Could that have caused too much current? The mica tube for insulating is seven-sixteenths of an inch outside diameter, five-sixteenths of an inch hole.

Answer.—The broken magneto brush had nothing to do with the insulation burning out. If you are using mica for insulation it is simply a question of doing a good machanical job. If you do not get results with the mica tube obtain some sheet mica and cut mica washers enough to fill the electrode. Cut a large mica washer about one-sixteenth of an inch thick for each end. Be sure that the holes in the washers fit the electrode tight. If possible have the outside of the washers turned in a lathe to fit the igniter barrel.

Some Wiring Questions.

Do dead ending wires do any harm? Why do they put a fuse block right next to a lamp in a show case when there is only one lamp? Would a ten-ampere fuse be used? Please show how to take ceiling outlets from the circuit above when the wires are parallel with the beams; also crosswise, where tubes are used running through the beams. How far should the circular loom extend below the ceiling? Is it as good to use porcelain tubes in 2x6's as in 2x8's? Living one-half mile from the light plant would number 10 weather proof wire do for the line wire?

Answer.—Dead ending wires do no harm. Tape the ends. There is no necessity for an extra fuse for a show case lamp. The fuse would be small enough to protect the wire.

Take off the ceiling leads from the main line wires near the outlet. An "outlet box" should be used. This is fastened flush in the ceiling. The main line wires should have a support where the lead wires are taken off; or the lead wires may be run to a support and then to the outlet. The loom should extend from the support well into the outlet box. It is all right to use porcelain tubes in 2x6's if the beams are not overloaded.

Using number ten wire you would have a drop in voltage of twenty-eight volts when using five amperes of current. When using less current the drop would decrease. Using number five wire the drop would be about eight volts for five amperes.

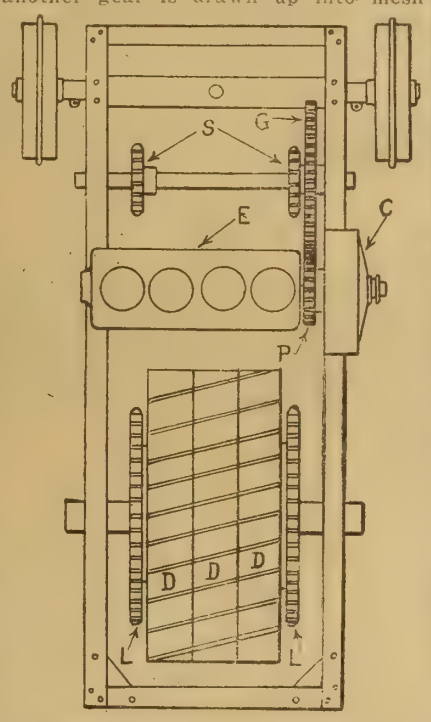
Ground Wire for Lightning.

Does a barn covered with painted sheet steel need any ground wires as a protection from lightning? If it is advisable to use a ground wire how shall I do it?

Answer.—It is a disputed point as to whether or not a ground wire is a protection against lightning. We are inclined to favor the ground wire idea. Use braided copper cable, that may be purchased from any dealer in lightning rods, or from your hardware dealer. It would be best to use at least two ground wires from opposite corners.

A Homemade Tractor.

I have a thirty-horse-power motor that I wish to use in a tractor. I am sending you a sketch of my tractor. I am using three Plano binder bull wheels for the drivers. These wheels are thirty-four inches in diameter. At an engine speed of 600 R. P. M., how fast will the tractor travel? What will be its drawbar pull? How many plows will it pull? The reverse gears are not shown on the sketch. For reverse, the engine slides back out of mesh with the countershaft gear, and another gear is drawn up into mesh



with both. In the sketch, C is the engine clutch and B a wheel, E is the engine, P is the clutch drive pinion, meshing with the countershaft gear, G. S S are the countershaft sprockets; L L are the drive wheel sprockets, and D D D are the drive wheels. P is six inches in diameter, G is thirty inches in diameter, S is five inches in diameter, L is twenty inches in diameter.

Answer.—The following rules may aid our readers in solving their gearing problems:

To find the countershaft speed multiply the engine speed by the diameter of the engine pinion and divide by the diameter of the countershaft gear.

To find the drive wheel speed multiply the countershaft speed by the diameter of the countershaft sprocket and divide by the diameter of the drive wheel sprocket.

To find the miles per hour multiply the diameter of the drivers in inches by 3.1416 and divide by 12. Multiply by the revolutions per minute of the drivers and multiply this result by 60. Divide by 5280.

Applying the above rules to this tractor.

$$600 \times 6 \div 30 = 120$$

therefore, the countershaft makes 120 R. P. M.

$$120 \times 5 \div 20 = 30$$

therefore, the drivers make 30 R. P. M.

$$34 \times 3.1416 \div 12 = 8.9$$
$$8.9 \times 30 \times 60 \div 5280 = 3$$

Therefore, the tractor should travel three miles per hour when the engine is running 600 R. P. M. There would be some slippage at the drive wheels, however.

As you are using a thirty horse power engine, you have plenty of power to slip the drive wheels. The drawbar pull will, therefore, depend upon the weight of your tractor and the ground you are working on. You can estimate your drawbar pull at about 1,500 pounds—half the probable weight of your tractor. It should pull two fourteen-inch plows under ordinary conditions.

You may have to change the cleating on your drivers to prevent side thrust. Put straight cleats on the middle wheel and right and left cleats on the two outside wheels.

Engine Horse Power.

Please send me the formula for finding the horse power of an engine.

Answer.—The general formula was given in our last issue. For a steam engine multiply the mean effective pressure by the length of stroke in feet by the piston head area in square inches by twice the revolutions per minute and divide by 33,000. The mean effective pressure may be assumed as 60 per cent of the boiler pressure. For a stationary gas engine multiply the average pressure by the length of stroke in feet by the piston head area by one-half the number of revolutions by the number of cylinders and divide by 33,000. The average pressure may be assumed as seventy pounds. For automobile engines multiply the square of the cylinder diameter by the number of cylinders and divide by two and one-half.

Power of Auto Engine.

Is there more power in a thirty-horse-power, six-cylinder motor than in a thirty-five-horse-power, four-cylinder motor. Does a six-cylinder motor use more gasoline than a four-cylinder motor of the same horse power? How can the horse power of a motor be determined?

Answer.—The six-cylinder motor pulls more evenly than the four-cylinder motor, but, if honestly rated, a thirty horse power six has no more power than a thirty horse power four. The amount of gasoline and oil would be somewhat in favor of the four, other things being equal. The mechanical condition of the motor, the design and the carburetor adjustment influence the oil and gasoline consumption more than the number of cylinders. The method of finding the rated horse power is given above. The only reliable way of finding the horse power of a gas engine is by brake test. We will publish in the near future a sketch showing how this is done.

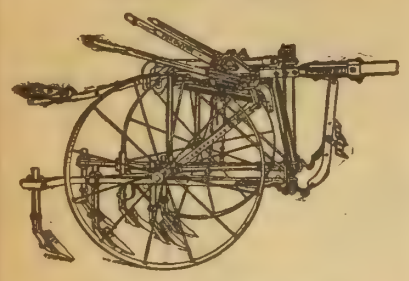
Oliver



No. 1 Cultivator

The Oliver No. 1 cultivator is of the seat guide, parallel gang type.

Since the gangs are held in parallel position under all conditions, it is impossible to swing one gang aside, leaving a row of uncultivated ground. All the ground is cultivated and narrow strips of weeds are not left to weaken the young plants.

The weight of the operator is utilized in moving the gangs. On hillside work the weight of the operator serves to keep the gangs working up the slope of the hill. This feature makes the No. 1 cultivator very easy of operation.

It is possible to balance the No. 1 cultivator for operators of different weight. This removes neckweight from the horses.

The No. 4 cultivator is the same as the No. 1 except the axle of the No. 4 is set in, adapting it for work in very narrow rows.

Ask your Oliver dealer to show you the No. 1 or No. 4 cultivator If he cannot, write us. You will appreciate their ease of operation and the good work they do.

UPPER WISCONSIN

Three-Year Crop Rotations For Upper Wisconsin.

(Continued from last week.)

A three-year rotation, popular with many of the best dairy farmers, consists of small grain seeded to clover, clover and corn or some other cultivated crop. Much the larger proportion of the corn is cut for silage to be fed to dairy animals. The clover is made into hay and fed to stock.

As it usually produces two crops in one season, medium red is the most profitable variety of clover to grow on the richer soils. The second crop may be cut for hay or for seed or may be pastured. Pasturing is advisable on well-stocked dairy farms.

Some successful dairymen pasture the first crop of clover for about two weeks in early spring or until June 10th. This retards, somewhat, the time of cutting, but does not greatly affect the yield. Part of the small grain crop should be allowed to ripen and the rest cut for hay. In most localities it probably will be most advantageous to use oats as the small grain in the rotation, although barley, rye and wheat can also be grown for that purpose.

This rotation is the dairyman's best rotation. It provides a good supply of leguminous hay and plenty of silage. Whatever small grain is raised should be incidental to seeding down to clover. In no case should the grain be allowed to ripen if doing so is likely to prevent a good seeding of clover. When clover fails to "catch," some other leguminous crop should be substituted for it. Soy beans are good for this purpose. Yields of from one to three tons of cured hay have been obtained on sandy soils at the branch experiment stations. Peas and oats, mixed, also make excellent hay and are valuable substitutes for clover, particularly on the heavier loams and clays.

On farms where this rotation is used it is possible to keep a great deal of stock. Several farmers in Upper Wisconsin are, under these conditions, now keeping the equivalent of one cow to the acre. In such cases much manure is produced and the most convenient and profitable place to apply it is on land intended for corn. Where there is difficulty in getting clover to "catch," it is well, so as to help the young clover, to apply the manure to the small grain crop. A third method is to apply manure on the new clover in the fall or winter.

This rotation, by increasing the supply of nitrogen and humus, will improve the productivity of most Upper Wisconsin farms. No special portion of the land is devoted to pasturage in this scheme of farming. The spring sown, as well as the second crop of clover, may be fall pastured. It is presumed that some waste, or but partially cleared land is in permanent pasture, and that sufficient corn silage is produced to have a supply for summer feeding when needed.

The three-year rotation can be made into a four-year rotation by leaving the clover for two years and pasturing the field the second year. In this case a small amount of grass seed, such as timothy and orchard grass, should be sown with the clover. This is a good rotation and is also well adapted to maintaining the productivity of the soil.

Of course, one or more crops of different kinds, but of the same class, may be grown in the same stage of rotation. For instance, the small grain crop may consist of rye, oats, wheat and barley instead of any one of these alone. Where twenty acres or less are put into grain crops time is saved, of course, to sow but one or two kinds of grain. The same is true of the cultivated crops. Root crops may be grown profitably on most farms and in the same stage of rotation as corn. If soy beans are grown for hay the land may, in many instances, be sown to rye immediately after the beans are harvested.

In this rotation manure, as a rule, is applied to the cultivated crops. Where the soil is low in fertility, all crops except peas should be fed on the farm. If the land has been heavily cropped to peas and small grain, it may be necessary to use some phosphate fertilizer.

Three-year rotation for a dairy farm. The farm is divided into three fields and each year the same crops are grown, but changed from field to field.

Bennie Keen, of Langlade county, and the pure-bred Holstein bull calf which he won as first prize in the boys' judging contest at the 1915 Langlade County Fair.

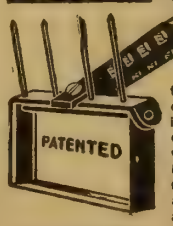
Cup For Best Wheat.

New countries are developed to a large extent by the progressive land men who bring in the settlers and stand by them until they can get a start. The Wisconsin Farmer is pleased to note in this connection that the Farmers' Land & Cattle Co., of St. Paul, through its Douglas county representative, John Greiff, is endeavoring to interest farmers in better wheat by offering a silver cup, a picture of which is herewith reproduced. This cup is to be awarded to the farmer raising the best half bushel of wheat in Douglas county, Wisconsin. The contest covers three growing seasons and the cup is to become the property of the farmer who has the best wheat three years in succession. No particular grade of wheat has been specified. The field from which the half bushel is taken must contain at least one acre. The Douglas County Fair Association has the contest in charge and has authority to make conditions.

FOR BEST DOUGLAS COUNTY WHEAT.

Last year Wisconsin had a bumper apple crop. Most sections in which this fruit was grown had many more apples than could be utilized locally and so hundreds of bushels went to waste. Due to lack of attention in preventing infection by fungous and insect pests, a considerable amount of the fruit was lost because it was not of a character that could be placed upon the market. The time is past in Wisconsin when we can expect to produce fruit which is suitable even for home use without giving it this care.

AGENTS Make Money Fast With GILSON WEEDERS



THIS new, two-in-one tool takes the place of the hoe; does better work, easier, and four times as quick. Saves time, labor and money in field, truck patch, garden or flower bed. Sells on sight--everybody wants it. Nothing like it on market. Now's the time to clean up on this big money-maker. Get in quick. Liberal commissions. Write for circular and agents' proposition.

J.E. GILSONCO., Dept. 18 Pt. Washington, Wis.

DAIRY

Record-Breaking Two-Year-Old Holstein.

Another record in the dairy world has been broken and a new world's two-year-old champion has been crowned. We refer to the record made by Beauty Girl Pontiac Segis, owned by the Arden Farms, St. Paul, Minn. The following is her official record at two years and twenty-nine days.

Butter, one day	4.242 lbs.
Milk, one day	77.1 "
Butter, seven days	28.73 "
Milk, seven days	507.4 "
Butter, fourteen days	56.574 "
Milk, fourteen days	1,018.3 "
Butter, thirty days	116.478 "
Milk, thirty days	2,088 "
Butter, sixty days	218.624 "
Milk, sixty days	4,041.5 "

Beauty Girl Pontiac Segis, sired by King Segis Pontiac Count, a grandson of King Segis and Pontiac Clothilde De Kol 2d. He is a three-quarter brother to the $50,000 bull, King Segis Pontiac Alcartra. The records of his dam and sire's dam are: Butter, seven days, 33.12; butter, thirty days, 33.93; milk, one year, 23,773.90; butter, one year, 1,157.44. With respect to the average yearly butter record of his dam and sire's dam he surpasses every other sire in service. He combines in the closest degree the blood of King Segis, Pontiac Korndyke and Hengerveld De Kol. His dam, K. P. Lilith Clothilde, was the best yearly record daughter of King of the Pontiacs, and the world's record junior four year old for a year's production of milk and has the second largest year's butter record in her class. She is a sister to the only forty-four pound cow and to the greatest lot of semi-officially tested heifers ever credited to any one sire.

KING SEGIS PONTIAC COUNT.

BEAUTY GIRL PONTIAC SEGIS.

Uniformity of the Dairy Herd Desirable.

J. A. R., Wisconsin, is losing cream in the process of churning. This inquirer writes:

We keep Jerseys, Ayrshires and a couple of Short-horns in our herd. The cream tests 39 per cent and the milk 5.2. The cream is made into butter at a temperature of about 65. When the buttermilk is drained off it is thick with cream that does not seem to quite break into butter. What is the trouble, and what can be done to remedy it?

There are several causes for the trouble mentioned, the most common being a wide difference in the breed of cattle, the length of the period of lactation and the lack of uniformity in the acidity of the cream. Also, if the cream is churned at a temperature too high, some loss is experienced in butter, though it would not seem that this applies to our inquirers' problem.

Sour and sweet cream should never be mixed just before churning. It requires longer for sweet cream to break, and in the interim the sour cream becomes butter, leaving the other in the milk, with the result that our correspondent mentions. Each time that sweet cream is added to the jar the whole mass should be carefully stirred so that it is well mixed. One woman who makes very superior butter says that this is the prime factor in her success. She does not count the care in sterilizing and all the rest of it that goes with the dairy; that is considered as a matter of course.

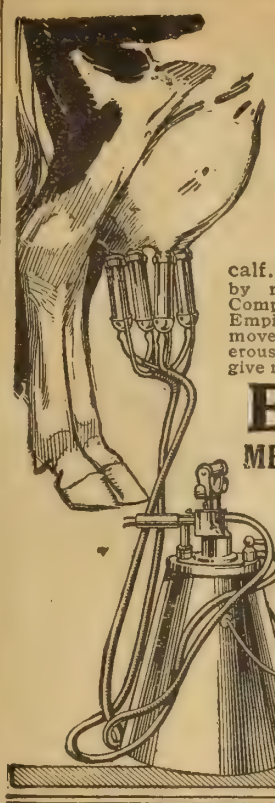
As the cows become advanced in the period of lactation, the milk becomes more adhesive and the globules smaller, and as a rule somewhat harder, causing trouble in getting the butter to gather. However, this trouble is for the most part overcome by having fresh cows in the herd. Much more trouble is experienced in the late winter when the cows are on dry feed, and sometimes disappears to an extent with the coming of grass or other succulent feed. Carelessness in the matter of salt often gives the farm dairyman trouble. Unless there is a supply where the cows have access at all times they rarely get as much salt as they really require.

Unless one understands the why of it, it would seem ridiculous to say that the different breeds in a herd could have any bearing whatever. The basis of this cause is the fact that large globules unite readily, while the smaller ones do not, and are lost. The Jersey cow's milk contains the largest globules of all, and is, therefore, the easiest to churn from. The Short-horn is medium and the Ayrshire contains the smallest fat globules of all. In the process of churning the dairyman in question very probably gets all of the fat from the Jersey, while some is lost from the Short-horn and much from the Ayrshires. It is always the small globules that pass off in the buttermilk.

When the writer began to care for cream after years spent at something else, the Jersey had supplanted the common cow of the earlier time. With the former, if the butter when through churning was firm enough and abundant enough to "hold up the dash," that cow was a wonder. It was a long cry from such condition to that of the dash getting imbedded in the thick, thick cream, so much so that it was impossible to longer "work the dash."

This subject is one that rarely troubles the dairyman who sells cream instead of churning, and the result is that it rarely is discussed. In this case it would be advisable to churn at a slightly lower temperature, about 60 degrees. A starter would be undesirable. It is not convenient for the farmer to use a commercial starter, but he can easily prepare one for his own use. This may be done by keeping a small quantity of milk in a small vessel until it sours, adding it to the cream, or what is equally as desirable, adding a small quantity from the last churning. Don't you remember when your mother used to place the fresh cream in the jar before it was washed, when the weather was so cold that it was difficult to get the cream ripened? It is exactly on the same plan, and it was not carelessness, neither unsanitary, either, though using a small quantity of the cream and sterilizing the jar is better.

After all that's said and done, the real trouble lies in the fact that the fat from the different cows varies so widely in the matter of viscousness that the fat fails to unite at the same time. The better plan is to keep the herd uniform. Until that time try churning the cream at a density of about 30 per cent.



Just Like a Sucking Calf

THE Empire way is the natural way. The milk is drawn in spurts as by a sucking calf. This action is produced by natural atmospheric pressure. Compressed air is harsh, irregular. Empire milking is a gentle, uniform movement that cows respond to generously. They stay fresh longer and give more milk.

EMPIRE
MECHANICAL MILKER

One double or two-cow unit takes care of 20 to 30 cows per hour. One man can operate two double units. No costly or elaborate installation. Only one tank—only one pipe line. Operation is simple and economical. Install the Empire and make your dairy modern, efficient, profitable, sanitary—money-making and labor-saving.

Write for description and pictures showing Empire Milker and Empire Separator in modern dairies. Get our offers on Empire Gasoline Engines and Empire Star Feed Mills. **Ask for Catalog No. 56M**

Plumbing For the Farmhouse.

The introduction of running water with a satisfactory plumbing system makes it possible to secure a greater degree of comfort for the housewife in the performance of her duties as well as personal cleanliness for each member of the family. It costs no more to put water into a farmhouse than it does in a city house and every farm family, if they do not already have this convenience, should plan to make a plumbing system the next improvement about the place.

The plumbing itself should be open and simple. The old method of enclosing the pipes in wood is not to be thought of for a moment. Let the pipes show. Then any damp or dark places around the sink or bath tub may easily be detected and remedied at once. Those dark and damp places are the abode of disease germs and strict attention to all such matters is a great factor in the health of the family.

The accompanying illustration is a good example of the open plumbing under the sink. There is nothing here that cannot be seen at a glance so that there would be absolutely no excuse for any dangerous lurking place for dirt and disease.

The best location for the sink is under or near a window. The sink here shown is just at the right of the window, a shelf occupying the space just beneath the window. This is a good arrangement for dish washing. Also, the sink should be near the cupboard or cabinet where the dishes are kept so that many steps will not be required to put them away after washing. White enamel is the best material for the sink. It is easily kept clean and presents an attractive appearance.

The height of the sink from the floor is not one of the least things to be considered. It should be at a distance from the floor that will allow the worker to stand erect. For instance, for a woman five feet two inches tall the sink should be twenty-seven inches from the floor, or for one five feet four inches tall about thirty inches.

And while you are putting in the water system don't forget to make ample provisions for hot water, both for the kitchen and the bath. In the winter this can be supplied by the heating plant, but for summer a small laundry stove with heating coils will furnish plenty of heat. The satisfaction to be had from turning on a faucet of hot water is not to be compared with any other convenience in the kitchen or bath.

Will Mrs. J. D. Write Again?

To the Editor:—Will the lady, Mrs. J. D., who found relief from headaches in osteopathy please state how many treatments she had to take and whether she was troubled with sick headaches or just a common headache? I am subject to sick headaches and have tried everything, even osteopathy. I took fifteen treatments, but only found relief while taking them and when I stopped I had them just as hard as ever.

I am sure that there are others besides myself who would like to hear more from Mrs. J. D. Mrs. W. B.

Directions For Smocking.

One of our subscribers has asked for directions for smocking, and, as this is a popular trimming at the present time, we are glad to comply with her request.

Mark your material with small dots from three-eighths to one-fourth inch apart. Then take up the material at these dots with small stitches on the right side of the material. Run the threads along on each line of dots until you have your material all gathered. Then fasten the threads at the end, leaving the material the correct fullness or width desired. This will make smocking very easy. All that is necessary is to follow along the dots with the various stitches which you desire to use. All work starts at the left side and works toward the right.

The material required for smocking usually averages about one yard for every twelve inches of smocked goods, varying somewhat according to the design used.

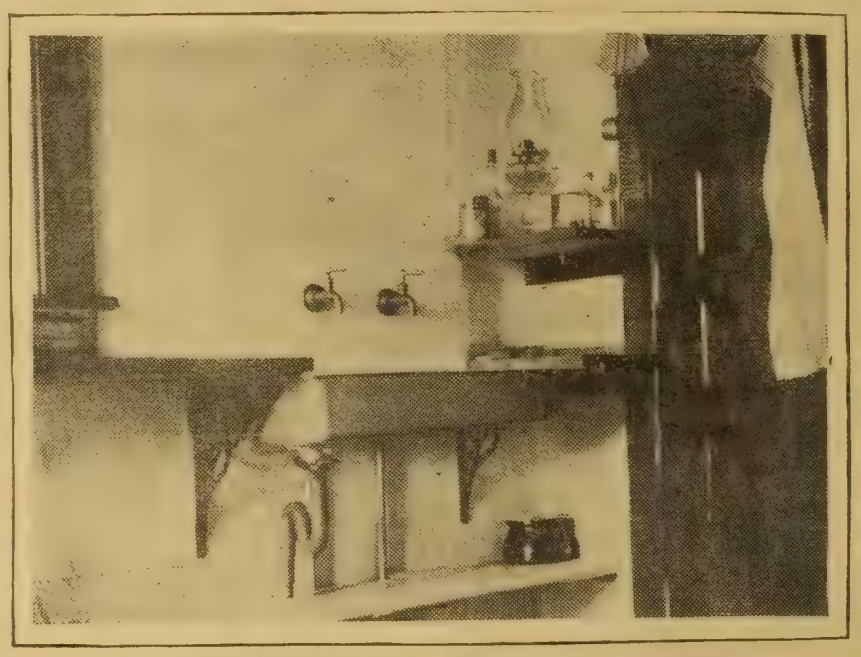
Single Cable Stitch: In making this stitch one must follow the gathering thread and keep the work perfectly straight. Begin with the thread on the first pleat on the wrong side of goods and bring the needles up on the right side. Work from left to right and keep the thread above the needle in the first stitch and below needle in the second stitch, then above needle in the third stitch and below needle in fourth stitch, etc., continuing in this manner to end of row.

For double cable stitch work the row of single stitch, keeping it slightly above the gathering thread, then work another in the same manner, keeping it below the gathering thread, but reversing the order above needle and below needle. That is, if the first row is started with thread above, the next row should start with thread below, etc.

Wave Stitch: Begin on first pleat at left hand. Insert needle from wrong to right side of material with thread above needle, take four stitches in the next four pleats, grading them down and ending on the second gathering thread. With thread under needle take four stitches in the next four pleats, grading upwards and ending on first gathering thread. Continue in this manner across with thread above needle and under needle alternately each four stitches.

Diamond stitch is made by using two rows of this wave stitch, with the points meeting forming a diamond in the center.

After all smocking is finished the original gathering threads should be pulled out.



SIMPLE BUT CONVENIENT ARRANGEMENT FOR SINK.

When Sickness Comes to the Farm Home.

Often the recovery of health depends in a great degree on the food furnished to the convalescent and so this is a subject of vast importance to those who have the care of the sick. The food should be so served that it will appeal to the sight, as the appetite is often entirely gone and it must be stimulated. Foods furnished to the sick should be delicate, delicious, attractive, and, more important, digestible and nutritious.

If a diet of milk is ordered it need not follow that it should always be served in the same dish or in the same form. Always under the physician's direction milk may be served in junket form, in koumis, as bulgarzoon (a sour milk that is particularly liked by those who enjoy buttermilk), and in custards or egg nogs—thus a great deal of nourishment may be given.

It is necessary that a nurse understand the food principles, be able to furnish variety, and, above all, make a dish taste and look well.

When preparing a meal for a patient have the tray all ready with the prettiest dishes the house affords and let the tray be roomy enough to hold all necessary dishes. When serving hot food to a patient see that he gets it fresh and hot. The amount to serve is worthy of consideration. Too much is often discouraging and it may even cause nausea, while the proper amount is attractive.

Any food becomes distasteful if always served in the same form. Variety is indeed "the spice of life" to an invalid, for his life is rather plain and uneventful, so that a surprise of some dainty dish will please him wonderfully. Care should be taken that all foods like fish or flesh should be perfectly good, for often a slight change in meat that a well person would not notice will cause digestive trouble with an invalid.

Fish is a food which rapidly deteriorates and the nurse should herself pick out such food and see that it is in prime condition before offering it to her patient. Meat and fish will spoil very quickly if left standing in a warm kitchen.

When a liquid diet is used entirely a variety of ways of serving milk will be found helpful by adding limewater, acid preparations as rennet or junket tablets, wheys, broths of milk, cream soups using oysters and clams for variety when obtainable. Gruels are most valuable and should be well cooked and carefully made. For oatmeal gruel use a tablespoonful of oatmeal to a pint of boiling water and a quarter of a teaspoonful of salt. Let this cook for an hour or longer. When ready to serve add as much milk as gruel.

Lemon Whey: Add one-half tablespoonful of lemon juice to a cupful of hot milk. Heat until a clear whey is seen, then strain, add sugar to taste and serve.

Chicken Broth: Cut up a hen as for stewing, put the bony pieces in the bottom of the kettle and the breast on top. Cover with cold water and cook slowly four hours. Pour off the broth and let stand to chill the fat. Remove the fat and serve broth with a little cooked rice all heated until hot.

Dessert for an Invalid: Heat in a double boiler a quart of fresh milk; when hot add a teaspoonful of salt and a third of a cup of cream of wheat. Let cook one-half hour, stirring occasionally the first fifteen minutes. When the cereal is cooked pour it over one egg beaten until light and two tablespoonfuls of sugar and stir until well blended. Serve hot or cold with cream or fresh fruit.—Nellie Maxwell.

Death to the Bugs.

To the Editor:—I am writing this for the benefit of the subscriber who had trouble with bedbugs.

Remove every picture, tear off all the paper that is loose, cork doors and windows up tight so fumes cannot get out and put a couple of pounds of rolled brimstone in an iron kettle and set it on fire. It will draw into all the cracks and kill both bugs and nits. If the whole house is affected put two or three kettles in different rooms, some upstairs, some down, closing all outer doors and all windows. Seven pounds will clear a whole house. You might have to repeat the operation if the bugs were more than thick, but I doubt it. The brimstone will burn all day.

Don't use sulphur, because it doesn't burn long enough and is not strong enough.

The fumes will tarnish any silver or other metal, so remove everything of this kind. This will have to be done on some day when the family can be away or out-of-doors, as the house must be kept tightly closed. So much the better if it can remain closed all day and night. A Reader.

Another Method.

To the Editor:—To get rid of bed bugs tear all the wall paper off you can. Then take equal parts flour and salt for paste. Boil until you have a good paste. Into some of the paste put cayenne pepper. I also put in some carbolic acid. Then rub this paste into all cracks and crevices. I always strip the cracks with old window shades torn in strips about two inches wide.

If the bugs bother on the beds either paint or varnish the bedstead. After this treatment I don't think there will be any more trouble. R. A.

Poisoned 'Em.

To the Editor:—In a recent issue a subscriber asks for help in ridding a house of bedbugs where they are in the walls. Having had that to do at one time where the walls were plastered, I put two ounces of corrosive sublimate in a large pitcher and poured boiling water over it which soon dissolved the poison. Then saturated every place where the bugs were with this solution, killing both bugs and eggs. This was eighteen years before formalin was heard of.

Now, I am told if formaldehyde is put in the paste used in papering a bug will never be seen again. On compo board or any walls made of wood, tack tar felt on and cover with wall or building paper and you will be rid of the bugs. Tar paper on roofs of henhouses will keep away bugs and also mites and hen lice.

Mrs. B. H. J.

Pointers.

Don't add the flavoring to soft custard until the custard is cold.

A small piece of window glass is useful to hold the leaves of the cook book apart, so that one can read a

recipe and not soil the book by handling.

It is a good plan to line the clothes basket with oilcloth, as it can then be kept perfectly clean.

A little vinegar added to the furniture polish will add greatly to the brilliancy of the article polished.

Blotting paper on medicine cabinet shelves reduces the noise of handling bottles and absorbs spilled medicine. It can easily be replaced when soiled and if white is used your cabinet always looks immaculate.

A Suffragist For Fifty Years.

Dr. Anna Manning Comfort, fifty years a practicing physician and a pioneer in the suffrage movement as well as in her profession, was recently entertained at an anniversary dinner by the trustees of the New York Medical College and Hospital for Women, from which she graduated in 1866. Dr. Comfort was the first woman to practice medicine in Connecticut and when she graduated she was the youngest medical graduate in the world.

Recipes.

Cinnamon Tea Biscuit.—Two cupfuls flour, one-half cupful sugar, two eggs, one-half cupful butter, one-half teaspoonful ground cinnamon. Sift the dry ingredients together, with a few grains of salt; rub in the butter and mix to a stiff paste with the eggs. Roll out thinly, cut into rounds and bake fifteen minutes.

Raisin Pie.—Take one pound of raisins (washed and seeded), turn over them one quart of boiling water, and boil until tender. Keep adding water so there will be a quart when done. Grate the rind of one lemon into a cupful of sugar, three tablespoonfuls of flour and one egg. Mix well together, turn the raisins over the mixture, stirring all the while. This makes three pies. Bake in double crusts as other pies.—N. M. T.

Dumplings With Meat.—To each cup of flour add two teaspoonfuls of baking powder, a pinch of salt and just enough water to make a mixture very hard to stir with a spoon. Butter steamer and place over a kettle of boiling water. Drop a tablespoonful of the mixture on a place and steam twenty minutes without taking off the cover. Take out and put into your meat gravy and let stand a minute or two. To be eaten immediately. These are never heavy.—G. D.

Jellied Salmon Salad.—One pint canned salmon, drain and remove skin and bones. Mince fine, add tablespoonful lemon juice, dash of pepper, teaspoonful minced parsley and salt to taste. Mix together and bind with any desired salad dressing and one tablespoonful powdered gelatine dissolved in one-fourth cup of water. Fill small molds and set on ice to chill. Turn out on crisp lettuce leaves. Garnish with olives and serve with mayonnaise.

Chocolate Cups.—Make a plain custard, using one quart milk, three eggs, six tablespoonfuls sugar and a pinch of salt. Flavor with a square of chocolate scraped and melted, and bake in custard cups. Chill thoroughly and just before serving scoop a spoonful from the center, replacing with whipped cream.

FILET CROCHET
100 DESIGNS
In Book Form

This book contains over one hundred of the most beautiful, practical, prettiest, newest and oldest designs of Filet Crochet and Cross Stitch ever published.

This Splendid, Handsomely Illustrated Book includes everything from the simplest to the most intricate and exquisite designs.

Yokes and Towels

With the beautiful illustrations and simple instructions all designs can easily be worked by novice or expert.

Complete Book, Including Postage and Packing Only 12c.

THE YOUNG FOLKS

All letters from boys and girls to this department should be sent to office of The Wisconsin Farmer, Madison, Wisconsin.

The Bell of Justice.

Dear Young Folks:—I have been reading your letters and enjoy them very much. I am thirteen years old and live on a farm. I thought I would write one of my favorite fairy tales. It is called "The Bell of Justice."

Once upon a time in a country of the old world there lived a good king named Nemo. He was very good, always looking out for the good of his people. One day he thought his people were getting rather quarrelsome and he decided to try to prevent it. So after a while he thought of a plan.

He called the people to the old church on the hill, and when they got there he said:

"I have watched my people and have noticed your defects. I thought I would try to remedy it. I have had a bell made—a large, bronze one, the largest ever made—and I am going to put it in this church tower and a large, long rope is going to be tied to it. This shall be called the bell of justice, which means that everyone who has a wrong done to him may come and ring the bell and some of my judges shall come and hear the complaint anyone has to put in."

The plan worked well after that. The people all liked it. After many years the old king died and his son

GEORGE HOWARD WILLIAMS.
This is a really, truly fresh air baby, having slept for the first six weeks of his life in a new house where the windows were not yet in. He is the son of Mr. and Mrs. H. Williams.

ruled. The new king was just like his father, a very good, kind king.

Not long after he was made king the bell rope broke. They put another in its place, but it was old and rotten. The bell rope had to be so long that few ropes could be found for it. So when the second rope broke they could find none to take its place. The country was very dry and the grasses and trees were not green, but dried up and brown. Finally an old farmer said that he had an old grape vine that could be put on the bell. They put this on and it worked very well, except that it was rather short and the people could just reach it. Still it served the purpose.

Now the people in the town were not all alike and some were very wicked. There was one old man who lived on the edge of town and whom the people did not like and did not have much to do with. He was a miser. Old and rich, he lived on a farm. When he was a young man he had been in the king's service. He had fought for the king in a war with a distant country and had been so faithful that he had received much money for his services. With this money he bought a farm on the edge of town and there he settled. As he kept making money faster and faster he began to think much of it. After a while he began to love it more and more and he got very greedy for it and then turned into a miser.

While in the war he had been given a young horse. The horse and master were always together and loved each other, and many times the horse had saved the life of his master when in danger in the war.

When the war was over the master took his horse home with him and for many years kept him and loved him. After he became a miser he gave the poor horse less and less to eat and sometimes the poor fellow went without for many a day.

One day the master came out to the stable and told his horse that he could not afford to keep him any more and that he must go.

The horse went. He was very hungry and there was nothing to eat. The pastures were dry, the weeds were gone from the roadside and the leaves were gone from the trees. He went along the road for many miles but could find nothing. Finally he came to the town. The sun was very hot and he was very thirsty. He could scarcely walk, but he hobbled along as best he could.

Many people looked at the poor old horse as he dragged along, and felt very sorry for him. On he hobbled to the church and there he saw the grape vine. He straightened up and dragged his tired legs along a little faster.

When he came to the grape vine he ate it ravenously, and when it got pretty high for him to reach he heard a stronge noise. Every time he took a bite something strange rang overhead.

The bell was ringing. Yes, the bell was ringing to tell the judges to come and give justice to this poor old horse.

By and by the judges came and the king came with them. When they saw nothing but the old horse they were very angry and wanted to turn back immediately. But the king saw the horse and recognized it, for he had seen it many times. He knew what the miser was like and he knew that he would give his horse no food. So he told one of the judges that he should go and get the old miser that lived on the edge of town.

The miser was brought and they made him tell his story. After the king heard what he had to say he said:

"The horse has come here and asked for justice and he shall have it. My father put this bell here and said we should always respect it, so now I am going to have you make your choice between having all your money taken away or keeping your horse comfortable all the rest of his life."

The miser went home and took his horse with him, for he did not like to see the horse go, and he wanted his money.

The people who had seen all this went to their homes better people and thanked God for their good king.

I hope all the young folks will like my favorite story. —Hilda.

Loves the Country.

Dear Young Folks:—I like to read your letters every week. We used to live in St. Louis but last summer we moved out in the country. We have three horses, some cows and some sheep and a little pet lamb. Mama has 125 little chickens and they are such cute little things. I am eight years old and have a mile to go to school. I go every day and I have a nice teacher. We live three miles from town and I love the country very much.

AT THE PARK.
Bernadine with her brothers and little sister.

I am sending you my picture with my brothers and little sister. It was taken last summer at the park in St. Louis. —Bernadine.

OUR FASHION DEPARTMENT.

ALL PATTERNS, 10 Cents Each.

THIS department is prepared especially for The Wisconsin Farmer. We can supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10 cents each, postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering, all you have to do is to write your name and address plainly, tell us the correct number and size of each pattern you want and inclose 10 cents for each number. We agree to fill all orders promptly and guarantee safe delivery.

CATALOG OF SPRING AND SUMMER FASHIONS.

Send 10 cents in silver or stamps for our up-to-date 1916 large spring and summer catalog, containing over 400 designs of ladies', misses' and children's patterns, as well as the latest embroidery designs, also a concise and comprehensive article on dressmaking, giving valuable hints to the home dressmaker. Address all orders for patterns and catalogs to THE WISCONSIN FARMER, MADISON, WISCONSIN.

1633—Ladies kimono sack (in either of three styles). The pattern is cut in three sizes: Small, medium and large. It requires 2¼ yards of 44-inch material for a medium size.

1652—Girls' dress, with sleeve in either of two outlines. The pattern is cut in four sizes: 4, 6, 8 and 10 years. It requires 2¾ yards of 44-inch material for a 6-year size.

1685—A set of new collars. These styles are good for coats or dresses, and much in vogue this season. The pattern, including all styles is cut in three sizes: Small, medium and large. It requires for either style, ⅜ yard of 22-inch or wider material for a medium size.

1504—Ladies' combination camisole and envelope skirt drawers. The pattern is cut in three sizes: Small, medium and large, and requires 3¼ yards of 36-inch material for a medium size.

1637-1657—A trim and attractive business suit. Composed of ladies' shirt waist pattern 1637 and ladies' skirt pattern 1657. The waist pattern is cut in six sizes: 34, 36, 38, 40, 42 and 44 inch bust measure. It requires 2¼ yards of 44-inch material for a 36-inch size. The skirt is cut in six sizes: 22, 24, 26, 28, 30 and 32 inches waist measure, and requires 4 yards of 44-inch material for a 24-inch size. Two separate patterns 10 cents for each pattern.

1535—Ladies' overall apron. The pattern is cut in three sizes: Small, medium and large. It requires 6¼ yards of 36-inch material for a medium size.

1581—Costume for misses and small women (with sleeve in either of two lengths). The pattern is cut in three sizes: 16, 18 and 20 years. Size 16 will require 6⅜ yards of 36-inch material.

1655—Juniors' dress, with or without bolero, with sleeve in either of two styles and with round or square neck edge. The pattern is cut in three sizes: 12, 14 and 16 years. It requires 5 yards of 44-inch material for a 16-year size: without the bolero it will require ¾ yard less.

1690—A dainty summer frock. The waist fronts are lapped at the closing. The pattern is cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. It requires 8½ yards of 44-inch material for a 36-inch size.

1675—Girls' dress in surplice style, with two styles of sleeve. The fullness of the fronts at the shoulders is caught under tab extensions of the back. The pattern is cut in four sizes; 6, 8, 10 and 12 years. It requires 3¼ yards of 44-inch material for an 8-year size.

1588—Girls' dress in one-piece style with sleeve in wrist or elbow length. The fullness of the dress is held by a belt. The pattern is cut in five sizes: 4, 6, 8, 10 and 12 years. It requires 3 yards of 44-inch material for a 6-year size.

1547—Ladies' home or morning dress, with sleeve in either of two lengths. The pattern is cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. It requires 5⅝ yards of 44-inch material for a 36-inch size.

POTATOES AND SEEDS ALMOST GIVEN AWAY.

International Sunday School Lesson.

Lesson for April 30, 1916.

(By E. O. SELLERS, Acting Director of Sunday School Course.)

PETER DELIVERED FROM PRISON.

LESSON TEXT—Acts 12:1-19.

GOLDEN TEXT—The angel of Jehovah encampeth round about them that fear him, and delivereth them.—Psalms 34:7.

One day the "sons of Zebedee" desired Jesus to grant a carte blanche petition. Pressed further as to their particular request, they petitioned for the seats of authority on the right and left hand of Jesus in glory. In reply Jesus said that such a petition was not a proper one nor intelligently asked, but according to their intrepid assertions of willingness they should be baptized with his baptism of death (Mark 10:35-45), and that the greatest of his followers should be "servant of all." Today's lesson is a fulfillment of that prophecy.

I. Peter in Prison, the Church Praying (vs. 1-6). Persecutions had been resumed (9:31) after a temporary lull. Some people serve Christ by living, others by yielding up their lives for His sake. James (not the one mentioned in chapter 15) was slain and Peter's death delayed in order not to pollute the feast of the Jewish Holy week. Peter's position was perilous. Sixteen soldiers guarded him in a Roman dungeon. But his enemies had left God out of their calculations and the believers had linked themselves through prayer with the source of all power. Against such a force Herod's cunning plan, whereby he might curry favor with the Jews (v. 3), is powerless. But it is now almost the hour for Peter's execution. Why the delay? The greater to demonstrate the power of God. Herod and the Jews cared not for, nor recognized, Easter, but God cared for His servant and honored the prayers of His saints. Peter's faith in the plans and purposes of God is indicated by his slumber and the need of being fully awakened by the angel. There are four things about that vigil of prayer (v. 5) offered by the church on Peter's behalf, which was so wondrously answered. (1) It was directed "unto God." Some prayers are offered to audiences or the ears of man, but not such as are answered. We have heard prayers, so-called, offered where the name of Jesus is never mentioned, and scarcely the name of God. Literally (v. 5) this was a "stretch-out-ed-ly" prayer, and its earnestness was such as to circumvent this vile grandson of Herod the Great. (2) It was made "without ceasing" ("earnestly" R. V.). There was a sincerity and an intensity of desire on Peter's behalf which language can scarcely express (See also Rom. 8:26). The same word is used of our Lord's prayer in the garden when "His sweat was as great drops of blood falling down to the ground." (Luke 22:44, Rome. 15:30, Col. 4:12, 13, R. V.). There is little such prayer to be found, but once found it is answered.

II. Prayer Answered, Peter at Liberty (vs. 7-11). The messenger of God (v. 7) brought light, yet the servant of God needed awakening, a suggestion to apply to our modern church life. His method of awakening Peter suggests that it often takes sharp blows to arouse us to our duties and privileges. The sinner has to be awakened before he can be delivered. Deliverance is more needed than sleep.

III. Joy and Amazement (vs. 12-17). Peter, finding himself untrammeled and free upon the streets of the city, and no longer angel-accompanied, at once repaired to his friends. Do we seek the prayer meetings? It was startling indeed for the subject of their prayers to knock at the door; perhaps he should have been more considerate of their feelings. One, Rhoda, readily responded, and it was her persistent faith that finally overcame the lack of faith on the part of the others. While they were yet speaking God had answered (Isa. 65:24), but such a prompt and complete deliverance was not expected, and it amazed and bewildered them. Rhoda seemed to be expecting Peter, for as soon as she answered Peter's rap at the door she recognized his voice (v. 14), and from sheer joy over the good news she was able to communicate it to those praying, but she neglected the important duty of opening the door for Peter. She was only a "ma'd" and her message was but foolishness (Luke 24: 11), which her elders sought to explain, but poor Peter still outside, "continued knocking," which soon convinced those within, and upon opening the door they "saw him" and were "astonished."

Calming their fears and admonishing them to hold their peace (v. 17), Peter turned their thoughts from himself to Jesus and commanded that James, the leader of the Jerusalem church, and "the brethren," be informed of his deliverance.

Meanwhile he went to "another place."

Herod when he sought to execute Peter according to his plan (vs. 3, 4) was angered at the turn of events, vented his wrath upon Peter's guards (v. 19), and in seeming disgust and dudgeon over the escape of this great leader, retired to his capital, Caesarea.

30 VARIETIES PRIZE-WINNING GEESE, ducks, turkeys, chickens, pea fowls, guineas. Stock; eggs cheap. Write wants. F. J. Damann, Farmington, Minnesota.

MAMMOTH BRONZE turkey eggs 25c each. Single Comb Brown Leghorns, $1.00 for 15. $4.00 for 100. Mrs. Peter Milfried, Cazenovia, Wis.

SILVER Laced Wyandottes, Barred Plymouth Rocks and White Crested Black Polish. Eggs for hatching. Cascade Poultry Yards, Cascade, Ia.

S. C. W. Leghorns, Wyckoff strain, chicks, eggs. Prices right. Flock headed from 288-egg strain. Mrs. Mollie Wachendorf, Monroe, Wisconsin.

PARTRIDGE and BARRED Plymouth Rocks. Eggs from choice pens of Partridge and Barred, $2 per setting. Dr. O. R. Rice, Delavan, Wis.

EGGS FOR HATCHING. Pure R. C. Rhode Island Reds, $1.25 per 15, $5.00 per 100. Address Fred M. Smith, Route 7, Elkhorn, Wis.

SINGLE Comb Buff Leghorn eggs from high-class stock at $1 per 15, 100, $4.50. Chas. Ichmit, R. 22, Hortonville, Wisconsin.

MY R. C. REDS ARE MONEY MAKERS. Eggs postpaid, prices right, circular free. Mrs. G. Ellis, West Salem Wisconsin.

POULTRY DEPARTMENT

THIS department is edited by a competent poultryman, who will be pleased to answer questions concerning disease, poultry management, etc., when they can be answered through the department. Questions will not, however, as a rule, be answered by mail, and stamps need not, therefore, be inclosed with inquiries. Address all letters relating to poultry topics to this office.

Handling Young Chicks.

Chicks need no food from two to three days after hatching. They should be kept warm. During the first week the temperature should not fall below 95 degrees and during the second week it should be held up to 90 degrees. When they crowd under the hover of the brooder it is a sign that they are cold. Fifty chicks are enough for one brooder. When too many are put together they sometimes pile on top of each other and some smother. When the chicks are forty-eight to sixty hours old feed them equal parts of bread crumbs and oat meal to which add a little chick grit. Feed four or five times a day and only what they will eat up in a few minutes. After the third day feed a good quality of chick feed. Sprinkle it in the litter, which should be made up of a thin layer of short-cut alfalfa or fine straw. A homemade chick feed can be made as follows: Cracked wheat, twenty-five pounds; fine screened cracked corn, twenty pounds; pinhead oat meal, ten pounds; crushed peas, three pounds; millet seed, two pounds, and fine charcoal, three pounds. Keep grit, charcoal and water before them all the time. After the first week begin giving beef scraps in small quantity. Feed sparingly at first, one ounce for forty or fifty a day. Provide green food; sprouted oats are best. Mangels, green clover and lettuce are also good. When on open range the grass will answer. After the chicks are two weeks old a mixture of equal parts of wheat bran and beef scraps may be kept before them all the time. When four weeks old the following mash mixture can be fed in hopper: Equal parts of bran, corn meal, wheat middlings and rolled oats to which add 10 per cent of meat scraps. When the chicks are six weeks old ground oats may be used in place of the rolled oats. And when six weeks old the chicks' feed can be discontinued and equal parts of wheat and cracked corn fed in its place. Keep the mash before them in hopper.

Meat Ration For Birds.

Some form of meat must be fed the chickens in the breeding season. These are to take the place of the grasshoppers, worms and bugs that are obtained in late spring and summer. Fresh meat scraps are good, but are hard to supply regularly without becoming tainted. Fresh cut bone is very good. Prepared meat scraps that are dried can be bought on the market. This is in a form so it will keep. —[E. J. F., North Dakota Experiment Station.

Making Bordeaux.

There are a number of ways of preparing Bordeaux mixture. The following method has given good results in work carried on by the Wisconsin Experiment Station:

Blue vitriol (copper sulphate)	8 lbs.*
Lime	8 lbs.
Water	100 gal.

Dissolve the blue vitriol in a barrel and dilute to fifty gallons. Slake the lime, being careful to avoid "drowning" or "burning." When thoroughly slaked, dilute to fifty gallons. Dip from the two barrels and pour together through a gunny sack or other strainer into the spray tank or barrel.

Where a large number of trees are to be sprayed it will be found best to prepare a large quantity of the material at one time. This can be done providing they are not mixed until ready for using. These stock solutions may be prepared as follows:

Stock Solution of Blue Vitriol.—Suspend forty pounds of blue vitriol in a burlap sack in forty gallons of water. Hang it well up from the bottom of the barrel. In about five hours the crystals will be dissolved. One gallon stock solution equals one pound of blue vitriol. Do not allow this solution to stand in tin or iron vessels. Keep the barrel tightly covered to avoid losses by evaporation. Mark the height of the liquid in the barrel if it is to be left standing for a time before using. The material should be brought to this point before using by adding water.

Stock Solution of Lime.—Slake forty pounds of lime. Add about two pailfuls of water at first, and then allow lime to heat well before stirring. When hot add more water slowly as it is absorbed, and stir thoroughly. The hot lime improves by standing about one hour if stirred frequently. Add water to make forty gallons. One gallon of stock solution equals one pound of lime.

These stock solutions can be kept for considerable periods and Bordeaux made as desired. To prepare 100 gallons of Bordeaux stir the stock solution, measure eight** gallons of blue vitriol stock solution into a fifty-gallon barrel and fill with water. Measure eight** gallons of lime stock solution into another barrel and fill with water. Stir both thoroughly. Strain equal amounts of each solution at the same time through a gunny sack or strainer into a third barrel, two men pouring, or run the mixtures through a trough or spout into the spray tank.

Test of Bordeaux.—It is a good plan to test the Bordeaux. The best test is to add a drop of a solution prepared by dissolving a few crystals of potassium ferro-cyanide in a small amount of water to a small quantity of Bordeaux. If a brown discoloration occurs, more lime should be added.

*At present prices, formula may be reduced to six pounds each lime and copper sulphate.

**Six gallons, if the reduced formula is used.

Destroying Strawberry Worms.

To the Editor:—Will tell you my success in getting rid of worms in strawberries. Have had trouble with them for three years. Last year when they began to take the plants I got a barrel of air-slaked lime and put some in a gunny sack and sprinkled or scattered it on the plants. Was soon rid of all the worms. The lime will also be good for the plants and no harm is done to the berries. There is no need of plowing up the bed.

Chas. Stetzel.

Alexander Legge, general manager of the International Harvester Company, denies that the company has bought more sisal than it needed for binder twine this year, with a view to creating an impression of a shortage to embarrass the Yucatan Planters' Sisal Marketing Association. Mr. Legge testified that the supply of binder twine carried over from last season was the smallest that had ever lasted from one season to another.

Guaranteed Seed Corn

WE recently sent average identical sample of our Northern Iowa latitude grown and Central Minnesota (Redwood Co.) grown seed corn to the foremost agricultural college of this country and have just received their official report, as follows:

Nor. Iowa lat. grown.		Cen. Minn. (Redwood Co.) grown.	
Wimple's Yellow Dent	97%	Northwestern Dent	96%
Iowa Gold Mine	96%	Wis. No. 7 or Silver King	92%
Goddard's Sil. King	94%	Minnesota King	96%
Reid's Yellow Dent	97%	Minn. Ea. Yel. Dent	92%
Minnesota No. 13	90%	Minnesota No. 13	88%
		Minnesota Early White Dent	73%

THESE LOTS ARE ALL 1914 CROP

The above tests prove that our stocks of genuine NORTHERN GROWN Seed Corn are the highest qualities you can buy—regardless of price.

We Give You a Sworn Statement as to Where Our Seeds are Grown

We do not handle any dent corn from either central or southern Iowa, Nebraska, Kansas, Missouri or Illinois, as such seed, although of good germination, cannot ripen and mature in the north. Look at your map. **Don't buy seed corn that is grown south of you.**

We GUARANTEE every bushel of Seed Corn we ship to be exactly as represented in every particular or money refunded.

Get our FREE catalog at once and send your order promptly if you want any of the above lots.

THE ADAMS SEED COMPANY
BOX 50, DECORAH, IOWA

don't buy those EXTRA HORSES

Save DISCING, HARROWING, ROLLING. Do all this work while you plow. Hitch a Kramer Rotary Harrow behind your plow—disc, level, harrow and pulverize as you go. Save extra teams right during the busy season. Produces a moist seed bed that germinates quickly—no clods or dry dirt to hold back your crops—no missing hills. Fits any plow, satisfaction absolutely guaranteed. Works in all kinds of soil—light draft, no extra horses required.

The "Kramer" does more work than discing and harrowing the old way. Big FREE Illustrated Folder.

"Billy" Sunday—
The Man and His Message

"I'll fight till Hell freezes over"

A Great Book for Every Home

It carries the message that led over 200,000 to hit the Sawdust Trail

"Billy" Sunday has probably led more persons to make a public confession of discipleship to Jesus Christ than any other man who ever lived. Making Christians is from all angles the greatest work in the world. Therefore the world may well ask "What manner of man is this?" For over 200,000 men and women have taken Mr. Sunday's hand in token that henceforth their lives would belong to Christ. Over 2,000,000 persons have listened to Mr. Sunday's voice and still the work goes on. Tens of thousands of those men who have been converted under Mr. Sunday's influence were husbands—hundreds of whom had been separated from their wives and children by sin. Now in reunited homes, whole families bless the memory of the Man of God, who gave them back husbands and fathers.

Every conceivable type of humanity is included in the total of over 200,000 converts. The college professor, the prosperous business man, the eminent politician, the farmer, the editor, the doctor, the author, the athlete, the "man about town," the criminal, the drunkard, the society woman, the college student and the working man.

GOD'S MAN SENT IN GOD'S OWN TIME.

The greatest single personal force in the social and political as well as the religious life of America today is Rev. William Ashley Sunday.

The crowds follow him. Neither rain nor cold, not even a blizzard, can keep them away. Week after week vast throngs of people wend their way daily to hear a strong man preach a strong gospel which can meet the real need of every human heart. This man is doing what college professors, political demagogues, statesmen, lecturers, orators and the most eloquent preachers are unable to do. He compels men and women to hear him. He reaches their hearts.

"You old skeptic, we are counting time on you"

Let the Message of this Great Man Influence You, Your Dear Ones and Your Home

Authorized by Mr. Sunday

This work contains the heart of Mr. Sunday's gospel message arranged by subjects, and published by special agreement with him for the use of copyright material and photographs, which could be used only by permission.

Our Special Offer

By special arrangements with the publisher of this book we are permitted to use a limited number and **we will send this book** (500 pages and more than 50 illustrations) prepaid with

The People's Popular Monthly Two Full Years for Only $1

Every one who has ever heard "Billy" Sunday will want this book. Every one who has never had an opportunity to hear him should get a copy without fail.

AT THIS SPECIAL LOW PRICE, this offer is one of the greatest ever made and you must send your order by May 25th to make sure of receiving a copy.

HEPSEY BURKE--A Sister to David Harum

By G. N. Wescott, the Brother of the Author of "David Harum."

(Copyright 1915.)

CHAPTER XVIII.
The New Rectory.

WHEN Betty returned and Donald told her the happenings of the morning the clouds dispersed somewhat and before long the dictum that "there is humor in all things"—even in ejection from house and home—seemed proven true. After lunch they sat in Donald's den and were laughingly suggesting every kind of habitat, possible and impossible, from purchasing and fitting up the iceman's covered wagon and perambulating round the town to taking a store and increasing their income by purveying Betty's tempting preserves and confections.

Their consultation was interrupted by the arrival of Nickey, armed with a Boy Scouts' "Manual."

"Gee! Mr. Maxwell, Uncle Jonathan Jackson's all right; I'll never do another thing to guy him. He's loaned us his tent for our Boy Scouts' corpse, and I've been studyin' out how to pitch it proper, so I can show the kids the ropes, but——"

"Donald!" cried Betty. "The very thing—let's camp out on the church lot."

"By Jinks!" exclaimed Maxwell, unclerically. "We'll have that tent up this very afternoon—if Nickey will lend it to us, second hand, and get his men together."

Nickey flushed with delight. "You betcher life I will," he shouted excitedly. "Is it for a revival stunt? You ain't goin' to live there, are you?"

"That's just what we are going to do, if Jonathan and you'll lend us the tent for a few months. Mr. Bascom wants to let the rectory to some other tenants and we've got to find some where else to lay our heads. Why, it's the very way! There's not a thing against it that I can see. Let's go and see the tent and consult Mrs. Burke. Come along, both of you."

And off they hurried, like three children bent on a new game. It was soon arranged and Hepsey rose to the occasion with her usual vim. To her and Nickey the transportation of the tent was consigned, while Maxwell went off to purchase the necessary boarding for a floor and Mrs. Betty returned to the rectory to pack up their belongings.

"We'll have to occupy our new quarters tonight," said Maxwell, "or our friend the enemy may raid the church lot in the night and vanish with tent and all."

An hour or so later, when Maxwell arrived at the church, clad in overalls and riding on a wagon of planks he found Mrs. Burke and Nickey with a contingent of stalwarts awaiting him. There was a heap of canvas and some coils of rope lying on the ground near by. Hepsey greeted him with a smile from under the shade of her sunbonnet.

"You seem ready for business, even if you don't look a little bit like the Archbishop of Canterbury in that rig," she remarked. "I'm afraid there'll be an awful scandal in the parish if you go wanderin' around dressed like a carpenter, but it can't be helped and if the Bishop excommunicates you I'll give you a job on the farm."

"I don't mind about the looks of it, but I suppose the vestry will have something to say about our camping on church property."

"That needn't worry you. Maybe it'll bring 'em to their senses and maybe they'll be ashamed when they see their parson driven out of his house and havin' to live in a tent—though I ain't holdin' out much hope of that to you. Folks that are the most religious are usually the hardest to shame. I always said, financially speakin', that preachin' wasn't a sound business. It's all give and no get, but this is the first time I've ever heard of a parish wanting a parson to preach without eating and to sleep without a roof over his head. Most of us seem to forget that rectors are human like the rest of us. If religion is worth havin' it's worth payin' for."

The planking was soon laid and the erection of the tent was left to Nickey's captaining—all hands assisting. With his manual in one hand he laid it out, rope by rope, poles in position and each helper at his place. Then at a word up it soared, with a "bravo" from the puzzled onlookers.

"We want a poet here," laughed Maxwell. "Longfellow's 'Building of the Ship,' or Ralph Connor's 'Building the Barn' aren't a circumstance to Nickey's 'Pitching the Parson's Tent.'"

It was next divided off into three convenient rooms, for sleeping, eating and cooking—and Hepsey, with three scouts, having driven across to the old rectory while the finishing touches were being put to the new, she and her military escort soon returned with Mrs. Betty and a load of furniture and other belongings.

"Why, this is perfect!" cried Betty. "The only thing lacking to complete the illusion is a trout brook in the front yard and the smell of pines and the damp, mossy earth of the forests. We'll wear our old clothes and have a bonfire at night and roast potatoes and corn in the hot coals and have the most beautiful time imaginable."

The town visitors who still lingered on the scene were received cordially by Maxwell and Mrs. Betty, who seemed to be in rather high spirits, but when the visitors made any inquiries concerning structural matters they were politely referred to Nickey Burke for any information they desired, as he had assumed official management of the work.

Just before the various helpers left at six o'clock smoke began to issue from the little stovepipe sticking out through the canvas of the rear of the tent and Mrs. Betty, with her sleeves rolled up to her elbows and her cooking apron on, came out to watch it with all the pride of a good housekeeper.

"Isn't it jolly, Mrs. Burke," she exclaimed. "I was afraid that it would not draw, but it really does, you see. This will be more fun than a month at the seashore, and tomorrow we are going to have you and Nickey dine with us in the tent, so don't make any other engagement. Don't forget."

By noon of the following day everybody in town knew that the Maxwells had been dispossessed and were camping on the church lot, and before night most of the women and a few of the men had called to satisfy their curiosity and to express their sympathy with the rector and his wife, who, however, seemed to be quite comfortable and happy in their new quarters. On the other hand, some of the vestry hinted strongly that tents could not be put upon church property without their formal permission and a few of the more pious suggested that it was little short of sacrilege thus to violate the sanctity of a consecrated place. Nickey had painted a large sign with the word "rectory" on it, in truly rustic lettering and had hung it at the entrance of the tent. The editor of the Durford Daily Bugle appeared with the village photographer, and after an interview with Maxwell requested him and his wife to pose for a picture in front of the tent. This they declined with thanks, but a half-column article giving a sensational account of the affair appeared in the next issue of the paper, headed by a half-tone picture of the tent and the church. Public sentiment ran strongly against Bascom, to whom rumor quickly awarded the onus of the incident. In reply to offers of hospitality Maxwell and Mrs. Betty insisted that they were very comfortable for the time being and were not going to move or make any plans for the immediate future. The morning of the fourth day Maxwell announced to Mrs. Betty that he had a strong presentiment that Bascom would soon make another move in the game, and he was not surprised when he saw Nelson approaching.

"Thank goodness we are in the open air this time," Maxwell remarked to Betty as he caught sight of the visitor. "I'll talk to him outside—and perhaps you'd better shut the door and keep out the language. I may have to express myself more forcibly than politely."

Nelson began:

"I am sorry to have to intrude upon you again, Mr. Maxwell, but I must

inform you that you will have to vacate that tent and find lodgings elsewhere."

"Why, pray? This tent is my property for as long as I require it."

"Ah! But you see it has been put up on the land that belongs to the church and you have no title to use the land, you know, for private purposes."

"Pardon me," Maxwell replied, "but while the legal title to all church property is held by the wardens and vestry collectively, the freehold use of the church building and grounds is held by the rector for the purpose of the exercise of his office as rector. No church property is injured by this tent. This lot was originally purchased for a rectory. To all intents and purposes (excuse me, I am not punning) this tent is the rectory pro tem. The use of a rectory was offered me as part of the original agreement when I accepted the call to come to this parish."

"Hm! You speak quite as if you belonged to the legal profession yourself, Mr. Maxwell. However, I am afraid that you will have to get off the lot just the same. You must remember that I am simply carrying out Mr. Bascom's instructions."

"Very well, please give my compliments to Mr. Bascom and tell him that he is welcome to come here and put me out as soon as he thinks best. Moreover, you might remind him that he is not an autocrat, and that he cannot take any legal action in the matter without a formal meeting of the vestry, which I will call and at which I will preside. He can appeal to the Bishop if he sees fit."

"Then I understand that you propose to stay where you are, in defiance of Mr. Bascom's orders?"

"I most certainly do. It is well known that Mr. Bascom has successfully intimidated every one of my predecessors, but he has met his match for once. I shall not budge from this tent until I see fit."

"Well, I should be very sorry to see you forcibly ejected."

"Don't waste any sympathy on me, sir. If Mr. Bascom attempts to molest me I shall take the matter to the courts and sue him for damages."

"Your language is somewhat forcible, considering that you are supposed to be his pastor and spiritual adviser."

"Very well, tell Mr. Bascom that as his spiritual adviser I strongly suggest that his spiritual condition will not be much improved by attempting to molest us here."

"But to be perfectly frank with you, Mr. Maxwell, he can force you to leave by stopping the payment of your salary, even if he does not eject you by force."

"I rather think not. Until he can bring specific charges against me, he is liable for the fulfillment of our original contract, in his writing. Moreover, I may have more friends in the parish than he imagines."

Nelson was visibly disturbed by the rector's firm hold on the situation.

"But," he stuttered, "Mr. Bascom is the richest man in the parish and his influence is strong. You will find that everyone defers to his judgment as a matter of course."

"All right, then let me add, for your own information, that I can earn my living honestly in this town and take care of myself without Mr. Bascom's assistance, if necessary, and do my parish work at the same time. I have two muscular arms, and if it comes down to earning a livelihood, independent of my salary, I can work on the state road hauling stone. Williamson told me yesterday he was looking for men."

"I can scarcely think that the parishioners would hold with their rector working like a common laborer, Mr. Maxwell," admonished Nelson.

"We are all 'common,' in the right sense, Mr. Nelson. My view is that work of any kind is always honorable when necessary, except in the eyes of the ignorant. If Mr. Bascom is mortified to have me earn my living by manual labor, when he is not ashamed to repudiate a contract, and try to force me out of the parish by a process of slow starvation, his sense of fitness equals his standard of honor."

"Well, I am sure that I do not know what I can do."

"Do you want me to tell you?"

"If it will relieve your feelings," Nelson drawled insolently.

"Then get out of this place and stay out. If you return again for any purpose whatever I am afraid it is I who will have to eject you. We will not argue the matter again."

"Well, I regret this unfortunate encounter, and to have been forced to listen to the unguarded vituperation of my rector." With which retort he departed.

Soon after Nelson had left, Mrs. Burke called in, and Betty gave her a highly amusing and somewhat colored version of the interview.

"You know, I think that our theological seminaries don't teach budding parsons all they ought to by any means," she concluded.

"I quite agree with you, Betty dear, and I thank my stars for college athletics," laughed Maxwell, squaring up to the tent pole.

"What did I tell you," reminded Hepsey, "when you had all those books up in your room at my place. It's just as important for a country parson to know how to make a wiped joint or run a chicken farm or pull teeth, as it is to study church history and theology. A parson's got to live somehow, and a trade school ought to be attached to every seminary, according to my way of thinking! St. Paul made tents, and wasn't a bit ashamed of it. Well, I'm mighty glad that Bascom has got come up with for once. Don't you give in and it will be my turn the next move, if this don't bring him to his senses. You just wait and see."

(To be continued.)

Soil conditions have an important relation to potato tuber diseases and many of these are widely spread throughout the country, perhaps native to some soils. Common scab is favored by a neutral or slightly alkaline soil and seldom gives trouble in acid soils. It is, therefore, increased by liming and by fresh stable manure, wood ashes and alkaline fertilizers, such as nitrate of soda and ground bone, while acid phosphate and sulphate of ammonia tend to diminish scab.

A $3,500.00 Home Game

419 Cash Prizes for

GIVING NAMES TO PICTURES

Idle Hour Entertainment---No Expense Required

$3,500.00 CASH
419 PRIZES

First prize	$1,250.00 cash
Second prize	625.00 cash
Third prize	350.00 cash
Fourth prize	250.00 cash
Fifth prize	150.00 cash
Sixth prize	100.00 cash
7th, $75.00; 8th, $50.00; 9th,	$20.00.
10th to 24th, each $2.50	$ 37.50
25th to 419th, eac $1.50	$592.50

Should there be a tie for any prize, the full prize tied for will be paid each tying contestant.

There is no wo k connected with the Picturegame in any way. It is what we say it is—a picture-naming entertainment for all the family to play during their idle moments; and we will give the great cash prizes to those who use their common sense best. All contestants will be assured of equal treatment, and splendid fun. Send in at once and learn all about this unique opportunity game. **Do that at once, and have it over with!**

Today's Magazine offers every person the opportunity of competing in a great cash pastime, something with which to fill spare moments at home with money interest. **You** may win a great cash sum playing! See the picture to the left? It's an example, to show you how the $3,500 Book Title Picturegame is played. It shows a Woman saying to two children, "Now I will tell you a story of New York and San Francisco". What book title would make a good name for that picture? Why, the title, "A Tale of Two Cities". That's plain, isn't it?

You will be offered a list of book titles, arranged in alphabetical order, from which all titles for the pictures must be chosen. All contestants will glance over the titles, and submit those they think best fit for the pictures. The prizes will be given for the 419 best sets of answers. No book knowledge at all is used none is needed in the picturegame at all.

We have provided a way by which all may compete free of charge without one cent of expense. Send in the coupon **right now** and learn all about this home game. At least know what it is—it may prove to be a gold mine for you.

If none of the above combinations suit you, you can make up your own club of papers in the following way: First select The Wisconsin Farmer and figure it at $1.00 per year. Then select any of the papers or magazines listed above and figure them at half their regular subscription price as indicated above, choosing whatever papers or magazines that appeal to you. As an example, suppose you should want The Wisconsin Farmer, Kansas City Weekly Star, Woman's World and People's Home Journal. You would figure The Wisconsin Farmer in the combination at $1.00; then you would add up the regular subscription price of the other three papers, which amounts to $1.10. Half of that amount equals 55 cents. Add this to the regular price of The Wisconsin Farmer, which is $1.00, and you would have a total of $1.55, which would be the rate for The Wisconsin Farmer, Kansas City Weekly Star, Woman's World and People's Home Journal.

If you wish to subscribe for any papers or magazines not listed in any of the above offers, write to us for special rates. Send all orders to Club Dept., The Wisconsin Farmer, Madison, Wis.

This Picture In Colors

Suitable for Framing

Costs Nothing Extra

INCLUDED free with Pictorial Review for May is a magnificent picture—a reproduction in seven colors of the world-famous painting,

"The Lost Playmate"

We were going to show you a reduced copy of this picture in this announcement, but it would be impossible to do it justice. We simply could not show the beautiful, soft tints, the wealth of delicate colors in this picture.

It is printed in seven exquisite colors in the May Pictorial Review by what is known as the rubber offset process—the most costly method of reproduction known to the publishing world. It is the very process used in printing art pictures that bring as high as $50 on Fifth Avenue, New York.

This charming picture alone would cost many times the price of a year's subscription to Pictorial Review. It is ready to detach from the magazine and frame. What a tender story it tells! How it will touch the heart of every one who sees it!

No publisher in America ever before this printed such a beautiful reproduction in so many colors and then included it with a 15c magazine without extra cost.

Pictorial Review for May is a gorgeous issue. All the newest, smartest, last-minute Spring styles are shown. In colors too! Then there are five unusual short stories, a big 27,000 word installment of "The Heart of Rachel," a Dolly Dingle Cut-out in colors for the children as well as many other special features.

Sign and mail the coupon below with 50c and we'll send you Pictorial Review for four months, beginning with the May issue, containing the picture in seven colors.

PICTORIAL REVIEW FOR MAY

PICTORIAL REVIEW COMPANY
218 West 39th Street, New York City.

Gentlemen:—

I enclose 50c. Please send me Pictorial Review for four months, beginning with the May issue including the seven-color picture, "The Lost Playmate."

Street .....

City .....

VETERINARY MATTERS

PROFESSIONAL Veterinary advice through this department to regular subscribers only. We do not answer veterinary inquiries for the benefit of "neighbors." Parties desiring information will be required to send their names in full with their address. No question will be answered by mail unless accompanied by a fee of one dollar. In order that correct information may be given, the symptoms should be accurately described, stating of how long standing, together with color and age of animal, and what treatment, if any, has been resorted to. All veterinary inquiries should be addressed to this office.

AILING ANIMALS.

Indigestion.

Please tell me what is the matter with my Water Spaniel pup. He is a very good hunting as well as watch dog, but I have noticed that at times the saliva hangs in long strings from his mouth and many times he throws up what he eats. Is this due to his teeth or has he some disease? He is eighteen months old.

Give your dog's feed attention. Give a reasonable quantity of clean, wholesome food regularly, with plenty of fresh, clean water to drink. Give one ounce of sirup of Buckthorn every day for a week until the bowels act regularly. Regular exercise is also essential.

Shoe Boil.

Please inform me what to do for my horse. It has had a shoe boil for three years and it now has become inflamed and swollen and a little hole has formed and matter is leaking out. Should I open it or should I call a veterinarian and have him cut it out? What medicine should I use?

You should have had this attended to long ago. Would advise you to keep a knife out of this. However, would also advise you to have a competent veterinarian cut this growth out if you expect to get good results. The use of caustics is sometimes employed, but they do not prove very satisfactory, as it takes too long and the results are not always the best.

Swollen Feet in Pigs.

Some of my little pigs are affected with a swelling in their front feet which makes them lame. They are about three weeks old and in a good, thrifty condition, having good, dry quarters with plenty of exercise. The swelling takes place in the toes and is very hard, but not seemingly feverish nor sore to the touch. In one case the leg is swollen about three times its natural size as far up as the shoulders. I have never known anything like it before. Is it rheumatism?

We have seen any number of these cases and usually find they are brought about by the mother injuring them by stepping on them or otherwise. We do not think the trouble you speak of has anything to do with rheumatism.

Testing Cattle.

(1) How is it that a man has to have his cattle tested before he moves to another state when he can go to the Sioux City market and buy a load and ship them into Dakota or Minnesota without having them inspected? (2) If you call a veterinarian to test your cattle for you can he force you to sell them? Does the state pay for testing if they take the cattle in their hands? (3) Do they have to be tagged when you ship them? And does the veterinarian have to inform them they are coming so they can be on the lookout for them? If so, what are the government inspectors there for? Are they there to protect the packers and soak the innocent farmer?

(1) A shipper must comply with the regulations of the state authorities to which he wishes to send the stock. If the requirements are not the same from the farm to the other state as they are from a center or stockyards where federal inspection is maintained it is evident the state authorities have confidence in the inspection. (2) The veterinarian will not endeavor to force you to sell your cattle that have reacted to the tuberculin test. If he is a friend he will advise you to sell them and if you would serve your own best interests you will do so. The state authorities will do your testing free in case they have authority to do so and have the necessary funds to meet the expense. They do not have to be tagged before shipment, yet the owner would lose nothing if they were. The local veterinarian does not inform the government inspectors the reactors "are coming," yet the owner should not object if he did unless he (the owner) wanted to try to put something over on the inspectors. This would do no good, for if they are tubercular the inspector will find them and dispose of them properly, without any previous warning. A farmer that would try to knowingly dispose of tubercular cattle for food for the public could scarcely be called "innocent." Contrariwise, the farmer that says "my cattle have reacted; inspect them and deal justly by me and the public" can be called "innocent" (of any wrong doing) and will not suffer at the hands of the packers or the government inspectors.

CURES HEAVES BY CORRECTING CAUSE—INDIGESTION. IT'S A GRAND CONDITIONER AND WORM EXPELLER
Safe. Most economical. Excellent for Cattle and Hogs. $1.00 per can at dealers, at same price by parcel post.
THE NEWTON REMEDY CO., Toledo, Ohio

HEAVES cured or money back. Baird's Heave Remedy is guaranteed. Write Baird Mfg. Co., Box 618, Purcell, Okla., for particulars.

$1.00 PER WEEK Enough said. Write the Wisconsin School of Telegraphy, Dept. A, Oshkosh, Wisconsin.

Live Stock and Commercial Field Notes

Collected by Representatives of The Wisconsin Farmer

A Richly Bred Guernsey Bull.

THE Fox River Valley, Wisconsin, is the home of many fine herds of registered Guernsey cattle. Recently when on a tour of inspection of these herds the writer was surprised to find the great progress which these breeders have made in the past few years. One of the oldest and best herds in this section of the state is that of Chas. G. Schmidt, at Wrightstown. This herd was established about twenty years ago and a fine lot of animals were developed. The herd now consists of over forty registered animals. They are all imported or offspring of the imported animals and are of big size, of the best Guernsey type. The imported cows are daughters of Galaxy's Sequel, Imp. Francis Masher, Gov. of the Chene and Imp. Raymond of the Preel. The bull at the head of the herd is Goodwill's Hero, an outstanding son of Imp. Golden of L'Etinnerie. He, therefore, is a brother to the noted bull, Imp. Golden Hero. He also has four advance registry sisters. The dam of Goodwill's Hero is Imp. Goodwill II of the Grove that has an A. R. record of 52.62 pounds of fat and 8,384 pounds of milk in a year. She is a daughter of the great bull, Gov. of the Chene. He is, therefore, from imported animals on both sides with the additional value of being from a heavy producing A. R. dam. Mr. Schmidt is advertising a yearling bull for sale on page 25. This young bull is out of the cow, Imp. Sunpari XXXI 26702, a daughter of Galaxy's Sequel by Masher Sequel. Her dam is a daughter of Gov. of the Chene. From this limited description it will be seen that the breeding of this herd is of the best in the breed and that the bull offered for sale carries the best of blood in his veins. He is a fine individual being well grown, well marked and of good, straight type. Our readers who are looking for a high-class herd sire will do well to send for a pedigree of this one.—Adv.

Holstein Sale at Elkhorn, Wis.

MR. A. J. PIERCE, of Elkhorn, Wis., has decided to dispose of his fine herd of pure-bred Holstein cattle. This herd, including forty-four females and eight young bulls will be offered at public auction at the fai rground at Elkhorn, Wis., May 9th. This sale comes just after the sale at Watertown and Lake Mills. The females offered are for the most part young stock, coming fresh with first or second calf and includes also some yearlings and a few heifer calves. The eight young bulls offered are three months old to yearlings. A description of the blood lines of this young stock may be found by referring to Mr. Pierce's advertisement which appears on page 26 of this issue. This is a rare offering of young stock to be put up at public auction. The stock is tuberculin tested and sold with a positive guarantee to be as represented. Our readers who are desirous of conferring with Mr. Pierce by mail to secure any further information should address him at Elkhorn, Wis. Please be kind enough to mention The Wisconsin Farmer in your letter.—Adv.

Game Farming Is a Profitable Business.

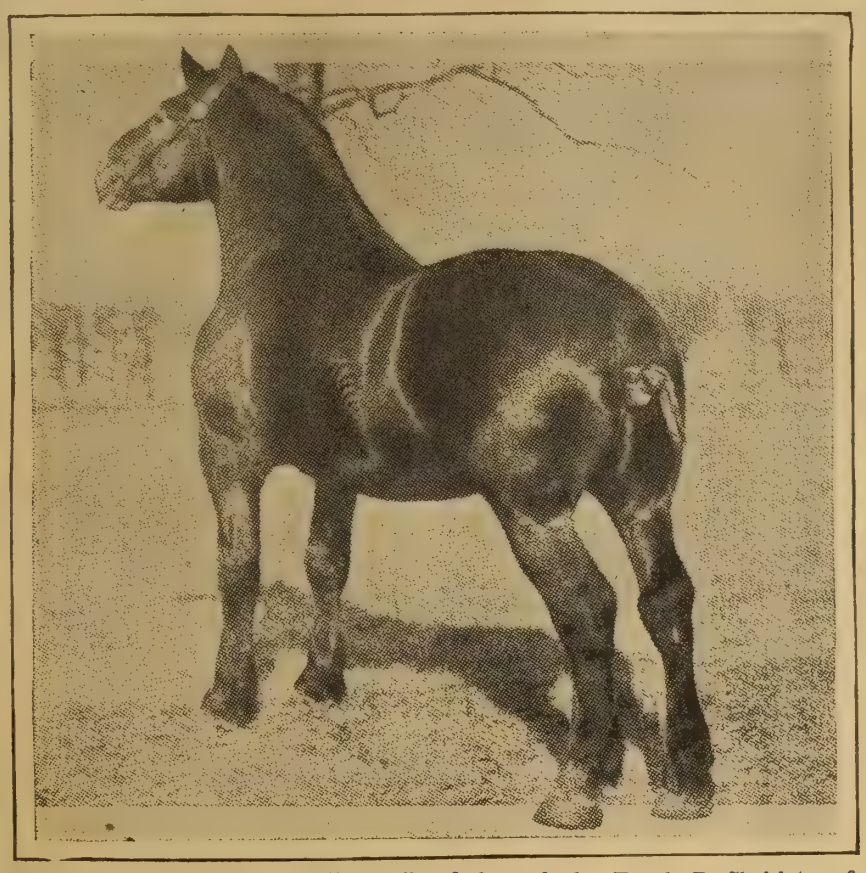
THE subject of game farming is not well understood in this country; in some of the older countries it has received considerable attention, and many farmers have found a very profitable business in rearing game birds and animals. A very profitable and enjoyable business can be built up in this line by anyone who has the knowledge and equipment necessary to undertake it. As a side line to general farming, game farming is receiving considerable attention. The possibilities in this are greater than one thinks. "Game Farming for Profit and Pleasure" is the title of a book which explains the various phases of this new business. The book is written largely for practical farmers, who will find it very interesting reading. To get this book write your name on the coupon attached to the advertisement on page 11 and send to Game Breeding Dept., Hercules Powder Co., Wilmington, Del. Kindly mention this paper.—Adv.

Write for This Free Book on Silos.

FARMERS interested in getting a new silo should send for the free silo booklet which is published by the Canton Culvert and Silo Company, Canton, Ohio. This book tells of the success of Zyro metal silos, which have proven very efficient in keeping ensilage sweet and nutritious. They are built of pure galvanized iron which is rust-resisting and durable. The flanged metal sheets are easily fitted together and made absolutely air tight and moisture tight. These silos can be erected at small cost and will be proof against wind, fire, shrinking, swelling and collapse. Read the advertisement on page 10 and send for the booklet today. Please mention The Wisconsin Farmer. —Adv.

Could Shoe Entire U. S. Army in Five Days.

BY keeping its factory going at full capacity day and night for five days, a pair of shoes could be made for every soldier of the United States standing army of 120,000 men. This interesting news was given out by the officials of the well-known Mayer Boot & Shoe Company, of Milwaukee, to convey some idea of the magnitude of a present-day modern shoe factory. The regular working capacity of the Mayer factory is 10,000 pair of shoes for every ten-hour working day. This is at the rate of seventeen complete pairs of shoes every minute. In other words, there is available in this one plant facilities for turning out 3,000,000 complete pairs of shoes during every working year of 300 days. But still more astonishing is the fact that each shoe requires an average of seventy-five operations in the making. This means 450,000,000 operations during each working year, which keeps industrious hands busy and provides employment for many. The product of the Mayer Boot & Shoe Company is well known to our readers, having been advertised with us for years. The company has been in business for over thirty-five years and grew from a very small beginning to the present big proportion, simply by making good shoes. They manufacture the well-known Mayer Honorbilt shoes for men, women and children, Martha Washington comfort shoes, Dry-Sox wet weather shoes and Honorbilt cushion shoes. See page 18.—Adv.



THE type of Percheron stallions offered for sale by Frank P. Shekleton & Sons, Lawler, Iowa, on page 27. This horse and many others of excellent merit are to be found in their barns.

Sheboygan County Holstein Sale.

THE Holstein Breeders' of Sheboygan county, Wis., will hold their second annual Holstein sale at Plymouth on May 8th. The offering will be one of the best ever put through a sale ring in this country. During the past three years a great deal of official testing has been done in the county and a large number of these A. R. O. cows or their offspring will be consigned. Sheboygan county has long been known as one of the greatest dairy counties of this the greatest dairy state. It is now gaining the reputation of the home of great producing Holstein cows. Last year the world's first thirty-pound two-year-old record was made in this county. This year two Sheboygan county cows made over 1,200 pounds butter in the year. Several others made over 1,000 pounds. A three-year-old heifer made over thirty pounds butter in seven days. These animals are representative of the type of animals to be found in the county. It will be a sale well worth attending and we advise our readers to send for catalogs. See advertisement on page 24. —Adv.

Marshfield Sale May 10th-11th.

CATALOGS for the big Marshfield sale to be held at the new sales pavilion in Marshfield, Wis., May 10th and 11th, may be secured now by anyone who will write to E. E. Butters, Marshfield, Wis. In this sale there will be 125 pure-bred Holsteins offered. These are consigned by some of the best breeders of Wisconsin, including Mr. T. Vannedom, of Marshfield; Imig Bros., of Neillsville; Jake Schmidt, of Arpin; E. E. Butters, of Marshfield; J. C. Kieffer & Sons, of Auburndale; Wm. Krause, of Thorp; McMillan Bros., of McMillan; F. W. Fisher, of Thorpe; John F. Kelly, of Neillsville; C. H. Imig, of Junction City, and O. J. Leu, of Grand Rapids. A description of the offerings and some mention in detail of the individuals will be found in an advertisement on page —of this issue. In addition to the 125 pure-bred Holsteins to be offered there will also be a few pure-bred Guernseys, one pure-bred Percheron draft stallion and two grade Percheron draft mares consigned to this auction. This is the third sale held in the Marshfield pavilion. This barn contains 176 patent stanchions and sixteen box stalls. There is an abundance of room for the showing of stock and a great opportunity for every buyer to make careful inspection. There is a sixty-foot sale ring in the center of this barn with a seating capacity for over 1,000 people. It is expected that the sale will be a great success. We request that our readers who write for catalog please mention The Wisconsin Farmer in their letter. See page 25.—Adv.

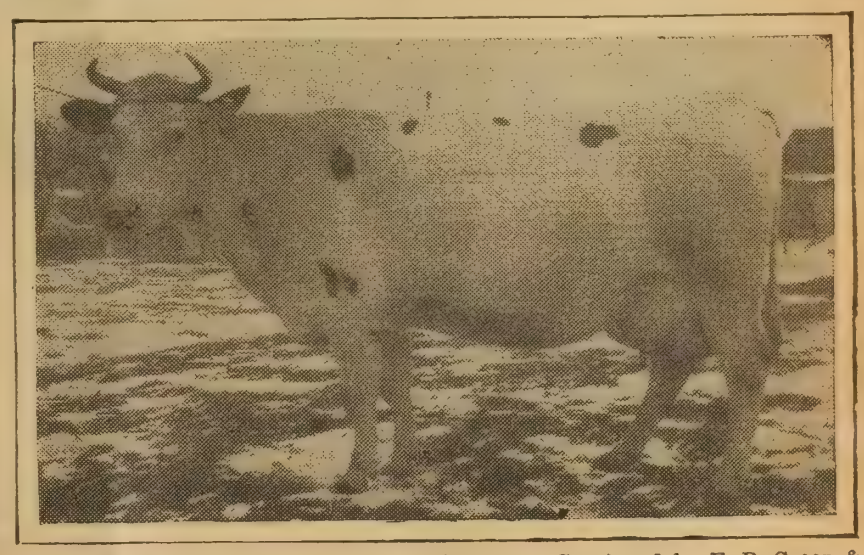
Last Call for West Salem Guernsey Cattle Sale.

THIS is the last opportunity we will have to call your attention to the sale of imported and American-bred Guernsey cattle to be sold at West Salem, Wis., Wednesday, May 3d. In our previous issues we have mentioned what has been listed for this sale, but since then we have seen the individuals that go to make up this sale and we are glad to advise our readers that they are a useful lot of cattle, being very well bred and several with A. R. records. Mr. Stubbs is selling about twenty head of cows and heifers that are in calf to the great sire, Imported Holden 4th. The fact that he is the sire of the present world's record two-year-old heifer is recommendation enough for him. Females bred to him should be in demand. Rundell Brothers are selling several daughters sired by the bull they imported, Governor of St. Croix he by the great Governor of the Chene. There will also be some cows well along in calf to him. A picture of this bull appears in this issue. If you haven't received a catalog write for one at once and arrange your plans so that you can attend this good sale. Mr. A. L. Hyzer is sale manager and if you will address him at West Salem, Wis., you will receive your catalog. In writing please mention The Wisconsin Farmer.—Adv.

Another Duroc Breeder for Wisconsin.

THE Duroc Jersey continues to gain in popularity and one of the recent additions to the Duroc fraternity in the state of Wisconsin is, Brain L Rundell, Hammond, Wis. Mr. Rundell is widely known as a breeder and importer of Guernsey cattle and the Duroc men should feel glad to know that they have such a progressive man for a fellow breeder. He purchased his first sows last winter and only a few and, even though he does not expect to show at the state fair, he was one of the first to nominate his herd in the Duroc

IMPORTED GOVERNOR OF ST. CROIX, a son of Governor of the Chene. Cows bred to him and heifers sired by him will be sold by Rundell Brothers in the West Salem, Wis., sale, May 3d.



TOOTSIE FIEKJE 117455, A. R. O. 26.14 pounds. Consigned by F. B. Green & Son, Evansville, Wis., to the Lake Mills Consignment sale on May 2d and 3d. See advertisement on page 24.

futurity, which goes to show the spirit in which he has entered the game. If there were more breeders in the state that would take an interest in the Duroc breed, instead of a selfish interest in their own herd, there would be co-operation, which would greatly benefit this good breed in the state of Wisconsin. Get together and boost your own game, for no one else will do that for you. The Wisconsin Farmer is at the service of the swine breeders of the state. We believe the territory covered by this paper has a great future in the swine industry and if we will all work together we will show the public that Wisconsin can raise as good hogs as any state.—Adv.

Holstein Bull of Rare Quality.

IT IS a well-established fact, conceded by all good breeders that the herd bull is half the herd. For this reason every breeder whether a beginner or one long established in the business, should definitely plan that each succeeding bull used in his herd shall be better than the last. He should always aim to be breeding his herd for higher production instead of letting them stand still or go backward in production ability. It is a problem, however, to locate a herd sire that is above the average, for they are indeed scarce and the demand for them is very large. There is one now being advertised for sale on page 26 by Arthur J. Rust, West Allis, Wis., and readers of this paper, who are looking for an exceptionally well-bred bull will find in this one an opportunity to get a bull of rare quality. His dam, Ida Lotta 5th, as a four year old made 29.74 pounds of butter in seven days. She gave 556 pounds of milk, testing 4.20 per cent fat. As a junior three year old she made 816.91 pounds of butter and gave 17,890 pounds of milk in a year. She is a daughter of the great cow, Ida Lotta, that made 27.11 pounds of butter and gave 662.70 pounds of milk in seven days. Ida Lotta 5th has four sisters with records of 33.65, 28.63, 27.54 and 27.99. She is a daughter of Johanna Pontiac De Kol, that has twenty-three A. R. O. daughters, twelve of which have records ranging from twenty to thirty-three pounds of butter in seven days. The sire of the young bull offered for sale is Cornucopia Netherland Mechthilde, that won third prize as a yearling at the 1913 Wisconsin State Fair. His dam, Aaltje Salo Netherland Mechthilde, has a record of 23.35 pounds of butter in seven days and is the dam of Aaltje Salo Netherland Mechthilde 4th, that made 28.63 pounds of butter in seven days as a four year old. For extended pedigree and further information in regard to this animal write to the above address.—Adv.

A Big, Powerful Car at a Remarkably Low Price.

THE remarkably low price of $740 buys the Pullman five-passenger, four-cylinder, thirty-two-horse-power motor car. It is not a racer, but is noted for its large size and abundant power. The Pullman is claimed to be the largest car on the market at the price; the wheel base is 114 inches. The equipment includes Batavia non-skid tires on all four wheels, cantilever rear springs, independent electric starting and lighting systems, Dixie high-tension magneto, honeycomb radiator and full floating rear axle. Pullman cars may also be purchased in two and three passenger models. For wonderful flexibility and consistent performance the Pullman is a great car. If you are in the market for a car, don't fail to get a catalog from the Pullman Motor Car Co., York, Pa. Kindly mention The Wisconsin Farmer. See page 2.—Adv.

Delay Planting on White Grub Land

These Pests Were Very Destructive in 1915 and Steps Should Be Taken to Eradicate Them During the Present Season.

WHEREVER the white grub was destructive last year or wherever spring cultivating shows large, white grubs in the soil the farmer should regard these facts as calling (1) for action to protect his 1916 crops from damage, and (2) for continued warfare on the white grub to prevent heavy destruction of crops in 1918.

The white grubs that were so destructive during the summer of 1915 will have wintered in the ground and may be expected to come nearer the surface as large grubs in April and May. These large grubs will feed to some extent on the roots of plants and may be expected to do some early damage to this year's crop, but fortunately by the middle of June they will become dormant, change to pupae early in July and by the first of September become beetles which remain underground until the spring of 1917.

As the mature white grubs and the pupae are tender and more easily killed by a disturbance of the soil than are the beetles, the entomologists of the United States Department of Agriculture advise the farmer to plow up his land as soon after July 15, 1916, as practicable. The beetles, if allowed to winter in the earth, will emerge as May beetles in May, 1917, lay their eggs and thus start another destructive brood of white grubs that if not destroyed may do as much damage in 1918 as grubs did to crops during 1915.

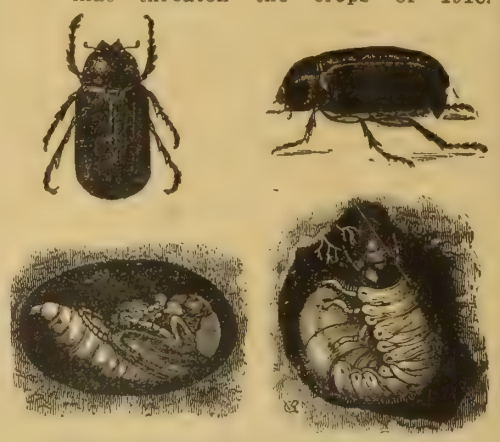
To lessen the damage during 1916 from the brief spring feeding of these large grubs the following measures are important:

(a) If the ground is to be plowed or cultivated in the spring, delay plowing as late as possible, or until the grubs have returned to near the surface (about last of April) and have chickens follow the plow to destroy the grubs that are turned up.

(b) Delay planting until the 15th or 20th of May or a little later if practicable. The object of this is to have the roots of the young plants develop so late that this year's large grubs will not have much chance to do damage before they become dormant early in June.

(c) Where possible, on land that is infested avoid planting corn, timothy, strawberries or early potatoes.

As has been stated, the large grubs that appear this spring will become the May beetles of the 1917 flight, which lay the eggs for and thus begin the three-year cycle of white grubs that threaten the crops of 1918.



THE WHITE GRUB AND ITS MATURE FORM—THE MAY BEETLE.

Therefore, as soon after July 15, 1916, as is practicable in all infested regions farmers should plow up every piece of ground which contained quantities of grubs in 1915 or showed large grubs in any quantity this spring. A plow which will break up the soil as it is overturned should be used, or if this is not possible the ground should be deeply disked after it is plowed in order to break up the soil and disturb the insects in it. The work done in the fall of 1916 will be a good beginning of preventive measures which must be carried out each year to avert the heavy destruction of crops by this brood in 1918. To carry out

Sheboygan County Holstein Breeders' Sale

MONDAY, MAY 8, 1916
PLYMOUTH, WISCONSIN

125 PURE-BRED HOLSTEINS FOR SALE

A Few Pure-Bred Guernseys, One Pure-Bred Percheron Draft Stallion and Two Grade Percheron Draft Mares also offered at

MARSHFIELD, WIS., WEDNESDAY-THURSDAY, MAY 10-11

AT THIS the third sale in the magnificent sale and show barn in Marshfield, a better quality of stock is offered, and there is every promise that this sale will make new records. Breeders in the vicinity of Marshfield are united in their efforts to produce better stock and they have been meeting with wonderful success. A picture of the sale and show barn in which this sale is to be held will be found herewith. This barn contains 176 patent stanchions and sixteen box stalls. We have ample room to show stock and give buyers the best of chance to see what they are buying. There is a sixty-foot sale ring in the center of this barn with seats for over 1,000 people. One hundred and twenty-five pure-bred Holsteins will be offered for sale on the above dates and place. T. F. Vannedom, of Marshfield, will contribute three head that are stable mates of Minerva Beets 85791, grand champion at the 1914 dairy show. Mr. Vannedom raised the above cow, and what he is contributing is of the same quality. Imig Bros., of Neillsville, are putting six head in the sale, one an eight-months-old bull whose dam and sire's dam average 20.4 lbs. butter. The five cows are as follows: A two-year-old daughter of a 14-lb. two year old. A three-year-old daughter of a 20 lb. three year old. The other three have 20-pound dams. Four of the five are A. R. O. cows, and all are sired by Plain View Johanna Fayne. Jake Schmidt, of Arpin, is consigning several head. In this herd we have some very good yearlings as well as seven-day records. Mr. Schmidt has twelve cows in the local cow-testing association. Last month they averaged over fifty pounds of butter fat. E. E. Butters is offering some very good bulls. One from a 22-pound two year old. Others about equally good. Following are the names of some of the other contributors: J. C. Kieffer & Sons, Auburndale; Wm. Krause, Thorp, Wisconsin; McMillan Bros., McMillan, Wisconsin; F. W. Fisher, Thorp, Wisconsin; John F. Kelley, Neillsville, Wisconsin; C. H. Imig, Junction City, Wisconsin; O. J. Leu, Grand Rapids, Wisconsin. A few pure-bred Guernseys will be offered. One pure-bred Percheron draft stallion. Two grade Percheron draft mares, and one good farm team. For catalog write to

E. E. BUTTERS

MARSHFIELD -:- WISCONSIN

the rest of the work it is particularly important to watch the time of occurrence of the beetle and the grub and to note its abundance so as to take adequate protective measures. For example, if there is a heavy flight of May beetles—and this can be expected in April and May, 1917—farmers should use lantern traps at night and spray trees with arsenicals to destroy beetles feeding and breeding on them. Next, in the fall of 1917, grass and small grain should be plowed previous to October 15, 1917, to destroy the young grubs hatched from the eggs of the beetle.

Where the land shows small grubs in the fall of 1917 the owner should plow it thoroughly prior to October 1st and seed it to small grain or clover for the following year. Corn or potatoes should not be planted on such land the following season. Hogs should be pastured on it and chickens allowed the run of the fields when plowed. Finally, if in the spring of 1918 small grubs are abundant, heavy damage may be expected during the coming summer. Seed such land to small grain or clover. Do not plant corn or wide-row crops on such land. Put corn, potatoes, field beans, etc., on ground clean cultivated the preceding year. Pasture hogs on the infested ground at any time, but more especially between April 15th and October 15th, as they do much to root out and destroy the grubs.

Rotations are especially important in avoiding grub injury. A rotation of oats, clover and corn has proven very satisfactory in some sections. Ground which is in corn or has a heavy stand of pure clover during the year the beetles are flying, which will be 1917 in the infested area referred to, will ordinarily contain few grubs, since the beetles will not seek such land for laying their eggs. The beetles prefer land in small grains, timothy or covered with weeds for egg laying. Land which is in oats during the flight of the beetles will contain many grubs, but if clover, which is one of the least susceptible crops, follows, the grubs will scarcely injure that crop. It is asserted that clover winter kills badly in southern Wisconsin, northern Illinois and similar latitudes, but there is reason to believe that winter-killing is due to the fact that the clover is not sufficiently strong to survive severe winters and the remedy is liming or otherwise treating the land so as to grow a vigorous stand of clover. Aside from this rotation it is desirable to so arrange the crops that the least amount of land will be in timothy and small grain the year the beetles (1917) are abundant, and the following year (1918) to plant corn on corn ground and use for small grain and timothy the ground which was in these crops the previous year.

To Inoculate Seed.

Coating the seed of legumes with inoculated soil before planting is a simple method of insuring the soil inoculation at slight cost. County agents in Illinois have found ordinary furniture glue effective in holding particles of inoculated soil to the seeds. This method gives each individual seed some of the particles of inoculated soil which it carries with it when it is planted. The scheme requires but a small amount of inoculated soil and costs but a few cents an acre. The method is described in Farmers' Bulletin No. 704 of the United States Department of Agriculture as follows:

Dissolve two handfuls of furniture glue for every gallon of boiling water and allow the solution to cool. Put the seed in a washtub and then sprinkle enough of the solution on the seed to moisten, but not to wet it (one quart per bushel is sufficient) and stir the mixture thoroughly until all the seed are moistened.

Secure the inoculated soil from a place where the same kind of plants as the seed are growing, making sure that the roots have a vigorous development of nodules. Dry the soil in the shade, preferably in the barn or basement and pulverize it thoroughly into a dust. Scatter this dust over the moistened seed, using from one-half to one gallon of dirt for each bushel of seed, mixing thoroughly until the seed no longer stick together. The seed are then ready to sow.

Wisconsin Farmer Live Stock Advertisements Bring the Business.

Wisconsin Farmer, Madison, Wis:—Call and see us, as we want to fix up an advertisement for you. Your advertising seems to be the one which has reached most of the buyers for us. You may use our endorsement of your advertising all you want to, as your paper sure gets the business.

M'KEVITT BROTHERS,
Breeders of Percheron Horses, Angus Cattle, Duroc Jersey and Hampshire Hogs.

THE above letter was received by The Wisconsin Farmer under date of April 3, 1916. McKevitt Brothers write us that they have sold their Shire stallion and two-year-old Percheron stallion to August Stagman, of Sisseton, South Dakota. This two year old weighed about 1,820 pounds the day he was sold. These same breeders also report to The Wisconsin Farmer the sale of the following cattle: One bull, to Frank Marvats, Eastman, Wisconsin; one bull to R. R. Hughes, Rewey, Wisconsin; one bull to Harry Young, Bridgeport, Wisconsin; one bull to Fred E. Foster, Beetown, Wisconsin; one bull to Walter Scott, Bagley, Wisconsin; two cows to Lou Chouinard, Bayton, Montana.

Other breeders may avail themselves of the wonderful pulling power of The Wisconsin Farmer live stock advertising columns. H. S. Hoard, 201 Washington Building, Madison, Wisconsin, is field representative of this paper in eastern Wisconsin. T. P. Shreve, who may be reached at the same address, is field representative in the western half of the state. Write them for further particulars and rates on live stock advertising.

TOO LATE TO CLASSIFY.

Guernsey Bull For Sale

THE richest of Guernsey breeding. Yearling bull ready for service. Sired by the richly bred bull,

GOODWILL HERO

a son of Imp. Golden Hero of L'Etinnerie, and out of a 526 imported daughter of Gov. of Chene. Dam of bull for sale is Imp. Sundari XXXI, a daughter of Galaxy's Sequel, out of a daughter of Gov of the Chene. Address
Charles Schmidt Wrightstown, Wisconsin

An official order extending to every non-commissioned officer and man in active service in Canada leave of absence not exceeding one month to go out on farms, has solved western Canada's problem of finding help to plant this year's grain crop, in the opinion of government officials in Winnipeg, Can. Under the provisions of the order the soldiers will receive full pay for their service in the army in addition to the payment received from farmers for their work. Free transportation from camp to farm will be provided by the government to the extent of 300 miles and operation of the military order will begin as soon as conditions permit of working the land.

DISPERSION SALE OF HOLSTEIN-FRIESIAN CATTLE

Due to press of other business, will sell my fine herd of pure-bred Holsteins at public auction on

FAIR GROUNDS, ELKHORN, WIS., MAY 9TH

44 Head of females, most all young stock, coming fresh with first and second calf, some yearlings and a few heifer calves. Eight young bulls, three months old to yearlings.

THE BLOOD LINES of this young stock are all that could be desired; the near ancestors on the dam's side are such cows as Pontiac Order, 21.03 lbs. butter, 7 days; Duchess De Dikkert, 20.20 lbs., 7 days; Alice De Vries De Kol, 21.61 lbs., 7 days; Gerben 7th, 20.20 lbs., 7 days; De Dikkert Johanna, 14.80 lbs., 7 days; Brookside Akkrum, 16.30 lbs., 7 days, and others just as good. Near ancestors on sire's side are Sir Topsy Pontiac by King of the Pontiacs, his dam Aggie Topsy De Kol, 29.57 lbs., 7 days; Paul Calamity De Kol, his dam, Calamity Jane, 29.57 lbs., 7 days. De Kol 2d's Butter Boy 3, his dam, De Kol 2d. Homestead Hengerveld De Kol and other good sires. It is rarely such a fine lot of young stock is offered at a public auction; all are well grown, good, thrifty stock, tuberculin tested and sold with a guarantee to be as represented. Remember the date, May 9th, just after the Watertown and Lake Mills sales. If you do not find what you want, come to Elkhorn, May 9, 1916.

A. J. PIERCE - - - ELKHORN, WISCONSIN

ABERDEEN ANGUS CATTLE.

ANGUS (PRIDE) BULLS

AROUND a year old, sired by Patna by Imp. Proteros, dam Pride McHenry 28th. Dams of the Pride, Erica, Heatherbloom and Dutchess families. A show bull in the offering. Prices right.
HAUK BROS. **CASSVILLE, WIS.**
30 miles up river from Dubuque

SHORT-HORN CATTLE.

THE AMERICAN SHORT-HORN BREEDERS' ASSOCIATION

THROUGH its extension department placed in 1915, 1,500 registered Short-horns in sections that would not, otherwise, have been reached. The demand for both beef and milking Short-horns is general from coast to coast, due to the increasing recognition of the practical, adaptable merit of the Short-horn. The service of the association's extension department is free to you. Ask for THE SHORT-HORN IN AMERICA, just out. It is free. Address, American Short-horn Breeders' Ass'n, 13 Dexter Park Ave., Chicago, Ill.

Old-Time Automobiles.

A VERY interesting little booklet entitled "The Final Proof" has come to the editor's desk. This booklet attracts our attention especially because it contains the pictures of a number of automobiles which have been run for many thousand miles. An automobile which is shown in this book, and which is the property of F. E. Slason, of Plainsville, Kan., has a record of 261,800 miles. There are several cars shown in this book which have run over 200,000 miles. The book is issued by the Hyatt Roller Bearing Company to emphasize the value of their product. Each one of the old cars pictured in this book is equipped with Hyatt roller bearings. In each case the cars are still running on the original bearings. Certainly no better evidence of the value of the Hyatt product could be shown than this long service. Readers of this paper may secure a complimentary copy of this interesting little booklet by addressing the Hyatt Roller Bearing Company, Detroit, Mich. Please mention this paper when you write. —Adv.

Record Increased.

BENJ. BERG, Lake Mills, Wis., writes as follows, under date of April 11th: "As requested when you were here I am sending you the latest report on Lady Oak 2d De Kol. She has 31.07 pounds butter to her credit today. She is still increasing in milk and holding her test and has been going at a thirty-two-pound rate the last three days." Mr. Berg advertised her bull calf for sale in the April 13th Wisconsin Farmer. At that time we stated that she had only a thirty-pound record, but are pleased to be able to publish the fact that she has increased this record. This young bull will be sold at the Watertown Holstein sale on May 4th and 5th.—Adv.

D. W. EMERSON, ASHLAND, WIS.

Purebred Registered

HOLSTEIN CATTLE

If you are not ready to buy purebred registered Holstein cows for foundation stock, why not grade up your common cows by using a purebred Registered Holstein bull? The Dairy Department of the Illinois Agricultural College has figured that $150 invested in a good purebred bull earns in six years nearly 1000 per cent profit in the increased production alone, not taking into account the increased value of the herd. Can you invest $100 or $200 so that it will pay you more profit? Investigate the big "Black-and-Whites."

Send for FREE *Illustrated Descriptive Booklet.*

IMPORTERS AND BREEDERS OF

PERCHERON, BELGIAN AND CLYDESDALE STALLIONS AND MARES

STALLION BUYERS ATTENTION. For the next thirty days we are going to reduce our prices on all of our big young stallions in order to close them out. We have very large bunch of big ton, rugged stallions running in ages from two to six years that must be sold this season, consequently anyone that is looking for a right good one will save money by writing to us and getting our prices and descriptions before buying. We especially have a very strong collection of Belgian stallions, in weight from a ton to 2,300 pounds, from two to five years old, that should be on some good farms the coming season. We also have ten tried sires, Percherons and Belgians, that we have taken in on trade on younger stallions, that we are offering very reasonable.

We are located in north central Iowa on the C. M. & St. P. R. R., midway between Mason City and North McGregor, Iowa. Send 20c in stamps for large horse calendar which shows our main farm and sales stables. Correspondence a pleasure.

HORSES.

FRANK IAMS'

Iams owns the three largest and best 2, 3 and 5-year-old Percheron Stallions in U. S. weight 2,100, 2,230 and 2,410 lbs., all "Paris and Gold Medal Winners." Iams owns "Dentist," "champion" double "Gold Medal" winning Percheron 3-year-old. Try Iams—"Dad." His Belgians are 'Eye-Openers." We take no chances. He sells horses "On honor" and all his horses will be sold at some price.

Is "closing-out" and has "reduced prices" on all his "Show and Business Stallions and Mares"—from $100 to $500 less than formerly on each stallion or mare—to make a quick "clean-up." He has all his largest and best horses—many "Big Snaps"—"Mr. Buyer," Be a "Self-Starter." 1916 is the "Get-Rich-Quick" year for "Up-To-Snuff" Horse Breeders—Pull the "Spark-Plug"—Plunge into the "Easy-Money Game"—Buy a stallion and a pair of mares of Iams—His "Big Horses" and "Cut Prices" are the "Town Talk." His 34 years of success in importing, breeding and selling 5575 registered horses, his "fifty trips" across the ocean—makes Iams a safe man to buy stallions from. His "old customers" are "best Page advertisers," his Breeding guarantee backed by "½ Million Dollars." Iams' Imported and Home-bred horses are "classy, model drafters" of big size, large bone, fine form, quality and finish. Many

"Gold Medal and State Prize-Winners,"

"Iams' Kind," and in the "Pink of condition." Bought at "Bargain Prices," and must be sold. Iams sells horses on Honor. A lady can buy as cheap as a man. Is not in the "Stallion Trust," and is selling more pounds of "Model Draft Horse" for the money than any competitor. Iams is cutting the middle out of high prices on his choice collection

OF PERCHERON AND BELGIAN STALLIONS AND MARES

2 to 6 years old, wt. 1,800 to 2,410 pounds, all "Branded," "Approved," "Registered" and "Inspected" by Governments of France and U. S., and certificates stamped "O. K." All "Inspected" by a Nebr. Deputy State Veterinarian, and certificates of "Health and Soundness" are given with each horse.

REGISTERED STALLIONS AT $800.00 AND $1,300.00

(Four little higher.) "Home-Breds" come cheapest. Terms cash, or one year's time at 7 per cent: land security at 6 per cent; $100 less price for cash than time. Iams pays freight and buyer's fare; gives 60 per cent breeding guarantee. Can place $1,500 insurance. Iams backs up his ads with $500 guarantee that you find the horses as represented. Write for Horse Catalog. It has a "Big Bargain" on each page. References: First National and Omaha National Banks, Omaha, Neb., all St. Paul Banks, St. Paul, Neb.

ST. PAUL, NEB.

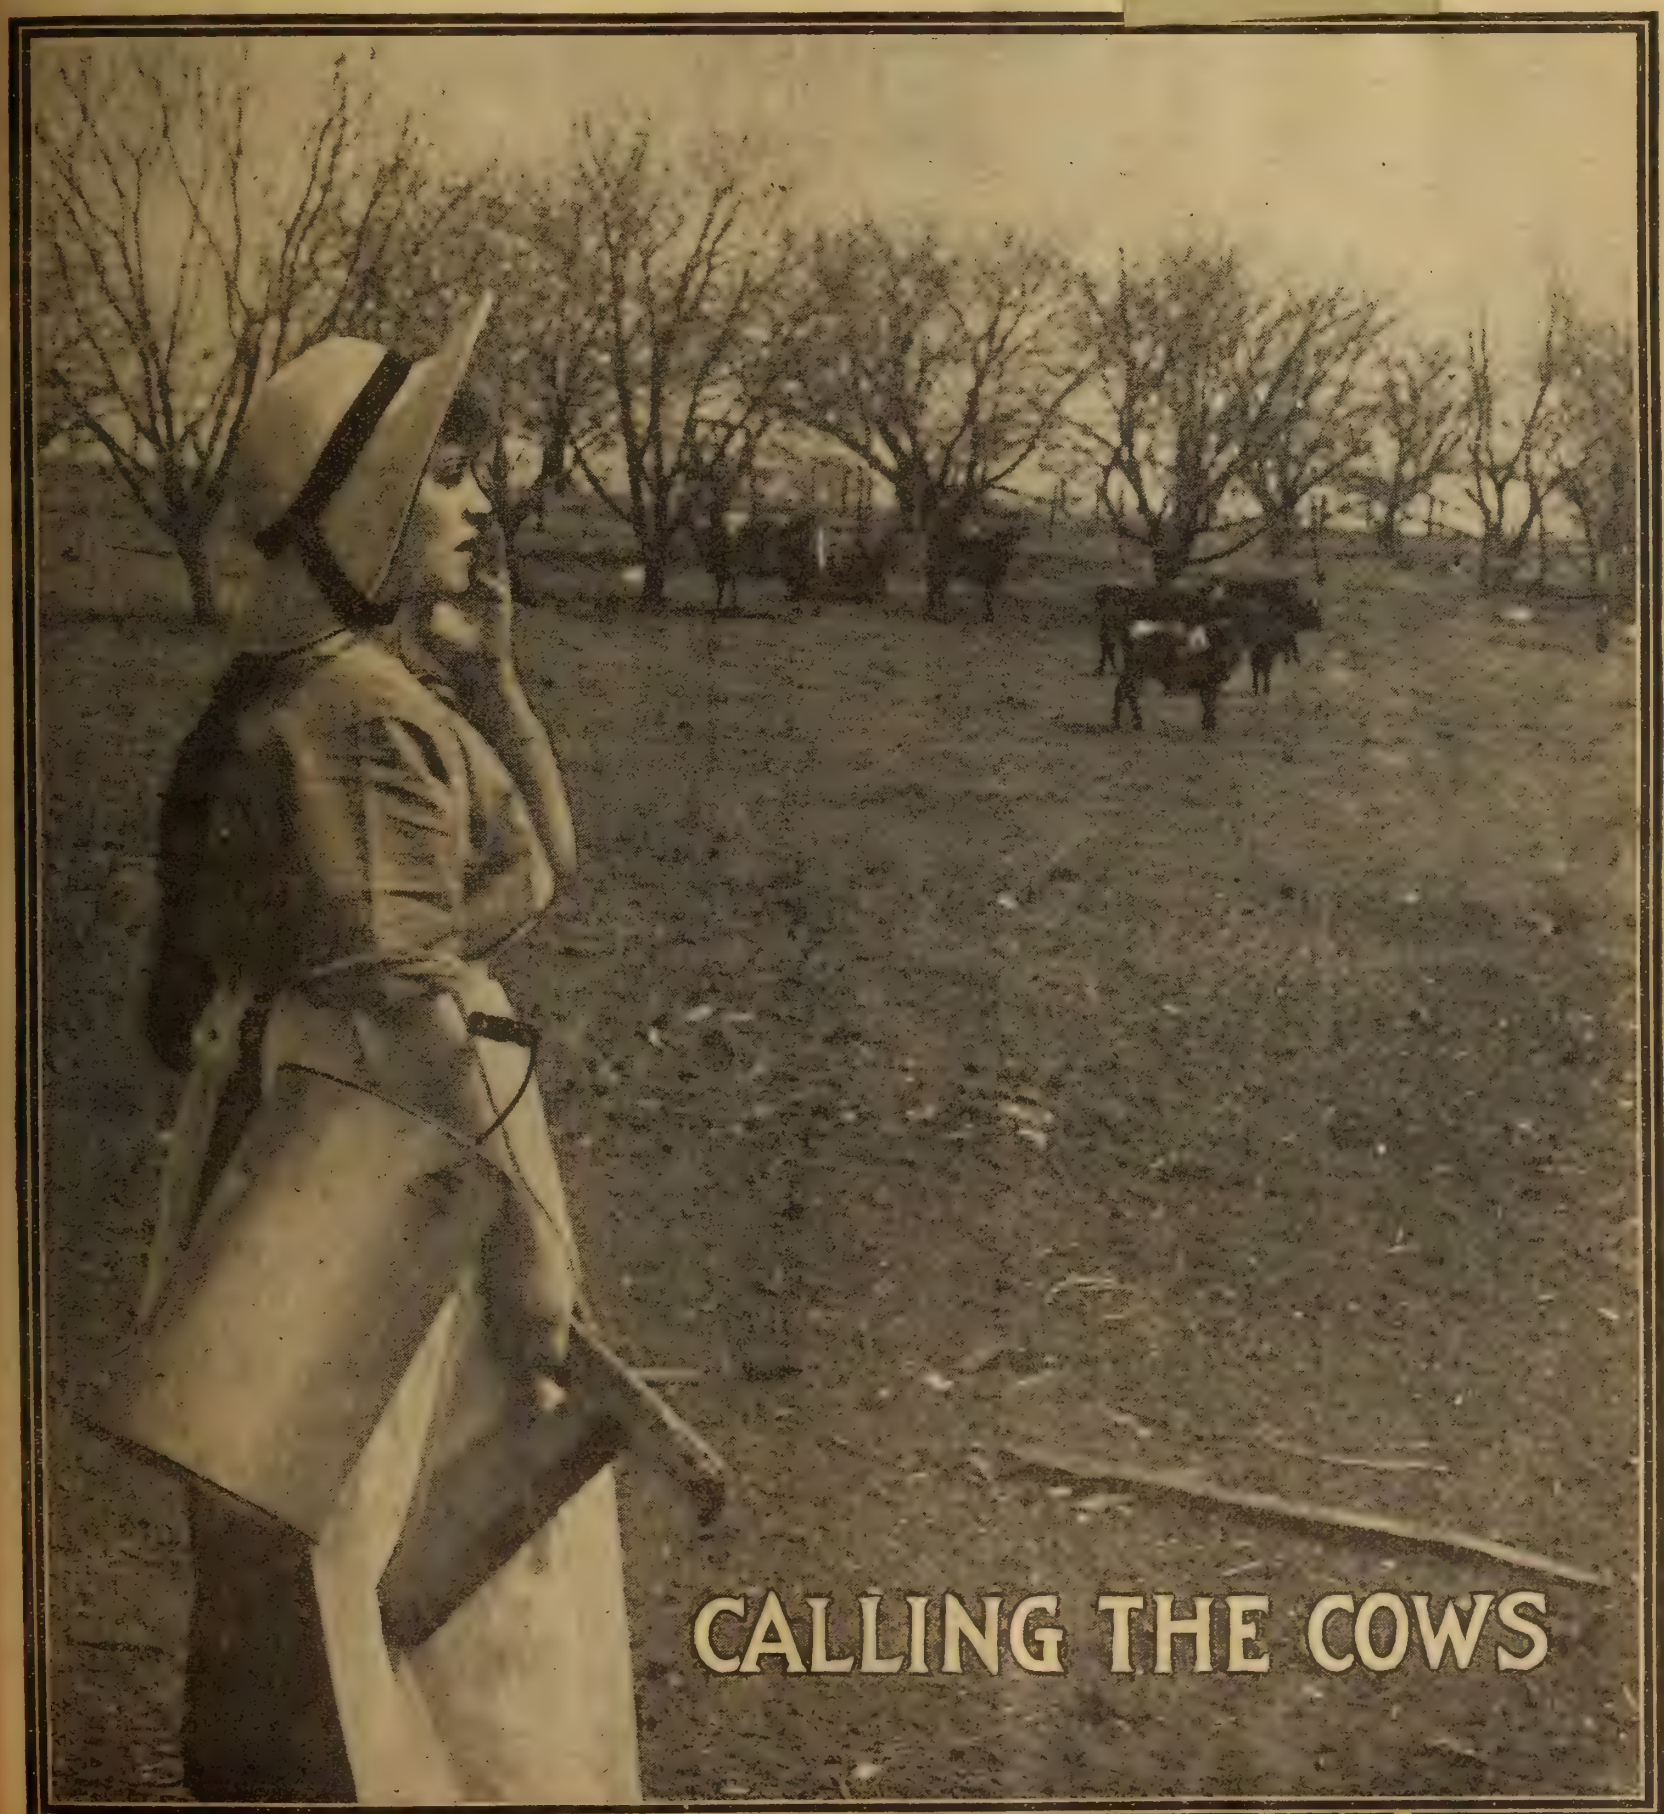
VOL. XLV. NO. 18. THURSDAY, MAY 4, 1916. HOLE NO. 1788



CALLING THE COWS

CURRENT EVENTS

THE fact that Henry Ford, the wealthy automobile manufacturer and peace advocate, carried his home state, Michigan, by a good majority, polling over 25,000 votes, and was the choice of at least 15,000 republicans in Nebraska, has opened the eyes of many people, particularly in the East, to the possibilities of Mr. Ford in politics and to the anti-preparedness sentiment in the middle West. When Mr. Ford was in New York he was interviewed, with the following result: "I think the feeling in this country is against excessive preparedness, lavish preparedness. I believe in reasonable preparedness. But what's the use of building dreadnaughts? They're only good to be sealed up in the Kiel canal or the Orkney Islands. That's where they are, you know; all of them." "Are you going to take advantage of your personal popularity, or the popularity of the things you believe in and run for president?" "I don't know what I might do," Ford replied soberly. "I don't think anyone ought to run for president, or for any other important office. When a man runs for office he generally has a motive. The man for president ought to be picked." Mr. For' was emphatic in declaring that he would not finance any third ticket, no matter how many states might declare for him.

THE German reply to the ultimatum issued by President Wilson in regard to submarine warfare and the danger to neutral ships and travelers had not been received in Washington up to the first of the present week. There were many conflicting rumors, but the one which seemed to carry the most authority was to the effect that the kaiser is expressing a desire to follow a course which will lead Germany and the United States out of the present crisis. Public opinion in Germany remains divided into two factions. One would welcome a break with the United States, simplifying the international situation and making it possible for Germany not only to continue but to increase its submarine activities. The other would maintain the present friendly relations, even making concessions which will restrain the submarines, in a measure, although not dispensing with them entirely. The German reply is expected any day now. In the meantime the fighting continues around Verdun, with no gain for either force. The international situation was somewhat complicated last week by rioting in Dublin, in which several lives were lost. The Irish question had been well-nigh lost sight of in the European war, the Irish enlisting for Great Britain in large numbers. Some malcontents started trouble in Dublin last week, however, and the situation looked serious for a time.

SENATOR J. HAMILTON LEWIS, of Illinois, predicts that another political party will be founded immediately after the national republican and democratic conventions this summer. This new party will be founded on "peace, prohibition and prosperity." Neither of the old parties, he says, can afford to take "any sort of action in international affairs which would show Europe that the country is not backing the administration's policy." A defensive alliance of all countries of the western hemisphere was suggested by him as the only means by which the United States could avoid early conflict with countries of Europe and Asia. "Such an alliance must carry with it a new doctrine of international law," said the senator, "ordaining that any country violating the fundamental rights of the republican form of government would be punished by the combined resentment of the whole western hemisphere." It has been suggested by other public men that after the European war there will be a central tribunal, armed by all the nations, which shall have the power to punish any nation which does not live up to its agreements or to the decisions of this international tribunal, which shall be unlike the present court of arbitration at The Hague in that it will have the men and the guns to enforce its rulings on any nation the world over.

MAJ.-GEN. HUGH SCOTT, chief of staff of the United States army, spent the past week in conference with General Funston, on the Mexican frontier, trying to arrive at a conclusion in regard to the Mexican situation. There were rumors that the American troops were to be withdrawn from Mexico, leaving the task of capturing Villa and dispersing the bandits to the Carranza troops, but these were dispersed by an unofficial statement of General Scott to the effect that the American forces in Mexico were to be strengthened rather than withdrawn. General Obregon, minister of war under Carranza, came north to hold a conference with General Scott, at which it is expected a definite policy will be decided upon. The Carranza leaders are insistent that the United States should withdraw its troops, but this is hardly probable until better order is secured in Mexico, with less likelihood of the Columbus raid being repeated. At last reports it was about decided to retain the American troops to police the northern part of Mexico until the Carranza forces have shown themselves able and willing to maintain order and to keep Villa down with a strong hand.

REPORTS that Col. Theodore Roosevelt might support Elihu Root if Mr. Root obtained the republican nomination for president, were declared without foundation by Judge Albert D. Nortoni, of the Missouri Court of Appeals, after a conference with Mr. Roosevelt. "I know that Colonel Roosevelt will not support Senator Root on the republican ticket," was his statement. "I know that no such support has been promised by Colonel Roosevelt, either directly or indirectly. If Mr. Root is nominated it will simply mean a straight out third party fight right down the line, just as in 1912." Colonel Roosevelt has issued a public statement, vigorously opposing the administration and promising that he, his four sons and possibly two sons-in-law would enlist in the event that the United States became embroiled in war. The colonel said: "Men are saying that they stand behind the president or by the president. I wish to speak for the men who, in the event of war, will stand in front of the president and between him and the foreign enemy, and who, therefore, will stand between danger and the men who are behind or beside the president. These are the men who will go to the war at once if there is war with Germany, or with any other great power, and who feel as I do, that we would far rather go to war unprepared than to see our women and children murdered with impunity and the honor of the flag stained."

SINCE the beginning of the war more than $350,000,000 worth of horses, automobiles and automobile accessories have been exported from the United States, according to a statement issued by the foreign trade department of the National City Bank, of New York. France and her allies received the major portion of these exports. Out of a total of $160,000,000 in automobile exports, $100,000,000 worth were of the commercial and freight carrying type, the remainder passenger cars. The number of horses exported was about 600,000, and of mules 150,000. In the seven months ended in January, last, France alone received 122,000 horses and mules, while Great Britain bought 38,000.

THE German government has agreed to permit exportation to the United States of 15,000 tons of dyestuffs, lack of which has seriously affected American textile manufacturers. Notification to this effect was contained in a note delivered by Count Von Bernstorff, the German ambassador, to Secretary Lansing. The communication explains that, while Germany refused at first to permit exportations of dyestuffs unless they be exchanged for American goods, now excluded from Germany by the British blockade, after careful consideration of the situation it has been seen that "this blockade has resulted in serious embarrassment to those American industries which are in need of dyestuffs," and the imperial German government now is prepared to make "a single exception" in permitting exportation in this instance. It is required only that the dyestuffs shall be consumed by American manufacturers and not re-exported to Great Britain or her allies.

TOMORROW THE TRACTOR'S.

NOTHING is more certain, to my way of thinking, than that the next few years will find the mechanical aids to farming developed and adopted to an unusual degree. Particularly, I believe, will it be the era of the tractor. Let me give you a few facts to confirm my individual opinion.

In the ten years between 1900 and 1910 (when the last federal census was taken) the average value of implements and machinery per acre of improved land in farms increased, in the United States as a whole, from $1.81 to $2.64. The percentage of increase was 45.9. In the same time, here in the grain belt (where the bulk of the farming operations of the nation are carried on) the percentage of increase was 57, while the average increase was 6 cents per acre above the average increase in the United States as a whole. In some of the grain-belt states the supremacy was overwhelming. In Wisconsin, for instance, the census bureau gives the average value of implements and machinery per acre of improved land in farms as $4.45, whereas in the United States as a whole it is but $2.64. In other words, the farmers of Wisconsin are spending $1.81 more per acre for mechanical aids to farming than are the farmers of the nation as a whole. In Iowa they are spending 60 cents an acre more. In South Dakota the farmers almost doubled their expenditure for implements and machinery between 1900 and 1910, the actual percentage of increase being 97.2, whereas in the nation as a whole it was but 45.9. In other words, South Dakota farmers are just twice as quick to see the possibilities of agricultural machinery as are the farmers of America generally.

Now what does all this portend? In my opinion, just this: The ultimate supplanting of brawn by the inventions of brain, the increase in production by more efficient cultivation. I am not predicting that the day will ever come when the work horse and the hired man will no longer be known on the farms of America. But I am predicting a day when agricultural implements and machinery will double our present production, cut the labor exertion and the labor expense squarely in two and increase our farming profits most materially. The short-sighted ones who predicted that the reaper would displace hand labor on the farm altogether, and fought the reaper on this theory, have long since seen the error of their ways and would be the last today to go back to the old order of the sickle and the cradle. Neither the work horse nor the hired man will ever disappear from our farms, yet the day is undoubtedly coming, in my opinion, when we will look back upon our farming operations of today as we now look back upon the operations of a day before the reaper and the binder came.

Take the case of the tractor, for instance. Mr. Phillip S. Rose, editor of The American Thresherman, places the number of gasoline and oil tractors in use today, in the United States, at 20,000. To this he adds 100,000 steam tractors and 1,000,000 gasoline and oil engines, averaging five horse power each. Here we have a total of 9,600,000 horse power developed by these mechanical aids to farming, two-thirds of the power of all the horses and mules to be found on all the farms of the nation. And the day of the tractor is only fairly breaking. Last week the secretary of the Kansas City Tractor Club received a letter from France which is most instructive. The writer points out that after the war Europe will be so short of horses (and they will be so high priced) and so filled with wounded and crippled men who cannot do their work without riding, that thousands upon thousands of tractors will be in immediate demand. He continues:

> Just to give you an idea of the situation, one school here, representing the people for a certain section of France, is now training 1,300 maimed men to handle tractors with which to do farm work and every other sort of work that the tractor does. These are thirteen hundred out of thousands and tens of thousands of men who must have tractors and cannot afford horses. They will be bought in vast quantities.

Stricken Europe will naturally turn to the tractor to solve its land cultivation problem, for a crippled man who cannot plow and cultivate on foot can sit upon a tractor and operate it effectively. The tractor will restore and increase the fertility of Europe's blood-stained fields. But what will America be doing all this while? To meet the new competition it must adopt the new methods to a still greater degree than Europe adopts them. For every tractor put in use on Europe's farms a half dozen, yes, a dozen, must be put to use on America's farms. In no other way can our efficiency and our production be increased so as to maintain our agricultural supremacy.

I am not a prophet, nor the son of one, yet I freely predict that the next census will find the percentage of increase in the use of mechanical aids to farming far greater than the last census found it, and in this I see a good sign of the times. The day is coming—and rapidly, too—when our agricultural supremacy will not depend upon new lands being put under cultivation, but upon the increased productiveness of our old lands. The agricultural implement—and particularly the tractor—will be the dominating factor in bringing this new order about.

THE COST OF WAR.

I HAD the pleasure, the other evening, of talking for some time with a man who has spent the last five months in Europe, visiting practically all the belligerent countries and meeting many of the high officials whose names are constantly in the press dispatches. This man returns to the United States, and to the grain belt, a most determined pacificist, for he has seen war's horrors and realizes full well the intensity of the suffering which war entails.

I want to tell you a few things this man told me of the cost of the present war. He has carefully figured it out and has learned that the amount spent on the war so far—with no immediate end in sight—would build a comfortable home for every family in France, Germany and England. Think of that, you who would embroil this nation of ours in the titanic struggle for little or no reason and sacrifice millions of human lives—your sons and mine—in a conflict in which no great principle (worth the dying of a single man) is at stake so far. But this does not bring the matter as close home as another remark made by my friend. He tells me that every time a large gun is fired—and they are fired every minute of the day, by the thousands—the cost is as great as that required for the education of two young men for five years in the best universities of the world. Think of that, you fathers and mothers of the farm who toil and skimp for years in order to get enough money together to send the boy or the girl to the state agricultural college for a year or two, that they may have the advantages denied you in your youth. Is war worth more than the education of every young man, of every young woman, in this fair land of ours? I answer, "No," most emphatically.

I have just been reading some facts contained in a booklet issued by one of the big eastern banks. From this booklet I learn that two years of the war (it will be two years the first of August since the war began) will cost six times more than the full amount expended in the civil war, will reach a sum forty times more than the amount of our national debt, and will be 120 times more than the cost of the Panama canal. And yet there are among us some who would throw the stars and stripes into the international cockpit, dyeing it a still deeper red in the blood of our best young manhood. Shame on them for such awful blood-lust.

My friend holds views which I have long held, and frequently expressed here. He believes that Europe will be in no condition, nor have any desire, to enter into any other war for the next 100 years at least. Twenty million men are under arms (or, having been under arms, are now under the sod) in Europe. Once peace is declared nothing will be dearer to them than the shade and happiness of their own rooftree; nothing will be able to lure them from the pursuits of peace to the murderous slaughter of the trenches. Nor will the children of today, nor their children, be any more anxious for war, for this titanic struggle will leave scars which it will take fully a century to efface. We of the United States are in no danger of foreign invasion for the next 100 years at least.

Let us think of these things, coolly and calmly, as we go about the spring's work of another crop year. If we keep cool heads we can hold the war-mad ones in leash. Could we dedicate ourselves to a better, a nobler task?

HELP WANTED.

I HAVE frequently spoken of the pleasure derived by me in opening and reading the mail, from the intimate heart stories revealed by the letters of my farmer correspondents. Without violating any confidence in the least, I am going to reprint herewith portions of a letter received a few days ago. This letter was written by a young Wisconsin woman, the daughter of a farmer, who is good enough to say that she has read my editorials "until I feel that you are a personal friend," while "father reads your paper from cover to cover." Having thus established themselves as close friends, is it to be wondered at that I am most deeply touched by the recital of their troubles, which follows:

> Dear Mr. Pierce:—We have a beautiful farm of 300 acres which was almost free from debt when father helped a brother, who did not prove worthy, and now at seventy-eight finds himself heavily in debt. When mother died, sixteen years ago, I came home to keep house, have taught school and kept house ever since, but with hired men of every type, things have gone from bad to worse and I cannot pay the debt, taxes high, help too, and father not able to do much more than the chores. Father and mother came on to the farm fifty-seven years ago, so you can readily see how we cannot give up. Something within tells me to hold out, but it takes money and that right now. We tried advertising for help and found that worse than the poorest help we could hire right here. If we could rent to a thorough, up-to-date young farmer who would put the farm on a paying basis, that is what I would like to do, but where find him? Do you, through your experience, know of such a person? If so, will you kindly let me know about him. If we could sell 120 acres we could manage to pull through. Do you know of someone who would like to start a dairy farm? This 120 is particularly adapted to that purpose. I will appreciate advice and help.

A letter like this makes me realize the inadequacy of any words at my command to express my sympathy. It fairly makes my heart ache to think of this young farm girl struggling along against such heavy odds, of the sleepless nights she must put in trying to devise ways and means to save the old home place. The best I could do was to write her a letter of sympathy and general advice, of which the following is a portion:

> I can fully understand why you encounter great difficulty in operating your 300-acre farm with the kind of help that is available in this day and age. I take it for granted that you do not have a second house on the farm so that you could hire a married man. This plan sometimes works out quite well, because an individual who has a permanent home is apt to give better service than one who is here today and away tomorrow. Of course it is too late to rent the land this year unless you could lease it to a neighbor. While it might not be practicable to do this, still I make the suggestion.
>
> When the present crop season is over you will then know how you are coming out financially and if you cannot meet your maturing debts you should certainly plan to sell 120 acres. In the meantime, your financial situation should be explained in detail to your local banker, as I feel sure that his advice would be of material aid to you. If you should have a few small nagging debts he might be willing to loan you money to pay these off and take your note for a six-month or eight-month period. This would relieve you of worry and in the meantime you would have an opportunity to get something from the land.
>
> I only regret that I cannot refer you to a purchaser for your 120 acres. It is just possible, however, that you might offer this acreage for sale through a reliable real estate agent. Such persons have a much better opportunity to find a purchaser for land than the individual who is not engaged in that special line of endeavor.

The whole trouble resolves itself down to this: The inability to secure good farm help. If this young woman and her aged father could only get the right man to take hold of the place and work it on shares—a tenant with a family, every member of which would have an interest in restoring and maintaining the productiveness of the place—their troubles would be well-nigh ended and the rest would take care of itself in time. I am not a pessimist altogether on the labor question, but my farmer friend who asserts that when he advertises for help and twenty men apply he hires them all, knowing that only one (if any) will show up at the time appointed, is about right. Our future agricultural prosperity depends as much upon this element of available and efficient labor as upon any other factor. No matter how fertile and productive our acres are, if we cannot get the labor to till them our capital is invested and our own efforts are expended to but small avail.

Could I answer my young correspondent in any better manner? Should I have gone further? Did I go too far in encouraging her to hold on to the old home place? I will gladly receive suggestions, for by co-operating together we may be able to lift the burden from this young woman's shoulders and put an end to the worries which, I have no doubt, are making her old before her time and saddening the sunset years of her aged father, who sees a life of hard and honest toil thus brought to naught. May we not join in this effort to make two smiles bloom where there were none before? For surely, thereby, we would be doing better than merely making two blades of grass grow where there was only one before, of which the Good Book tells us.

James M. Pierce

THE WISCONSIN FARMER

A WEEKLY JOURNAL OF AGRICULTURE, HORTICULTURE, STOCK RAISING AND ALLIED INDUSTRIES

BY JAMES M. PIERCE

JAMES ATKINSON, Editor-In-Chief

ESTABLISHED IN 1848

Entered at Des Moines Postoffice as second-class matter

PUBLISHED EVERY THURSDAY

1912 Grand Ave. Des Moines, Ia. | 201 Washington Bldg. Madison, Wis.

To either of which communications relating to subscription or advertising may be addressed.

MEMBER AGRICULTURAL PUBLISHERS' ASSOCIATION
MEMBER AUDIT BUREAU OF CIRCULATIONS

SUBSCRIPTION RATES—Single subscriptions, $1.00 a year. In clubs of ten, 75 cents a year and an extra copy to getter up of club. In clubs of fifty or more, 25 cents a year. Single subscription three years in advance, $1.50; five years in advance, $2.50; ten years in advance, $5.00. Subscription prices in Canada, $1.50 a year. Remit by draft, registered letter, postoffice or express money order. In changing address, send both the old and new addresses. In renewing, give the same name and initials as you gave before or state both the old and new names, and explain why you make the change. In case of errors or failure to receive the paper within two weeks, promptly notify the publisher. Address WISCONSIN FARMER, MADISON, WISCONSIN

Support Your Country Newspaper.

NOT long ago one of the editors of The Wisconsin Farmer attended a gathering of advertising men in which the country newspaper was a subject of discussion. It was surprising to note the dense ignorance which these men displayed with reference to the power of the country press. They were all convinced of the great value of farm journals as advertising mediums. They were very certain of the value of the magazine with national circulation and of the city daily. They regarded the trade paper with favor. But a goodly number of them failed to grasp the importance of the country newspaper.

This was partly due to the fact that most of the men in the meeting had been born and raised in the city. The privilege of spending part of their lives on a farm or in a rural community had unfortunately been denied them—a thing which we believe is a very serious loss to any man.

The country editor and his paper need no defense from us, but we cannot help saying that the community which does not support its local paper is missing a wonderful opportunity. The local paper cannot carry all the news of the world; it cannot fill the need for a farm paper that exists in every farm home; it cannot furnish the comic supplements or illustrations of the Sunday papers and magazines—and it does not pretend to do these things. But it has a field all its own and it supplies a need which no other publication can meet. The country paper which fills its mission is a power for good and a beloved institution in every home into which it goes.

Every farmer should support and read his county paper. In no other medium can he learn the facts regarding the happenings in his community, with its record of marriages, births and deaths. No other paper brings him news of the sick in his neighborhood or informs him of the date and hour of his social, business, religious and political gatherings. Nowhere else can he learn of the bargains which the local stores have to offer or of the thousand and one little things of the most intimate concern to himself and his family. In no other way can he keep posted on local matters of vital interest to him as a public spirited citizen and taxpayer. There is no substitute for the country newspaper—no other means of publicity and information can ever take its place.

Of course there are good country newspapers and better country newspapers, but it is almost always true that the best ones are those that receive the most loyal support and interest of the community in which they circulate. Where there is a spirit of co-operation among his readers there is very likely to be an editor who will respond to the demand for a good, live, clean, home paper. The country newspaper man who has the necessary energy and ambition may make a success without much help from his readers, but he can do it much easier and much better and have more time and enthusiasm to devote to the community interests if he has the help of all the members of his community.

The farmer who gets a good country weekly for $1.50 a year should consider himself fortunate and should always keep his subscription paid in advance. Country newspapers should be sold for cash and there ought to be no difficulty in getting cash for them, because they are worth much more than they cost if they are well edited, as most of them are. There are dozens of country newspapers throughout Wisconsin that are to be counted among the greatest powers for good in the communities which they serve. Such local Wisconsin papers as the Fennimore Times, Dodgeville Chronicle, Elkhorn Independent, Hartford Times, Waukesha Freeman, Sauk County News and others we might name, are worth many times their cost to the farmers of their communities. We mention these papers in particular because of the enterprising way in which they handle the news and the interesting matter with which they are filled. If your local newspaper is like these just mentioned, give it the support it deserves; if it isn't, help it to become better by giving it the support which it needs.

Report of Wisconsin Crop and Live Stock Conditions.

THE WISCONSIN FARMER presents this week a new department under the heading, "Crop and Live Stock Conditions." Our aim will be to give concise, accurate reports weekly covering all the counties of the state. This will be extended eventually to cover some of the border counties in adjoining states. The reports which will be presented will be independent of state or government reports. Exclusive reports are received weekly from each section of the state. In response to requests from this paper a number of the very best farmers of Wisconsin have agreed to assist us in this matter, and we take this early opportunity of expressing our appreciation of their efforts.

Wisconsin farmers produce nearly $350,000,000 worth of farm products in a year, and this is by far the most important single industry in the state. The condition of the business pulse of the state is most faithfully represented by an accurate estimate of the crop and live stock conditions. The Wisconsin Farmer believes that no accurate estimate of these conditions can be secured without individual reports from farmers who will cover only a limited area. In brief we expect that each one of our reporters will have intimate knowledge of the entire section concerning which he makes a report. By collaborating these reports we expect to get a fair estimate each week of the crop and live stock conditions in this territory.

The varied branches of the farming industry in Wisconsin will be taken into consideration by our reporters. In counties where tobacco is a leading product special mention will be made of the condition of that crop. Where potato growing is the chief industry our reporters will take that into consideration. The same may be said of the cabbage sections and the cranberry growing sections. The condition of corn and small grain over the entire state will be reported regularly.

Special effort will be made to report accurately the condition of pasture and forage crops. The reports on live stock will come from men who understand the live stock business and who have a special acquaintance with the dairy industry. While the state and federal governments have given very accurate reports on grain and other crops, no comprehensive reports on live stock conditions in Wisconsin have ever been available from week to week. The Wisconsin Farmer hopes to make the reports such as will be of great interest to every reader. In this connection, if any of our readers have suggestions to make from time to time which will aid us in bettering these reports, we should be very much pleased to receive them.

Consolidated Schools in Wisconsin.

THE WISCONSIN FARMER receives a good many inquiries relating to the subject of consolidated schools. Those of our readers who have particular interest in this subject will do well to secure the Educational News Bulletin for May 1, 1916. This is the consolidation school number, and some very interesting facts concerning the subject of consolidated schools in Wisconsin may be found in this bulletin. Copies of the bulletin may be secured by addressing the state superintendent, C. P. Cary, care Wisconsin State Department of Education, Madison, Wisconsin.

Most of our readers are interested in knowing just how country school districts may be united. Mr. W. E. Larson, of the Wisconsin State Department of Education, answers this question in the bulletin above referred to. One method is for at least 5 per cent of the electors in each of two or more contiguous districts to petition the school boards to bring the question of consolidation before the people of the district for a vote. The election date must be the same in all of the districts, and a majority of the votes in each district is necessary to carry the proposition. In the event the proposition does carry in all of the districts then, under the law, the districts have consolidated themselves.

The second method of consolidating rural school districts is by union of the town or village boards in whose jurisdiction the interested districts are located. These boards may initiate the subject of consolidation on their own motion for two or more districts. They proceed in the same manner that they would to make alterations in school district boundaries. A hearing, however, must be granted after due notice so that all persons favoring or opposed to consolidating may have an opportunity to be heard. The decision of the board after the hearing is final. However, any person who may consider himself aggrieved by the action of the board may appeal to the county committee of common schools. In the event that the decision is still unsatisfactory further appeal may be taken from the action of this committee to the state superintendent of instructions. A special statute provides that the matter of consolidation may be brought before town boards upon a petition of one-third of the voters in each school district which it is proposed to unite, and upon presentation of this petition to the president of the town or village boards, said officer is required by law to call a meeting within twenty days and act upon the petition. In the event the president of the town boa refuses to call a meeting action may be taken ov his head to the state superintendent of publ instruction.

Districts which establish and maintain conso idated schools receive state aid as follows:

If two or more districts consolidate and establis a one-room school, the state will pay one-half th cost of the building and equipment not to exce $1,000.

If two districts consolidate and establish a tw room graded school, the state will assist in the erec tion and equipment of the school building not to ex ceed a total of $1,500.

Under the same rules, $2,000 is the maximum for three-room graded school; $3,000 in the event of th consolidation of three districts and the erection of school with four departments; $5,000 in the event o the consolidation of all the districts in any town an the establishment of a high school in addition t grades. In each case the state aid sum must no exceed one-half of the total sum expended.

State aid for the matter of transportation in cludes reimbursement of the district at the rat of 10 cents per mile per day for each child trans ported not more than two miles; not more than cents per day for each child transported more tha one mile but not more than two miles. The law makes it compulsory for the district to transpor all children living more than two miles from th school. Children living two miles or less may b transported. In case of consolidation of district by the town board, state aid is available for th transportation of children beyond the two-mil limit only.

In the matter of maintenance state aid is avail able for consolidated schools as follows:

To schools having two departments, $200 a year schools having three or more departments, $300 year. To state graded schools or other schools giving work in agricultural and industrial subjects des ignated by the State Superintendent, an additiona $100 per year is granted. In case a high school is maintained in a consolidated rural school district the state will pay one-half of the cost of instructio not to exceed $900 for a principal and one assistant $1,200 for a principal and two assistants; and $1,50 for a principal and three or more assistants.

Our Wisconsin farmers are divided on the question of consolidation, but many believe it is the final solution of the rural school problem. To such as are favorable to consolidation these pointers will be of interest.

Wisconsin Land Clearing Tour.

WITH county representatives, bankers, business men, farmers and school men busy in the interests of the land-clearing demonstrations, the success of the "Stumping Special" which will tour twelve counties in Upper Wisconsin next month is assured.

Local committees in every one of the places on the route of the land-clearing train are making extensive preparations to entertain large crowds of farmers and settlers during the demonstrations. Plots of land about ten acres in area have been secured at each point, located as near the railroad as possible for the convenience of the demonstrators.

The six co-operative companies that are allied with the college of agriculture in furthering the work will ship their land-clearing apparatus and materials to Madison, where the train, consisting of one flat car, two box cars, one boarding car and bunk car, will be equipped and furnished for the trip.

The complete schedule for the portion of the tour over the lines of the Chicago & Northwestern railroad has been arranged. The exact itinerary and time table for the latter half of the excursion, which will be on the Chicago, St. Paul, Minneapolis & Omaha lines, has not been finally decided, although it will probably include a number of stops of two days each in Bayfield, Douglas, Barron, Washburn, Sawyer and Chippewa counties.

Mountain, Oconto county, May 8th and 9th.
Deerbrook, Langlade county, May 11th and 12th.
Elcho, Langlade county, May 13th and 15th.
Crandon, Forest county, May 16th, 17th and 18th.
Three Lakes, Oneida county, May 19th, 20th and 22d.
Eagle River, Vilas county, May 22d, 23d and 24th.
Woodruff, Vilas county, May 25th and 26th.

From Woodruff the train will proceed to Ashland, where it will be turned over to the officials of the Chicago, St. Paul, Minneapolis and Omaha railroad for further transportation to other points in the cut-over country.

Interest which has developed during the past two weeks indicates that it will be one of the most interesting affairs in the history of the sate. This demonstration will be under the supervision of the engineering department of the college of agriculture, with the co-operation of the manufacturers of stump pulling machinery and explosives. The original plan was to hold on an average two demonstrations a week for about seven weeks, but the demand that is now being made upon those in charge indicates that it will be continued for a longer period.

This is the first demonstration of its kind ever held in Wisconsin, and so far as we know in the United States. When it is realized that stumps are keeping over 7,500,000 acres of splendid land from cultivation in Wisconsin it is readily seen how important such a demonstration might become and the importance has only dawned upon many communities in the last few days after the plans had been largely completed. Communities which were tendered an invitation for a demonstration last winter when it was not believed the tour would be of much interest and using all kinds of means

o secure a demonstration. This change in sentiment follows a keen interest throughout the upper alf of the state and the result is that many communities will have to be disappointed. Mr. Carl ivingstone, who is in charge, says that sufficient owns have asked for demonstrations to keep the lemonstrators going without a breathing spell until rost. At the beginning it was doubtful if enough communities would co-operate to make it successful.

The farmer and the landowner with stumps to remove cannot afford to miss these demonstrations. They will be held near the stations in the towns set forth above and the strict rules set down for the manufacturers of stump pullers and explosives to follow make it sure that the work will be done under actual working conditions. This will not only afford the owner of stump land an opportunity to learn how to remove these barriers to cultivation, but it also gives him the chance to look over the equipment on the market and determine for himself which puller he can afford and which he would prefer to buy. The rules require that at least the equivalent of two three-hour periods will be set aside during which the exhibitors will be expected to operate under practical working conditions. The men doing the actual work are not to be interfered with by either their own agents or the spectators. The spectators, of course, are at liberty to watch the machines in progress. At the end of this time the land must be cleared as far as the work has progressed. Each outfit must clear as it goes and allow neither roots nor small stumps to remain in the ground that would interfere with the plow, excepting snags that would have to be cut off before being pulled. All dirt must be removed that would interfere with the complete burning of the stump when piled. It would be advisable to pile as much of the material as is possible. To do so would make a better showing. At times other than these three-hour periods, the agents of the manufacturers may demonstrate the merits of their products, talk with the farmers and otherwise operate their machines on tracts set aside for the purpose. It is expected, however, that the demonstrators will keep at work most of the working day.

For Better Horses in Wisconsin.

DR. A. S. ALEXANDER, of the Wisconsin College of Agriculture, has written an interesting story on the subject, "Draft Horses Produce Bank Drafts" for the May Wisconsin Bankers' Farm Bulletin. He leads his article with this very significant statement:

Wisconsin possesses the necessary condition for the breeding and raising of fine horses. The 1,271 grade and scrub sires now in use prevent proper progress.

After presenting this general indictment Dr. Alexander proceeds to particularize as follows:

Grade and scrub sires beget scrub horses which cost as much to raise as those from pure-bred sires and sell for far less money. The good brood mare is prolific. Her foals prove profitable and replace her when she dies. Well developed, sound, high-grade horses are needed on every farm and are in demand at remunerative prices for work in the woods and in the cities. The supply of such horses has never equaled the demand and the demand promises to be more active than ever at the end of the war. Misfit, mongrel and nondescript horses, largely the get of grade and scrub stallions, from unsuitable or unsound mares, are, always have been, and will remain a drug on the market. Farm land is rapidly increasing in value. Feed is high in price and farm help scarce and expensive. It does not pay to produce anything but the best products possible on our farms. Why waste time, feed and money in producing scrub horses from grade and scrub sires. Stop such foolish and ruinous practices this spring. Choose only sound, good-tempered, well-developed mares, for breeding, and mate them only with sound individually excellent pure-bred stallions that are kept efficient and prepotent by adequate work or exercise instead of pampering.

Practically every reader of The Wisconsin Farmer realizes without being told that every statement which Dr. Alexander makes is true. How many are going to heed this new gospel of better farm animals. Dr. Alexander is making a determined effort to lead in the right path. The bankers are dispensing information at their own expense and without promise of direct reward. Will the farmers who get the bulletin and who know that what it says is absolutely true, so arrange their practices as to follow the advice given by Dr. Alexander?

Surveying a Farm Before Purchase.

MR. J. S. McDOWELL, in the United States Department of Agriculture Yearbook for 1915, has given us some interesting pointers on purchasing a farm. In brief, the buyer must be careful that he is not charged an acre price on a quarter section for instance, on the basis of the best portions of the quarter. He cites an instance where a farmer was about to buy 160 acres at $100 per acre. This appeared to be a very reasonable price for a farm in the region where the farm was situated, and it was a very reasonable price for the productive part of the farm. A careful analysis, however, brought out some very interesting facts. Eighty acres of the quarter was a rich, sandy loam, not stony, nor rough, but gently sloping, well drained, etc. There was no doubt about this land being worth $100 an acre. In fact, in figuring the value of the properly the prospective buyer put this portion of the farm in at $125 an acre. He found that thirty-five acres of the piece was poor pasture land, wet land that might be drained but probably not at a profit, and he figured that this land would actually produce to the extent that it could be valued at $10 an acre. The remaining forty-five acres he found was very poor land, sandy, stony, rough, hilly, and had little or no producing value. This land he figured in at no value at all. Adding $2,450 for the improvements, this buyer arrived at a total estimated value of the farm as $12,800. This would be at the rate of $80 per acre for the entire farm. While good land generally in the neighborhood was easily worth $100, a more careful survey proved that this particular piece of land had eighty acres away below the average in producing value.

Studying a farm before purchase may be carried even further in itemizing the value of improvements to be sure that there is enough improvement value to bring up the cost per acre to the price asked. But the main point of interest is the producing value of the land, either in crops or pasturage. In Wisconsin in a great many places the value of the timber must also be taken into consideration.

Keeping the Swine Record up to Date.

IT IS a simple matter for those who have never had experience in handling pure-bred hogs to get records of breeding so thoroughly mixed up that they cannot be straightened out later on. Where many sows are kept the breeder seldom trusts his memory, so that the chief danger is found in the case of those who have but three or four brood sows.

There is only one safe rule to follow and that is to ear mark little pigs before they are twenty-four hours old, and make a record of the markings in a book kept for that purpose. A recent issue of this paper contained ear illustrations showing how to avoid complications that are sure to show up in the absence of some such plan. It will be remembered that litter No. 1 is marked with one notch on the lower side of the right ear, litter No. 2 is marked with two notches in the same location. Litter No. 3 is marked with one notch on the left ear. Litter No. 4 is marked with one notch on the left ear and one on the right, while the mark for No. 5 is one on the left and two on the right. This system may be continued indefinitely, simply bearing in mind that a notch on the lower part of the left ear represents "three," and a notch on the lower part of the right ear represents "one." The tenth litter is marked with one notch on the upper part of the right ear, and all litters between ten and twenty are similarly marked and, in addition, the same markings are used on the lower portions of the ear as were used between one and nine.

A page should be given up in the record book to each sow. When she farrows, the total number of pigs in the litter should be recorded, also the number saved and the sex, and it goes without saying that the ear mark of the pigs in this litter should be recorded also on this page. We have known instances where pigs were marked in the same way as their dam, but this is a mistake, and some plan should be followed by which even a stranger could go into the herd and determine from the records and the ear marks the breeding of every pig.

We urge upon the attention of our readers the importance of keeping a private herd ledger right up to date. If a pure-bred sow is not registered before she farrows she should be recorded at onee, because this places the breeder in position to furnish pedigrees promptly when he makes sales from his young stock later on. Almost endless delays are sometimes due to the fact that the foundation stock is not kept recorded, so that when sales are made the buyer's patience becomes exhausted in some cases before he receives his pedigrees. By following the plan that we have suggested of having the breeding stock all recorded, it is then possible to send pedigrees the very day that a pig is sold. This appeals to the buyer as a business-like proposition and therefore cultivates in him a favorable regard for your method of conducting your affairs.

Use of Ensilage Lowers Cost of Gain.

A VERY interesting experiment has recently been concluded at the Iowa station. It involved the feeding of two-year-old steers for a period of 120 days. These steers (Herefords) were purchased in the Omaha market on November 29th of last year at $6.90 per hundred pounds. They weighed approximately 1,000 pounds when put on feed December 5th, and at that time they were divided into five lots.

A different ration was fed each lot—different in amount, though the feedstuffs used were similar in every lot. Lot No. 1 was carried for the four-month period on a full corn ration, this being fed in conjunction with ensilage and oil meal. The steers ate an average of 17.1 pounds of corn daily, two pounds of oil meal and 30.6 pounds of ensilage. On this ration these steers made an average daily gain of 2.98 pounds per head. When marketed they sold for $9.35 per hundred pounds. The steers in this lot had access to shelled corn continuously. In other words, they were fed on the self-feeder plan. The profit on these steers was $24.83 per head.

The steers in Lot 2 were kept on full feed but were fed twice daily. They consumed an average of 17.2 pounds of corn and 28.7 pounds of ensilage daily. In addition they received two pounds of oil meal each daily. They made an average daily gain of 2.93 pounds, and they sold for $9.55 per hundred pounds. The profit on the steers in Lot 2 was $27.02 per head.

In the case of Lot 3 what is known as a 75 per cent grain ration was fed, which means 12.9 pounds of corn daily, 39.9 pounds of ensilage and two pounds of oil meal. On this ration the steers gained an average of 2.80 pounds daily, and when finished they sold for $9.40, or 15 cents per hundredweight lower than the steers full fed twice daily. The profit on the steers in this lot was $26.24 per head.

Coming now to Lot 4, we find that these steers were fed a 50 per cent ration of corn, or an average of 8.6 pounds of corn daily, 51.4 pounds of ensilage and two pounds of oil meal. These steers gained an average of 3.21 pounds daily. They sold for $9.30 per hundred pounds when marketed and the profit on these cattle was $30.89 per steer.

The steers in Lot 5 were fed a 25 per cent ration of shelled corn. They consumed 4.3 pounds or corn, 53.8 pounds of ensilage and two pounds of oil meal daily. They made an average daily gain of 2.56 pounds and they sold for $9.45, or within 10 cents per hundred pounds of the steers fed a full corn ration twice daily. The profit on this lot was $31.97 per head.

Ensilage makes an exceedingly good showing in this experiment. Not only were good daily gains made in every instance, but the cattle were well finished. Old-time feeders will be somewhat amazed to learn that cattle fed only 4.3 pounds of corn daily brought $9.45 per hundred pounds while, on the other hand, steers that consumed 17.1 pounds daily during the entire feeding period only sold for $9.35 per hundred pounds. Substituting roughage in the form of ensilage for grain resulted in this case in cheapening the ration and, in addition, in bringing the cattle to a higher finish during the 120-day period.

Finishing Hogs on Alfalfa Pasture and Corn.

SOME interesting experiments have been conducted at the Nebraska station for the purpose of determining the value of alfalfa pasture as a supplement to corn in fattening hogs. In one instance fourteen shoats weighing 148 pounds were turned onto alfalfa pasture April 25th. They were fed 2.91 pounds of corn daily per head for each hundred pounds of live weight. In fifty-six days they gained an average of seventy-seven pounds each, which is a daily increase in weight of 1.37 pounds per head. These hogs were taken from the pasture June 20th, at which time they weighed 225 pounds. It required 392 pounds of corn to make 100 pounds increase in weight.

A similar lot of hogs were pastured on alfalfa but received only 1.9 pounds of grain daily for each hundred pounds of live weight, whereas the first lot received 2.9 pounds. These pigs weighed an average of 147 pounds on April 25th, at which time they were turned into the alfalfa. They did not reach the 225-pound mark until July 11th, whereas the lot receiving a heavier corn ration tipped the beam at 225 pounds on June 20th. The shoats fed the lighter grain ration gained practically one pound each daily. It required in this case 346 pounds of corn to make 100 pounds of gain. They returned 95 cents for each bushel of corn eaten while the hogs fed the heavier ration returned 84 cents per bushel for the corn eaten.

A third lot of hogs similar to the other two was pastured on alfalfa for eleven weeks, beginning April 25th. They were fed no grain whatever but from the pasture alone made an average daily gain of .52 pounds during the eleven weeks. These hogs, beginning July 11th, were fed a corn ration of 3.1 pounds daily for each hundred pounds of live weight, the theory being that cheap gains could be made by getting a quick finish on hogs that received pasture only for the first eleven weeks. These hogs gained 1.32 pounds per head daily during the five-week period when they were fed grain. It required 407.2 pounds of corn for each hundred pounds of gain. During the short fattening period they required more grain for a given gain than the hogs in the other lots.

Reviewing the three experiments, we find that when hogs were allowed the run of alfalfa pasture and fed 2.91 pounds of corn daily for each hundred pounds of live weight it required a period of eight weeks to increase their weight from 148 to 225 pounds. The second lot that received 1.9 pounds of corn daily for each hundred pounds of live weight required eleven weeks to bring them to the 225-pound mark. On the other hand, it required sixteen weeks to attain this weight when hogs were run on alfalfa pasture alone without grain eleven weeks and fed heavily on corn and pasture during the balance of the period.

As to which method of feeding should be adopted, something depends upon the price of grain as well as upon the abundance of the pasture. Where alfalfa is abundant, cheaper gains can be made by carrying hogs on alfalfa for a time without grain and afterward finishing them quickly, but it requires a longer time to get them ready for market and naturally more extensive use is made of alfalfa and a smaller amount of grain consumed. On the other hand, where there are other hogs coming on so that one shipment goes out and others take their place in the pasture the heavier grain feeding method may be used to advantage.

MORE MODERN FARM HOMES.

Interest by Wisconsin Farmers in Sewage Disposal Indicates Increasing Demand for Modern Equipment, Such as Bathrooms, etc.—Septic and Other Systems Make This Possible on the Farm.

WISCONSIN farmers are becoming more and more interested in the subject of sewage disposal. This important factor in the modern and sanitary home is considered by most farmers who think of building new dwellings. Farmers' institutes and other state meetings have discussed the subject. Letters to The Wisconsin Farmer, to institute workers and to members of the Wisconsin Agricultural College staff, indicate in no uncertain way that sewage disposal on farms is being given careful attention and study.

Pure water and the proper disposal of all sorts of impurities are very important factors making for health and happiness on the farm. Surface drainage has failed to carry away the matter which contaminates water and results in sickness. Drainage from the barnyard and sewage from the house must be disposed of in a manner to make sure that none of it can seep through the porous ground and come in contact with the drinking water. In these days the farmers are equipping their homes with bathtubs, lavatories, sinks, and waste carriers, and some kind of sewage disposal system is necessary, as the farmer does not have the advantages of a community system such as we find in the cities and towns.

The modern and popular way of disposing of sewage is by the septic tank. One of these systems can be built in connection with the average farm home at a very small outlay. If the farmer is able to furnish some of the materials, such as planking, sand, gravel and stone, and supply some of the labor, he may keep the expense down to a minimum. An efficient sewage disposal system consisting of a treatment tank, syphon chamber, and drainage tile for an ordinary farm home with about eight people, can, under favorable conditions, be installed for about $75, according to an estimate of the Wisconsin State Board of Health. It can even be done for $50 under very favorable conditions. The cost of such a residential tank will depend largely upon the character of the soil. If this is sandy or gravelly and well fitted for absorbing sewage wastes, there need be no expense for those materials, but if the farm lacks such soil and it is necessary to haul gravel and sand from a distance, this will add to the total expense.

A septic tank [illegible] localities can be installed to work satisfactorily for an indefinite period and it will render waste harmless. Its use is strongly recommended. Hundreds of farmers in Wisconsin have installed these tanks and provided their homes with modern plumbing and drainage. This tank is outlined in detail in the state plumbing code which can be secured free of cost by writing the Wisconsin State Board of Health at Madison. The state board also assists farmers in planning their sewage disposal plants and construction of wells and the increasing demand for this service by farmers is another indication of the growing demands for modern bathrooms, laundries, etc.

Safe sewage disposal consists in keeping the sewage away from flies and animals and so that it cannot reach the water supply. Cesspools and wells existing side by side are dangerous in any place where people live. Cesspools often overflow; disease-breeding sewage from such pits may easily penetrate the wells from which the family derives its water, and the result is likely to be typhoid fever or other disease. The danger of contamination from an outhouse or leaching cesspool depends almost entirely upon the character of soil and the length of time the utility has been in use.

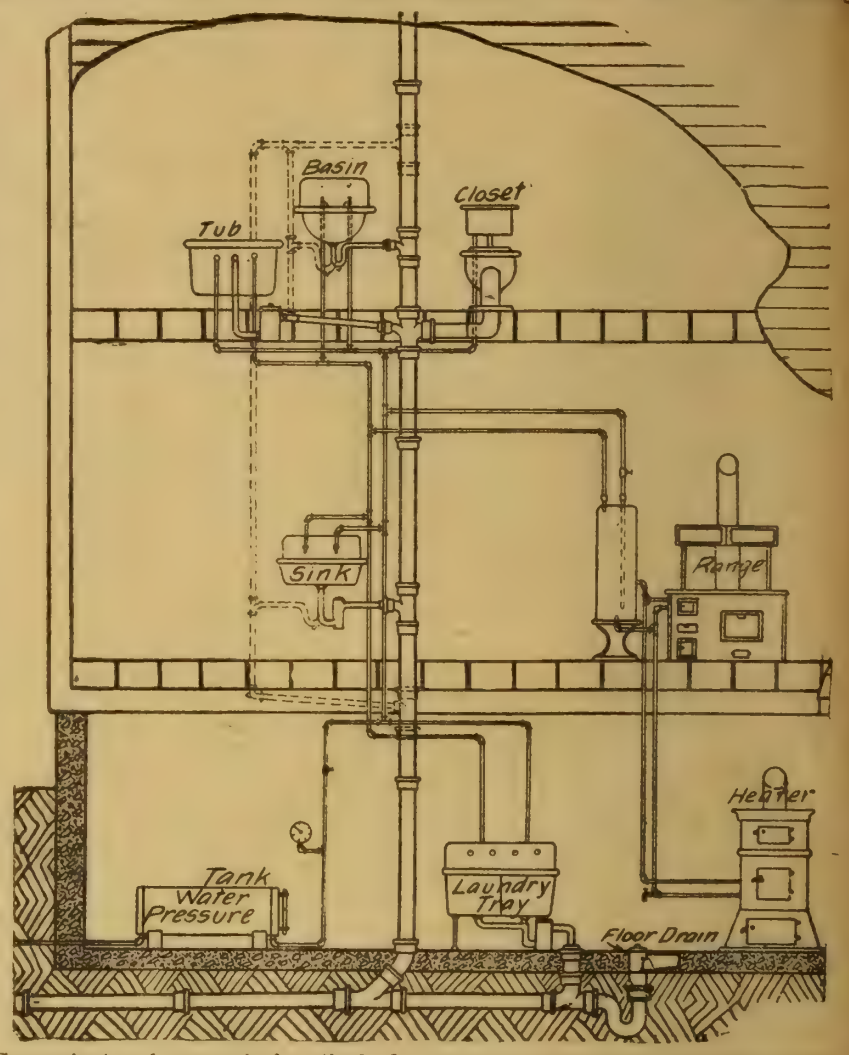
According to the state plumbing code, septic tanks must have one compartment constructed of materials impervious to moisture. The second compartment may consist of a leaching basin, dry well, drain tile, filter beds, or an efficient combination of any of these. The size of the tank should be based on the number of persons using it. It should have a minimum capacity of thirty-two cubic feet, two feet wide, four feet long, by four feet deep, below the level of the outlet pipe, and should allow for a flow of sewage of thirty gallons (four cubic feet) per day, per person, flowing into the tank. Where unusually large volumes of laundry or other clear water are to be emptied into the tank the capacity should be increased in the ratio of one cubic foot of space to every twenty gallons of such surplus water. Surface and rain water leaders and cistern and other overflow pipes should not discharge into a septic or other treatment tank for sewage disposal.

All tanks should be constructed with the longest dimensions parallel to the direction of the flow, which should be at least twice the width, and of a depth of not less than four feet below the outlet. Both the inlet and the outlet should be submerged below the level of the water in the tank. The tank should have at least one manhole and cover. The main sewer where it enters the tank should be provided with standard cast-iron vent, and a similar vent should be provided on the top of the tank or a free circulation of air otherwise provided.

The liquid flowing from a septic tank should be discharged into a leaching basin, drainage tile, filter beds, or a watercourse which is not used as a water supply for domestic purposes, if it does not cause objectionable pollution. Where the effluent is discharged into drain tile or upon filters it is recommended that it first pass into a syphon chamber having an adequate syphon which will discharge the contents of the chamber periodically into the tile or upon the filters. A four-inch syphon is recommended for tanks of ordinary capacity, but a larger one should be provided if necessary. A syphon should be given regular attention. A syphon is not necessary or advisable except when the dry well is to serve as a sprinkling filter or when drain tile is used. All tight cesspool compartments and septic tanks must be cleaned out whenever the sludge contents occupy one-third of the cubic contents of the tank. The leaching compartment must be cleaned out whenever the level of the liquid does not recede below a level of five feet from the bottom and is gradually rising. The sludge from these tanks should be hauled away and buried, or burned in an incinerator when such is available.

The dry well consists of a chamber or well walled up with dry rubble, dry brick work or other material which allows water to percolate through it. The bottom should be left open to the soil. The capacity of this compartment should be such as to provide one square foot of percolating surface (including bottom) to every five to ten gallons of water per day entering the tank. It should be at least ten feet deep by four feet in diameter. The lower limit is to be taken for clayey or compact soil and the upper limit for sand and gravel. This compartment should have a manhole and cover. The sewage from the dwelling should flow first through the water-tight compartment and thence by trapped outlet to the leaching compartment, drainage tile or filter beds.

The use of a dry well or leaching drain (Fig. 1) for disposing of the effluent is not recommended except when there is no possible danger of polluting any private or public water supply or where the use of drain tile or filter beds is impracticable. As



Convenient and economical method of plumbing arrangement in a farm home. All fixtures located near soil pipe that empties into disposal system.

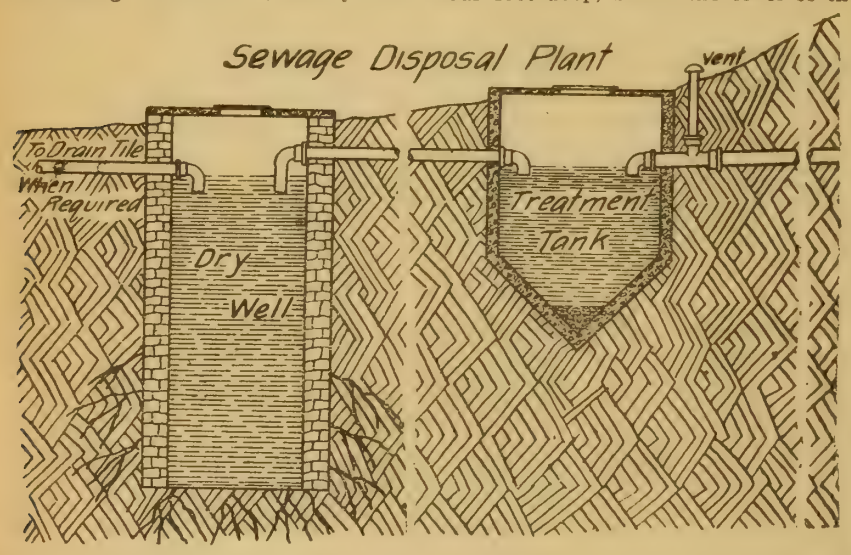


Fig. 1—Sewage by this method may be disposed of by letting it leach from the dry well by connection with drainage tile; filter beds or watercourse.

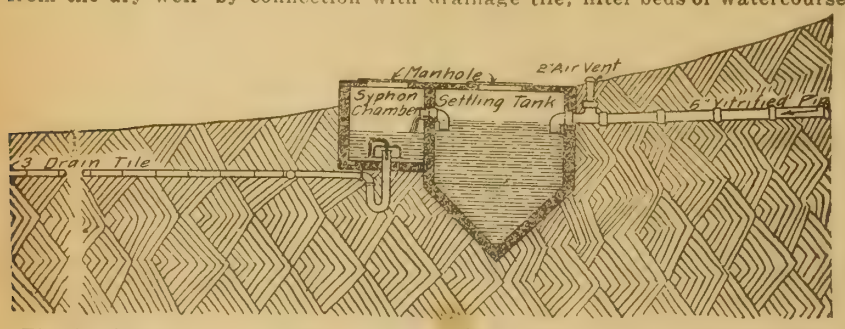

Fig. 2—This method of disposal is favored instead of system shown in Fig. 1 where surface soil for three to six feet is sandy or gravelly.

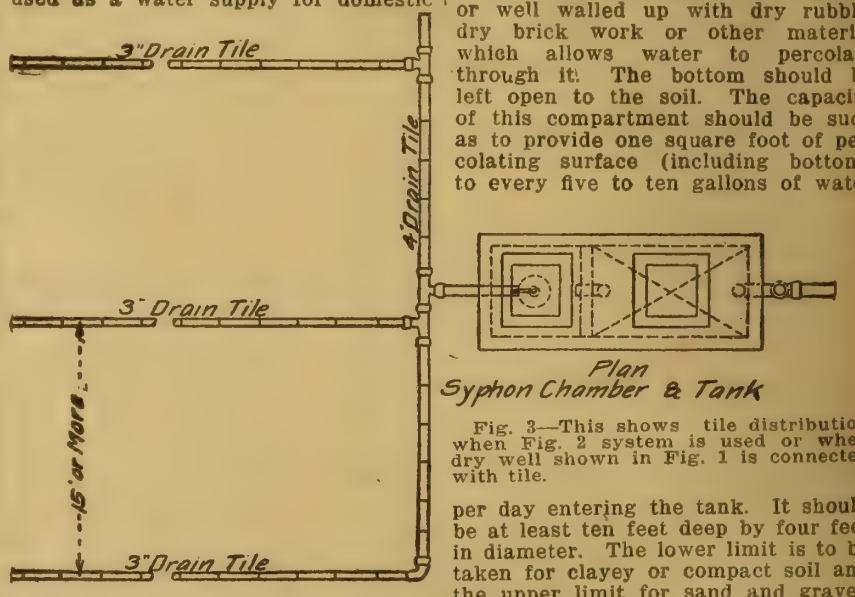

Fig. 3—This shows tile distribution when Fig. 2 system is used or when dry well shown in Fig. 1 is connected with tile.

usually constructed a leaching basin or dry well does not furnish as good facilities for purifying the effluent as filter beds or drain tile laid near the surface of the soil.

A leaching basin or dry well should not be located where there is any danger of contaminating a water supply, well, spring, lake or stream or of causing a nuisance. No water-tight compartment should be located within two feet of any lot line or ten feet from any cistern or twenty feet from any well, spring or other source of water supply used for domestic purposes. They may be permitted within fifty feet of a drilled well where the casing extends 100 feet below the surface of the ground and is driven firmly into rock. No abandoned water supply may be used as a leaching compartment of the disposal system.

The danger of contamination depends almost entirely upon the character of the soil into which the sewage is discharged and upon the length of time the dry well or leaching compartment has been in use since cleaning. A clayey soil full of seams, a porous rock or one full of crevices, or a very coarse gravel will allow the effluent from the leaching basin or dry well to flow directly to the well with little or no purification. A sandy or gravelly soil is the best and safest in which to locate leaching basins, dry wells or drain tile. Where the effluent discharges into a leaching basin located in clayey soil full of seams, a porous rock or one full of crevices, or where there is danger of contaminating the water supply, further protection can be provided by filling the leaching basin with broken brick or rock of similar material, and extending from the bottom of the basin inlet two four-inch vitrified clay pipes with inverted y's at intervals of two feet, and by providing an adequately anchored cone-shaped deflector under the inlet and two feet above the stone contents of the basin, and so designed and installed that it will deposit the discharged effluent in such a manner that it is equally distributed upon the stone or filtering material. The basin must be provided with a six-inch fresh air inlet. A leaching basin thus designed will materially improve the character of the effluent and will afford additional protection.

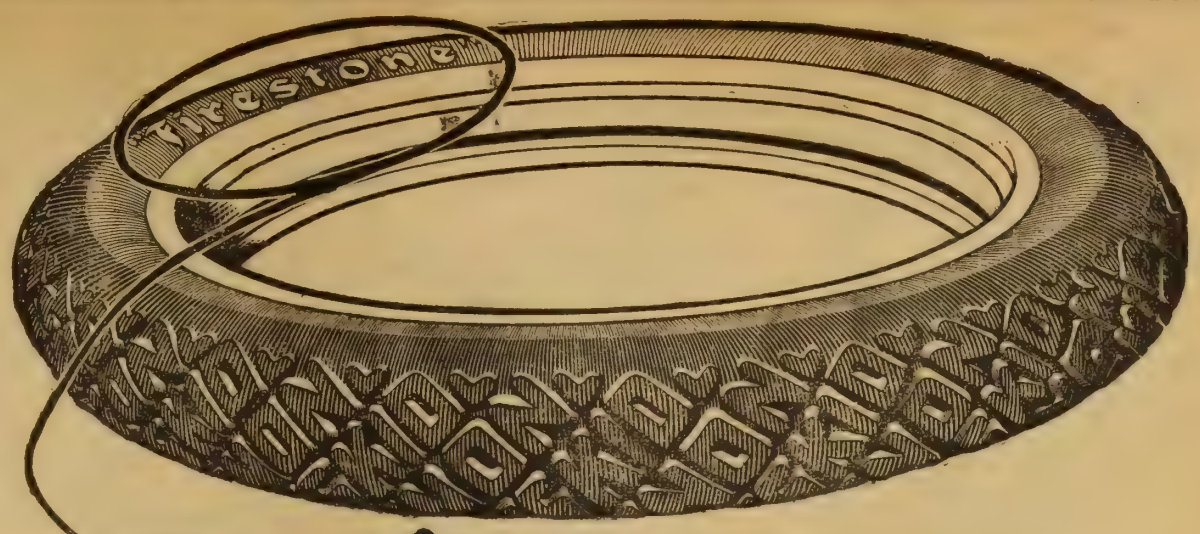
Drainage tile (Fig. 3) should be used in place of a dry well where the surface soil for three to six feet deep is sandy or gravelly. It should be laid twelve inches to three feet below the ground and in a very slight grade away from the tank (about two inches in 100 feet). The tile should be laid in straight or curved parallel lines fifteen feet or more apart. The joints should be left one-fourth inch apart and blinded with burlap or broken tile. The amount of tile laid should be based on twenty to 100 feet per person using the tank, according to the character of the soil. The effluent from the tank should be discharged into the tile by an adequate automatic syphon, located in a chamber adjacent to the tank. The capacity of the syphon chamber below the water line should be equal to the cubic contents of the tile required for the particular installation and must have a water head sufficient to insure proper syphonic action. Each foot of thirty-inch drain tile has a capacity of .367 gallons; four-inch tile, .652 gallons; five-inch tile, 1.02 gallons; six-inch tile, 1.46 gallons. The amount of tile required is governed by the lay of the land and character of the soil. It should be laid about one foot below the surface of the ground, and where it is necessary to lay it deeper than two feet an adequate system of ventilation should be provided.

A water-tight treatment tank, syphon chamber and leaching basin (Fig. 2) should be provided with adequate cement or stone cover or a twenty-inch cast iron ring and cover, and be vented with a four-inch vent pipe extending not less than ten inches above the ground and not less than twenty feet from any window, door or other opening in dwellings.

The sewer from the building must be vented with a two-inch cast iron vent located within two feet of the tight compartment or an adequate free circulation of air otherwise provided. A method recommended for venting is fully illustrated in illustrations 1 and 2.

The outlet from the water-tight compartment should be through a deep invert, the same size as the house sewer, provided with an adequate vent; and the piping between the tight and leaching basin may be either of earthenware or cast iron. The water-tight compartment need not be located adjacent to the leaching compartment; they may be any distance apart, if connected with piping as specified in the code.

The plumbing division of the state board of health will freely assist, without charge, any Wisconsin citizen in making a full investigation of all factors to be considered in determining what system of sewage disposal should be adopted.



Confidence

THE unseen merit in a tire determines its mileage value to you. This is why you must have the confidence that goes with the Firestone name. Confidence in the in-built quality—the hidden values which make Firestone Tires deliver Most Miles per Dollar.

Firestone Tires

Red Side Wall—Black Tread

This color combination (the trade-mark of Firestone Tires) is another reason for your confidence. It shows that all the extra refinements, fine looks as well as service, are yours with Firestone Tires.

Your safety, economy and riding comfort are all safeguarded by this "Word of Honor," Firestone name, which gives you the assurance of personal responsibility.

Free Offer—A Firestone Waterproof Tube Bag free, if you will send us your dealer's name, and the make of your tires. Ask also for book, "Care and Repair of Tires," No. 17.

Why Not Breed Registered Cattle?

To the Editor:—When it is considered that the use of pure-bred sires has raised the standard of merit wherever it has been introduced it seems rather inconsistent that registered stock are not more generally bred and in larger numbers. If all of the registered animals of the Shorthorn breed, this being the strongest bovine breed in point of numbers in America, and admittedly the best adapted to farm conditions in all parts of the country, were placed within a state of average size, there would not be nearly enough animals to stock one-half of the farms within its borders.

That pure blood is potent and works improvement there is none to deny, and in view of this a more general production of registered animals will not only raise the standard of merit but will prove a profitable undertaking. I have often heard this reply from men when appealed to in public auctions of registered cattle, to make an investment. "Oh, I am not a full-blood man," meaning that they regarded it as a business distinct from the production of unregistered cattle. This prevailing impression is unfortunate. Because of it many men have refrained from taking advantage of the larger profits which the breeding of registered cattle offers.

If the average man will make selections of breeding stock, adhering to the type which he holds in favor, he will realize larger profits and an increased interest in the business over the breeding and handling of grade stock. The keeping of records involves but little time and is in no sense complicated. It requires merely making a notation of the birth date of the calves, crediting them to the proper parentage, giving them a name and sending them for record in accordance with the simple rules of the pedigree associations. If the owner does not wish to sell the male calves for breeding purposes they may be sent to the feed lot. Yet, in seven years out of ten they will pay larger profits if sold for breeding purposes. The prevailing practice among experienced breeders is to consign the least promising ones to the feed lot, a plan that works for the improvement of the breed.

There is no longer any doubt as to the superior merit, for practical purposes, of registered stock. Cattle are no longer grown to be subjected to trying conditions of endurance. They are grown to meet the market requirements and the better they are fed and cared for the earlier they are matured, the more certain the profits for the producer. It is under this treatment that the registered animal, the well-bred animal, responds better than the grade carrying a varying percentage of inferior blood. This isn't a theory. It is an established fact that has been so widely demonstrated that there is no longer any question as to its reliability.

If there is a reader of this paper who clings to grade cattle on the assumption that full-blooded cattle are not adapted to his purpose or that there is something professional in their production he will do well to modify his views to conform to the accepted experience of the present day. Comparatively few men will rely wholly upon the patronage of breeders of registered cattle to take their output for breeding purposes, but a large majority will find it profitable to grow registered or full-blood cattle for market purposes. The practice will insure increased profits to any intelligent man who follows it. It required good judgment, intelligent care and liberal feeding, and what successful stockman can proceed on any other basis. The subject merits thoughtful consideration.

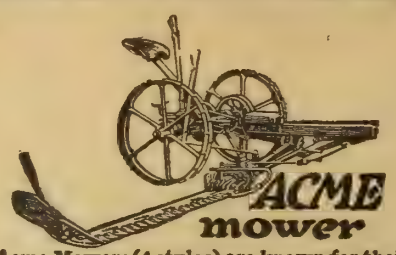
F. D. Tomson.

The French government has granted authority for the shipment of 2,000 carloads of American corn for Switzerland which has been delayed many weeks in Marseilles. The forwarding already has begun.

"ACME machines are all the name means"

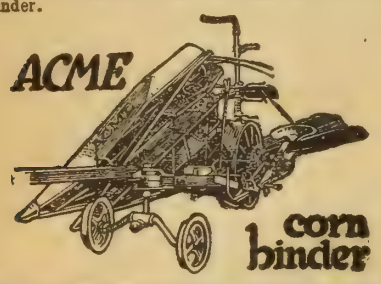
grain binder

The Grain "Binder" that's different — has features of merit that cannot be found elsewhere. It cuts, elevates and binds a maximum amount of grain. It operates easier,—it does the work cheaper. Made in three sizes: 6, 7 and 8-foot cut. Write for FREE CATALOG and read about the "ACME" before deciding upon your next Binder.

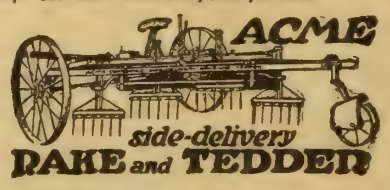


Acme Mowers (4 styles) are known for their power, strength, easy running qualities and conveniently arranged adjustments. There are no unnecessary parts—each "Acme" works perfectly and each user is most enthusiastic over the unusual efficiency. By all means study over the "line." You'll decide to buy an "Acme."

A Self-Dump Sulky Rake that is rendering "real" service. It rakes clean—no other is made as strong and sturdy. The "Acme" is the Sulky Rake you want.



The Corn Binder that cuts evenly every stalk—it works along in a smooth, certain, economical way. Constructed along scientific lines. Binding attachment patterned after the famous Acme Grain Binder—has infallible knotter. It's the standard machine.



Get two machines in one—save the cost of a tedder, it's combined in the "one" outfit. The automatic clutch shifting arrangement is an exclusive feature—and—there are numerous others. It's well worth your time to investigate.

There are five different styles of Acme Sweep Rakes. Each intended to meet certain conditions—and—each giving all 'round satisfaction. Our catalog tells all about them.

This "Stacker" has been giving farmers entire satisfaction over twenty-five years. If you need a stacker you cannot afford to pass up this proposition. FREE CATALOG.

PEORIA, Illinois

NOW IS THE TIME TO "DRESS UP" THE FARM

New walks around the house, a permanent white coating for the silo, a new white spring house, perhaps an ornament or two in the front yard—you can make these and hundreds of other new improvements easily and cheaply if you use

Medusa White Portland Cement

the first true white Portland cement ever made. It is absolutely stainless and is used on farms where *good looks* and *good service* are required. For facings of all sorts—Medusa White will give just the results you want.

You can also cut down expense and troubles by mixing 2% of

Medusa Waterproofing

with Medusa White Portland Cement—or with Medusa Gray—for years the old standby for concrete work on the farm. Prevents cracking and keeps the water out.

We also make Medusa Waterproofed White and Gray Portland Cement—a combination of Medusa Cement and Medusa Waterproofing mixed in the proper proportions during the process of manufacture. Ground together at factory in exact proportions necessary for a *watertight* mixture.

SANDUSKY PORTLAND CEMENT COMPANY

The Farmers' Open Forum

WITH CONTRIBUTIONS FROM READERS OF THE WISCONSIN FARMER

Profited by Studying Farm Management.

To the Editor:—I entered the farm management contest in this county this year to see what the several departments on our farm were really bringing us. I wanted to know what we were making in each department in dollars and cents and to find where improvements could be made in our system. At the end of the year I found that the only reason we could be among the winners; in fact, the main reason why we were making money on the farm was our dairy herd. This proved to us what a dairy herd is capable of doing. There were practically no field crops sold except as they were marketed through the dairy cow. The cream supplies a fancy city trade and the skim milk is used to feed the calves and the remainder given to a few shoats kept for that purpose. Very little income was realized from the sale of surplus stock, as all the heifers, both grade and pure bred were raised, and only the grade bulls and two pure breds, together with a few unprofitable cows, were sold. The farm is composed of 200 acres, forty of which is in timber and not used except to pasture a few sheep. We worked this farm with the help of a married man, who lives in the tenant house, and one single man. During the busiest summer months, or for about two months, there was another single man. We plan to keep from fifty to sixty head of cattle, about half pure bred and half grade, together with forty-five sheep and what hogs are needed to feed up the surplus skim milk. The hogs also get the corn left after filling two silos. We kept twenty-eight Guernsey cows and milk on an average of twenty-three. These twenty-eight cows gave us an average of $110 per head. The farm management contest has taught us that we do not practice diversified farming to a large enough extent. We should have had a larger income from surplus stock and also from field crops. One mistake we made was not using more pedigreed seed. We harvested a large crop of small grain, which should have, after enough was set aside for farm use, been sold for seed instead being sent to the grain elevator for the market price. The same thing is true of our corn crop, but as it did not mature so very well last year the loss was not so great as it would have been in a good corn year.

I am very much pleased with the farm management work and I hope to profit even more next year. I have this last year's experience as a guide and certainly expect to profit by them.

W. A. Lawson.

Fond du Lac Co., Wisconsin.

W. A. LAWSON, FOND DU LAC CO.
One of the Farm Management Contest winners in his county this year.

Farm Management in Fond Du Lac County.

To the Editor:—Our aim at Burn Brae is to breed and develop the best possible Jersey cattle and Duroc hogs, not only for the financial returns, but for the satisfaction derived from owning good stock, and that we like to feel that we are having some small part in promoting the general welfare of our community and state. In the selection of our breeding animals we take into consideration blood lines, performance records and individual merit, and will retain no animal in the herd, no matter how well bred, or how good an individual, that fails to produce creditably; nor will we keep as a breeder a good producer that is decidedly lacking in general conformation. We expect our animals to respond to good feeding and care, and have not in many cases been disappointed.

We believe that the soil is the foundation of the live stock industry, and on our farm have been constantly striving to bring it up to the highest state of fertility and physical condition. We do not consider a soil rich in plant food but lacking in texture, friability and those things which go to make up what we call physical condition, a proper home for plants to grow and develop in. As well expect our cows to produce economically if fed plenty of grain and roughage but deprived of comfortable quarters and a necessary supply of water and fresh air.

Our farm is laid out in four fields of equal size, besides several calf and hog lots, and we practice a four-year rotation of corn, oats, clover and pasture. When we get alfalfa established we expect to change to a three-year rotation of corn, oats and pasture. All crops grown on the farm are fed at home, and in addition we purchased concentrates for over $1,000 the past year. All manure is carefully saved, and applied daily as far as possible, using a manure

RICHMOND LION 75604.

spreader, which we think indispensable. We have had splendid crops of clover, but expect to use some lime and rock phosphate in the future.

Our corn is given the most thorough cultivation possible. Last season the corn was cultivated thirteen times with a two-horse cultivator. The oat ground is prepared, first by plowing twelve inches deep in the fall, using a jointer on the plow, which effectively turns under all trash and helps to mix the soil, then in the spring we work the ground until we have a good seed bed. We like to sow early, but not so early but what the ground works up nice and mellow. We sow our oats at the rate of 1¾ bushels per acre. However, if our land were poorer and not so well prepared we should use more seed. The grass seed is sown at the same time as the oats, using six quarts red clover, two quarts alfalfa and two quarts timothy per acre. The timothy is used mainly for the pasture it furnishes the second year. The hay is cut early and carefully cured, put up in cocks when well wilted, and left to cure three or four days, then opened up to air out. It comes out of the mow in the winter with the leaves on, is nice and green and feels soft. We realize that time could be saved by sun drying the hay, but it would be worth far less, and would be an economic waste.

In buying feed to supplement what is raised on the farm we are governed by the relative price, feeding value, palatability and wholesomeness, and do not see how any of these considerations could well be left out. We cannot understand why so many farmers are afraid to purchase feed in addition to what they grow. They must think there is a very small margin of profit in feeding their own when they are so unwilling to purchase feed grown by others at a 2 or 3 cent per bushel advance over what their own will bring at the elevator. If the profit is small it is nearly always due to unproductive stock. We think a nice profit is realized on all feed we buy, and besides have the manurial value of this feed to enrich our own land, which is a no small item.

Much help and valuable information is received from agricultural and live stock publications of which we take a number, we also make free use of our experiment station when in need of advice as to problems that may arise. Another source of help and inspiration are the various associations to which we belong, and we have never failed to receive much more profit from attendance on association meetings and conventions, as well as visiting successful farms and talking with successful men engaged in our own line of work than such trips have cost us.

Liberal use of advertising space in reliable journals is, we consider, an important factor in our operations, and one which we do not see how we could possibly dispense with. Exhibiting at fairs is also a profitable form of advertising as well as being highly instructive.

In conclusion will say that in our business dealings we endeavor to treat others as we would in like circumstances like to be treated, and sell nothing but what we consider good stock, making good anything that is not right or rectify any error we may make. We wish to say, however, that we have not yet been called upon in any such way.

Fond du Lac Co. C. A. Peterson.

[Winner in County Farm Management Contest.]

Velie Six

Demand Has Trebled Our Output

APRIL trebled our output and recorded our largest volume of sales for any like period —with still greater gains in prospect.

The reasons for this tremendous increase in sales are found in the exceptional quality of the car itself, and in a broadening knowledge of the stability and integrity of the Velie Organization, with a half a century of manufacturing experience and reputation untarnished through all these years.

Read the Velie features. Everything for Convenience, Comfort, Beauty and Economy. Up to the present we have made no raise in prices. The immediate opportunity is yours to purchase at these low figures. Touring car, $1065, with Sedan Top, $1240; Roadster, $1045. Wire wheels on any model, $70 extra. Write for catalog and make your own comparisons.

A Few Velie Features

Six-cylinder Velie-Continental Motor.
Removable Cylinder Head for inspection.
Helical Gears in Motor—no chains.
Enclosed Multiple Dry Disc Clutch.
Hotchkiss Drive—no noisy torque arm.
Spiral Gears in Floating Rear Axle.
Remy Automatic Ignition—Push Button Starter.
Double Bulb Headlights—Dash Light.
All Wires Enclosed in Metal Conduits.
Rear Gasoline Tank—Vacuum Feed.
Simple Rocking Gear Shift Lever.
High Grade Leather Upholstery.
Cushions Deep Tufted—Real Curled Hair.
Long, Flexible Underslung Springs.
Expanding Tire Holder—no Straps.
Mirror Body Finish—20 Operations Deep.
Everything in and on—ready for the road.

VELIE MOTOR VEHICLE COMPANY
118 Velie Place, Moline, Illinois

Answering Those Fencing Questions.

To the Editor:—Through the kindness of one of your subscribers I received a copy of your paper and note that Louis Denis, of Brown county, Wisconsin, wishes to know about fencing. Will say that I have had considerable experience at the business and will try to give him a few pointers that may help him.

In answer to his first question, it all depends on what he is fencing against. Cattle alone will not need as close a fence as will sheep and hogs, but most of the ready-woven fences of standard makes are spaced about right to turn all kinds of stock.

Most of the square mesh fences have the middle line wires and the stay wires of the same size, while the diamond mesh usually use a smaller wire for stays. As to what number they should be, the price he wishes to pay for his fence will determine that. The higher-priced fences of the standard makes are usually heavier than the cheaper fences. The best fence I ever put up was No. 8 top and bottom with No. 10 line and stays, while the most of the fence is made of No. 12 line and stay, which makes a very good fence.

As to which is best, diamond or square mesh fence, both are good if properly put up and either will follow hilly or uneven ground if stretched right.

From past experience I would say the twisted stay is better than the welded. I had some welded and it was so hard that when the snow sagged it and I tried to straighten it up the wires broke at the weld. I had trouble also with the hogs pushing their noses through the meshes and breaking the wires at the weld, but a good, tight twisted stay of No. 10-12 wire will straighten up good after being sagged and will not slip along the line wires. By all means, use the six-inch spaced stays. It will cost a trifle more, but will last a great deal longer and looks better.

As to gates between fields, that would depend on how his farm is plotted. If the gates open from a lane they should be at least sixteen feet in the clear or some careless hired man is going to hook on to the post with the spreader, but if the gates are where all travel is straight through then fourteen feet is long enough. As to the rest of the questions about gates, will say that is merely a matter of choice. I could name a dozen standard makes of gates—all good—but the malleable that is adjustable up and down, made by a well-known gate company, I believe is the best gate on the market. They are made in all heights and lengths, look neat and are as near indestructible as any that are made.

Instead of sawing those posts off after the fence is completed try using a gauge stick and set them all the same height and try to leave half as much space above the top wire as you have between the top and second wire.

About painting those posts around the orchard and barnyard, why not paint them the same color as the barn and trim them on top with the same color as the barn trimming? I have painted some that way and like the effect fine. All colors are alike and they can be repainted when the other paint is renewed with just a little extra paint of the same kind and color.

Now, just a few general hints about fencing: First, above all things, make your corner posts solid. I have tried many ways of bracing, but I find the best way is to use a good heavy post for the corner or end and anchor by mortising a piece of two-by-four two feet from the bottom, like a cross, and set the post so that the two-by-four is under the fence you are building. Then mortise the brace three inches above the ground on the corner post and half way to the top of the second post. Now run a No. 8 wire around the second post near the ground and twist it up tight. Carry it around the end post half way to the top, return to the bottom of the second and wind as before, then twist until it sings. When you splice a wire use the lineman's splice. It is a neater and stronger job than the common Dutchman's splice. It may be a little harder for a beginner, but you will soon forget the other way after you have made a few splices.

When building fence I use a carpenter's apron. I have the staples in the left pocket and a few spikes, for spiking the braces, in the right. Also have a pair of small pliers for splicing in the right pocket. Between the pockets, where the carpenter carries the rule, I keep the large pliers and on the right edge of the apron is a loop for the hammer. After one gets used to returning the tools to their proper places you can work much faster and won't be racing up and down the fence hunting a lost hammer or pliers. When setting or driving posts I lay aside the apron, as it is apt to swing in the way.

In making a stretch on woven wire don't try to stretch too much at once and don't try to stretch over a hill. It is not necessary to put in a brace where you want to stretch in the middle of a line. Just tie the post you are stretching from to the bottom of the next post and tie the top of that one to the bottom of the next. If the ground is very soft put on the third tie, and after the fence has been stretched and fastened to the end post you can remove the ties and use them again.

I hope these suggestions will be of some help and if more definite answers are wanted address me personally and I will send you sketches showing bracing, tying and anchoring.

Brown Co., Minnesota. J. S. C.

Increasing Farm Values.

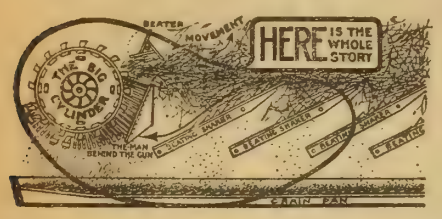
To the Editor:—Intelligent farmers are fast learning that dynamite should have a use on the farm and that the farm equipment is not complete without a few augers, a blasting machine, a case or more of explosives and other blasting supplies. By experience I find this one of the quickest and cheapest ways of increasing farm values. I find when I have a stumpy piece of ground that I can make a good profit by putting it in shape and so I spend a few dollars and get the services of a competent blaster. The blaster who is out for business is supplied with the proper tools, including a blasting machine, and with the aid of another hand or two can blast from fifty to 100 stumps a day. I know of a middle Tennessee farmer who bought a piece of land for speculative purposes. He was offered $7,000 for it and held it at $7,500. An experienced blaster finally persuaded him to have all the stumps cleared, pointing out to him that it would probably be a good investment. He promised to take out the stumps and put them in shape for hauling for 15 cents per stump for the tools and labor. The cost of explosives and other supplies was $37.80. The complete job was $157.80. The farmer then asked his prospective buyer to come around and the farm was sold for $8,000. The original owner made a profit on the blasting cost of $157.70 of $842.20. I know of other places where the work of a good blaster has been just as efficient in raising the price of land and I am firmly convinced that removing stumps by explosives pays. A. H. Harris.

A Green Stack is Poor Bank Collateral

When You Thresh with the

RED RIVER SPECIAL

"there ain't no such thing"



YOU SACK THE GRAIN AND GET THE MONEY

You beat yourself with wasteful threshing. Don't advertise incompetency.

A green stack does this every time, because it shows that your judgment or your methods are wrong.

With Red River Special threshing, the stack can't grow, but your bank account can and will.

The Nichols & Shepard Company issue every year a mighty interesting little paper that many of your own neighbors write for. It is the Home Edition of the Red River Special covering your region. Send for a copy and put in a request for the Big Catalog at the same time. Both are free.

In And Around Wisconsin.

Several of Wisconsin's leading Jersey cattle breeders will attend the annual meeting of the American Jersey Cattle Club, which is to be held in New York, Wednesday, May 3d.

Mr. E. L. Luther, superintendent of farmers' institutes in Wisconsin, is considering holding a big institute at the Wisconsin State Fair. As such a meeting he would call upon the grain institute workers, the potato institute workers, poultry institute workers and live stock institute workers to assist him in arranging a general program of institutional work.

Sayner, Vilas county, has been very successful with social center work. A large number of the Vilas county rural schools have had parents' day or mothers' day and these have been well attended. Sectional teachers' meetings have been fairly well attended. These are of a very informal character—teachers bring specimens of seat work, penmanship, etc., and carry on an exchange of ideas.

Many Wisconsin farmers have adopted the following in their fight against weeds because it gets results: On plowed fields the disk harrow is used frequently before and after planting. One good dragging won't do. It may kill the first crop of pink and green weedlets, but other seeds brought near the surface by the operation will soon sprout. A second disking within a week's time is the best policy. An early start and persistent cultivation means cleaner fields and bigger crops.

Cleanliness in the rural school is a topic of general interest in Wisconsin. Statistics on scrubbing of the schoolhouse have been collected in Door county. It has been found that out of sixty-three country schools in the county included in the survey, one was not scrubbed for an entire year. Five of these schoolhouses were scrubbed once a year. Fifteen were scrubbed twice a year two three times a year, eight four times a year, three five times a year, seven every six weeks, twenty once a month, and two every two weeks.

During the week of the Wisconsin State Fair at Milwaukee, September 11th to 16th, there will be held a camp for boys and girls outside the city of Milwaukee, who will compete in the Boys and Girls' Agricultural Club work. There will be separate camps for boys and girls under the supervision of the Y. M. C. A. and Y. W. C. A. respectively. Meals will be furnished at cost, which will be between 30 and 40 cents each day. For a part of the day the boys and girls will be engaged in work and for the balance of the time they will enjoy athletic sports and visits to the various departments of the fair. Their trips through the exhibits will be in charge of competent guides who will explain the nature and purposes of the exhibits. A physician will be in charge of each camp and proper care will be taken in the selection and preparation of foods. Prof. Thomas L. Bewick, of the Wisconsin College of Agriculture, is in charge of the camps and he will be assisted by many well-known educators of the state. The fair management is planning for 1,000 boys and 200 girls this year.

Wisconsin sheepmen are greatly encouraged over the prospects for sheep raising in this state. Not in thirty years, according to Frank Kleinheinz, shepherd of the experiment station flocks, has the outlook been brighter. He predicts a continuance of good prices for both mutton and wool. "Many ways," he declares, "are open in Wisconsin to make money with sheep if a man uses good judgment and is familiar with the details of the business."

Mr. E. E. Wyatt has been interested in the organization of rural community work in his neighborhood, near Tomah. Mr. Wyatt is secretary of the Wisconsin Jersey Breeders' Association and actively engaged in promoting better live stock.

"New York wrests the banner from Wisconsin." So writes a zealous resident of the Empire State. He claims the dairying supremacy for his state for the reason that forty-seven active cow-testing associations have been formed in New York, whereas in February there were but forty-five in Wisconsin. Since that date, however, three new associations have been formed, which still continues Wisconsin in the lead.

According to Ex-Governor W. D. Hoard, the first pure-bred Holstein sire was taken into Jefferson county in 1875, and ten years later the first pure-bred Guernsey sire was introduced in this now great dairy county. Today the revenues of the farmers of

ROBERT SMILEY, ALBANY, WIS.
Recently chosen president Wisconsin Poland China Breeders' Association.

Jefferson county from the sale of pure-bred and grade Guernsey and Holstein cattle amounts, according to Mr. Hoard, to very large sums every year. This goes to show what constant agitation will do for the enrichment and development of a section.

The annual report of the Wood County Cow-Testing Association places the herd of Holsteins owned by E. E. Butters, of Marshfield, at the head of the averages, and that of W. A. Schulz, of Auburndale, second. Four cows of each herd completed a full year's work averaging 14,180 pounds of milk and 472 pounds of butter fat, and 11,378 pounds of milk and 422 pounds of butter fat, respectively. J. C. Keiffer & Son owned the cow which carried off individual honors. She made, in the year while under test, 17,910 pounds of milk and 566 pounds of butter fat.

Cow racing is becoming a popular pastime in many sections of the state. While this diversion may lack some of the excitement furnished by horse racing, those who are in it claim that it makes up for this deficiency by yielding snug profits. There are forty-eight cow-testing associations in the state at this time. This means that a thousand or more farmers are finding which are the loafers in their herds and getting rid of these unprofitable cows. The work is under the general supervision of H. C. Searles and Paul Burchard, of the Wisconsin Dairymen's Association, and N. E. Negley, of the United States Department of Agriculture and the College of Agriculture.

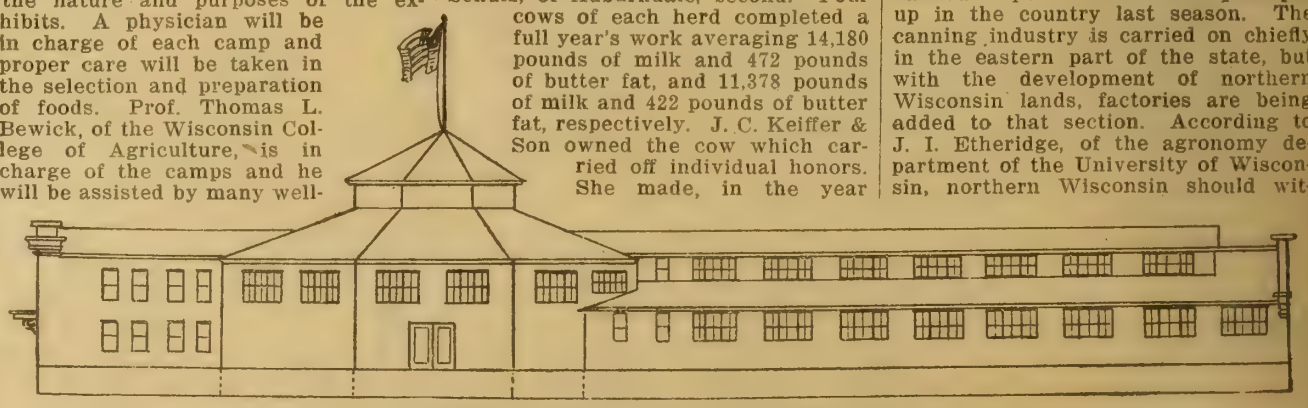
Several agricultural contests have been planned for boys and girls in Walworth county. These include a corn contest for boys from twelve to eighteen years of age, a potato contest for boys of the same age living in the city who cannot raise corn. There will also be a tomato contest for girls twelve to eighteen years of age. About $300 is offered in prizes. Mr. L. L. Oldham, the county agent, has the contest in charge.

Reports from Washington county indicate a splendid demand for pure-bred cattle, with the supply not equal to the demand. A number of sales have been made recently by persons in the vicinity of Hartford to those who are building up herds in other states. Mr. Lawrence S. Murphy, of Badger Stock Farms, has made two shipments recently to Oklahoma and one to Zion City, Illinois. He also reports a deal on for a carload of good stock for Windom, Minnesota.

A teacher of agriculture in a Clark county high school spends his forenoons in the class room, and his afternoons and evenings in testing fourteen dairy herds in his section. He spends one night with each patron of the association, taking milk samples night and morning, and making out feed records. He also has a farmers' club and a boys' and girls' club, and in other ways is a booster for Clark county's agricultural interests. Needless to say he is hired for twelve months a year.

Inspection of cranberry vines is the latest avenue of work which will be undertaken under the direction of the state entomologist, J. G. Sanders. Under his power given by the Wisconsin State Board of Agriculture the state entomologist will require inspection of vines offered for sale for propagation, and vines which are to be moved to a new location to start cranberry beds. These will be included in the regulations of nursery stock shipments. The state law forbids shipments by railroad or express companies of nursery stock, including small fruits, unless the same bear the official state inspection tag. Wood county is the state cranberry center. In 1915 there were 7,117 acres in cranberries in Wisconsin.

The value of peas canned in Wisconsin last year reached large sums. The seventy factories of the state canned 37 per cent of all the peas put up in the country last season. The canning industry is carried on chiefly in the eastern part of the state, but with the development of northern Wisconsin lands, factories are being added to that section. According to J. I. Etheridge, of the agronomy department of the University of Wisconsin, northern Wisconsin should witness a rapid growth in the pea-canning industry. The climate is good, seasons are long enough to grow any late variety and the soil is ready to be mellowed with this crop. A recent meeting of Wisconsin Pea Canners resulted in the organization of a corporation to advertise Wisconsin peas. The activities of the organization will undoubtedly help to keep Wisconsin the foremost state in the production of peas.



WAUKESHA COUNTY SALES AND SHOW PAVILION.
Erected by live stock breeders of Waukesha county, Wis. Part of this barn will be occupied for the big Holstein and Guernsey sales early in June this year.

Condition of Crops and Live Stock

THIS department is making its appearance this week in response to urgent requests made by Wisconsin Farmer subscribers. It is the result of a careful survey made by men who make observations and who report accurately the result of their findings. It will appear each week until the crop season is closed and it is the purpose to have every part of the state of Wisconsin represented from time to time. If any of our readers have a desire to join our crop reporting staff we will be pleased, indeed, to furnish suitable blanks and stationery. The Wisconsin Farmer is not competing with crop and weather bureaus of state or federal government and it will not hesitate to use data from these sources when it concerns Wisconsin Farmer readers. By having our own staff, however, we are placed in the position of reducing the problem of crop and live stock reporting almost to a science.

Burnett County—Spring work is delayed on account of heavy rains and snows. Early thunderstorms in April were very severe; cold winds came from the north and northwest. Meadows are still under water. Winter wheat appears in good condition on both high and low ground. Pastures will be fine, unless frost comes. Cattle are in fairly good condition, after the severe winter, but many cows are abortive, some herds having 50 per cent. Hogs are in prime condition.—E. H. Johnson.

Clark County—Cold, rainy weather has delayed work very much. Some plowing has been done and seeding has started on high, sandy lands, grass is starting slowly because of cold weather. Both the old and new seedings of clover have been badly damaged by the ice which covered the ground nearly all winter. Fall seeded grains were also damaged by ice. Many fruit trees were broken down by ice clinging to their branches. Young pigs and calves are doing well. Horses have been troubled with distemper and heaves.—Louis Buddenhagen.

Douglas County—Late rains have delayed sowing of small grains. Meadows and pastures are starting out fine. Hay is scarce and selling for $12 a ton in the country. Dairymen are having good luck with their calves.—J. N. Ottun.

Dunn County—Unfavorable weather conditions retarded spring seeding some, but it is now under full swing. Winter grains and grasses came through in fine condition. Fruit trees and berry bushes have suffered little; strawberries are unusually promising. Losses of spring pigs are unusually heavy.—J. D. Millar.

Fond du Lac County—Spring is backward, being very cold and wet. Very little seeding has been done, and will not likely begin before May 1st. Corn planting will be late. Rye is in good condition, but fall wheat is badly damaged. Old seeding of clover winterkilled badly, but new seeding has a fair stand. The losses in young pigs have been considerable.—A. L. Williams.

Iron County—Weather is cold and very rainy. No spring work, whatever, has been done. A considerable increase in the amount of potatoes planted is expected. Calves seem to be doing fine. The dairy industry is developing rapidly in this region.—J. A. Becker.

Jackson County—Both the old and new seedings of clover are almost a total loss; a little clover is left on the low spots. Alfalfa stood the winter better. Rye and winter wheat winterkilled considerably. The cold, wet weather has delayed work; little seeding has been done. The seed corn situation is improving; dealers are well supplied with Minnesota grown 1914 corn of good germination. Pastures will come along with a rush when the weather warms up.—P. W. Jones.

Lafayette County—Weather is cool and wet. Grass is coming up very slowly. Hay is not plentiful and the quality is poor. Farmers are buying feed. High-testing seed corn is scarce. Clover and alfalfa winterkilled badly. Horses are plentiful and cheap. Hogs are scarce, not so many brood sows, but early pigs are doing fine. Cheese factories are contracting milk at $1.35 and $1.40 per cwt.—W. J. Martin.

Langlade County—Too much rain has delayed seeding. Winter wheat and rye are looking good; so, also, are the meadows and pastures. Calves are doing well, but the losses on young pigs are heavy.—Charles Parsons.

Marquette County—Weather is cool and rainy. The percentage of spring pigs is normal, and they are doing well. Nearly everyone has had good luck with their colts and calves.—Emil Hein.

Oneida County—About one-fourth the small grains are planted. The land is not dried out enough in most places to work, because of a week of continuous wet weather. Clover seeding is exceptionally good; very few cases of freezing out. A few acres of early potatoes have been planted. Spring pigs are scarce, because brood sows were killed last fall on account of corn failure. Percentage of pigs being saved is about normal. Calves and colts are doing fine, but colts are fewer, although more mares were bred in 1915 than ever before. Many complain that mares are not breeding.—Clyde Burkhart.

Outagamie County—The loss of winter wheat is about 50 per cent, but rye looks fairly good. Meadows and young clover were badly damaged by sleet, ice and late winds. Cold, wet weather has caused the pig crop to be about 50 per cent below normal. White scours caused a loss of about 10 per cent of the calves.—Harry Lepplu.

Pierce County—Weather is very cold and wet. Only a small amount of seeding has been done. Many farmers are plowing and cultivating, and have not started sowing. Early sown rye looks good, but the late sowing is a failure and will have to be reseeded. Some clover winterkilled. There is very little feed in the pastures. Cattle, as a rule, are looking good. Calves and pigs seem to be doing nicely. One of the best maple sugar seasons on record has just closed, but demand is still unsatisfied at $1.50 a gallon.—G. K. Moore.

Price County—Season is late. Seeding has scarcely begun. Winter grains and upland meadows came through the winter safely and are in prime condition. Pastures look good. No damage to fruit trees is noticeable. Live stock are doing well.—C. F. Glissendorf.

Richland County—Spring is cold and backward, with occasional frosts. Seeding is nearly finished, but some barley is yet to be sown. Recent rains have delayed seeding. Pastures are turning green slowly. Farmers are still feeding hay, which is getting scarce. Winter wheat is almost a failure, and some are reseeding to barley and oats. A few early potatoes are planted, and strawberries are being set out. Pig crop is better than last year. Some dairymen are losing their calves.—E. C. Stewart.

Rusk County—Farmers are preparing ground for small grain. Winter wheat and rye look good and were not injured to any extent by freezing. Grass is starting and cattle will be out on pasture about May 1st. Meadows are in good condition. Dairy cattle are in fine condition after having gone through an extremely cold winter. Most farmers are having success with their calves this spring.—T. M. Thomas.

Sawyer County—Cold and excessively rainy weather has held back the usual spring work. Many fields and low places are completely flooded; swamps and lakes are overflowing. On light, well-drained soil, plowing and disking for grain has commenced, but no seeding. Hay meadows and clover fields, especially the well-drained areas are looking fine, and the new seeding is coming in good shape. Cold, wet weather is causing trouble with the lambs.—Jens Uhrenholdt.

St. Croix County—Spring is cool, wet and late. A little seeding has been done, also some plowing. The acreage of rye is not as large as last year's, but conditions are favorable and the growing grain looks fine. Meadows promise abundant hay and pasture. Farmers have fewer brood sows than usual, and the cold, wet weather is hard on little pigs. The percentage of pigs saved is below normal. Cows and calves are doing nicely.—Stephen Everson.

Taylor County—Spring is late with lots of rain. Not much seeding has been done, but it will start in about a week. All planting will be late. Farmers intend to sow a large acreage of small grain this season. Stock wintered over well, and plenty of feed is left. Spring pigs are not very plentiful and sell from $3 to $4 a pair. Young calves are doing nicely. Most cheese factories started April 1st.—E. H. Dehne.

Washburn County—Winter grain and clover came through winter in excellent condition. Pastures and meadows are starting. Recent heavy rains have delayed farm work; heavy soils are too wet to work, but some plowing and seeding has been done on lighter soils. Live stock wintered well and are healthy. Milk cows are in good demand and selling high, but demand for horses is slack. Numbers of young colts, calves and spring pigs are about normal. Seed oats are selling at 60 to 80 cents; corn, $6 to $8; hay, about $15.—L. D. Garnhart.

Quineilo Farm's Holstein Sale.

Quite a successful Holstein dispersion sale was held at Thiensville, Wis., April 18th, at the Quineilo farm. This sale was held under the auspices of the E. M. Hastings Co., of Madison. It was an exceptionally good bunch of cattle some of the cows having a record of 874 pounds of butter in a year. The entire allotment had been tuberculin tested and a sixty-day guarantee accompanied the sale of each animal. Some idea of the range of prices may be gotten from the following enumeration of the principal sales:

BULLS.

Sir Johanna De Kol 19th, Jan. 5, 1909; T. C. McMillan, Wilwaukee, Wis. ..... $ 925
Quineilo Canary Paul Lad, June 8, 1914; Nutricia Farms, Thiensville, Wis. 150
Quineilo Johanna Korndyke Lad, July 28, 1915; R. C. Stolpher, Random Lake, Wis. 105
Quineilo Johanna Hengerveld Lad, May 14, 1914; F. C. Bulgrim, So. Germantown, Wis. 90
Quineilo Johanna Pontiac Lad, Dec. 28, 1914; Felix Armbruster, Cedarburg, Wis. 100
Quineilo Sir Johanna Fobes, Nov. 25, 1914; J. Ullman, Dousman, Wis. 85

FEMALES.

Daisy Rose 2d, May 25, 1907; H. W. Halbach, Waterford, Wis. 375
Quineilo Daisy Rose De Kol, June 13, 1912; Mr. Stimson, Holywood, Wash. 450
Quineilo Rosebud Hengerveld, May 31, 1913; Mr. Stimson 400
Quineilo Small Hopes Johanna, Nov. 25, 1911; H. W. Halbach 350
Quineilo Ester Hopes Johanna, April 7, 1915; T. C. McMillan ... 245
Quineilo Pietertje De Kol, Dec. 1, 1911; Mr. Stimson 600

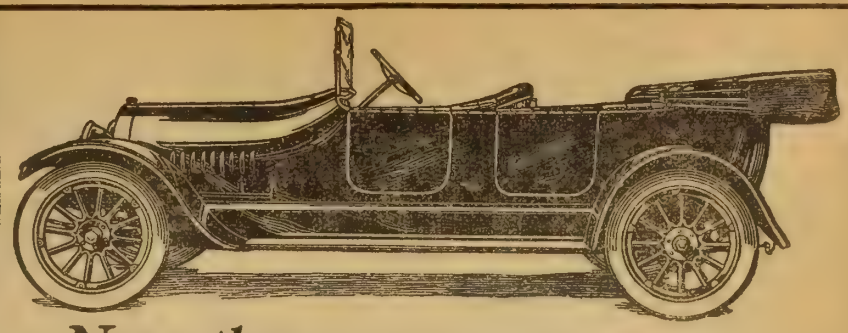
Likes Loose-Bottom Coops.

To the Editor:—Lice is one of the biggest knocks to the poultry raisers I know of. Keep all coops clean, not part of the time but all the time. We like the loose bottom coops the best, as they are easily cleaned. Just tip the coop over and there you are. You can clean them much easier and leave them exposed to the sun several hours. That helps to purify and keep them dry. We use roofing paper for the roof. It lasts several summers if cared for, so is not as expensive as a cheaper roof that has to be renewed each season. — F. & A. Fay.

Independence, Iowa.

It is being proved that returned Australian soldiers, no matter how "citified" they were before they went to the front, prefer employment out of doors in roomy places in preference to the walls of offices or business places. It is being discovered that there are extensive possibilities in the matter of providing at small cost opportunities for soldiers to become occupiers of agricultural holdings near the market offered by the larger cities and holding out possibilities of good returns for steady, intelligent work. A promising beginning has been made with a scheme for making available for returned soldiers farmlets of about five acres each, suitable for growing supplies of Sydney's needs, only partly satisfied at present, as regards poultry, eggs, fresh vegetables and fruit. A start has been made with the getting ready of an installment of thirty-seven of such farmlets handy to Sydney. It is proposed to place these farmlets, ready for occupation and cultivation, at the disposal of returned heroes at a rental of about $10 a year.

A total of 1,600 carloads of celery were shipped from the celery growing regions in the Sacramento and San Joaquin deltas last summer, according to reports received by railroad officials of California.



Now the

Crow Elk-hart "30"

at $725.00

Here is the most startling motor car value of the year. A big, light-weight, roomy, 5 passenger, 34.9 horse power touring car (112 inch wheel base) at $725.00, backed by **eight-years-proved chassis construction.**

The Year's Big Motor Car Value

Never before has such a big, powerful car of proved merit been offered at this astoundingly low price. The Crow Elk-hart "30" has many exclusive features, such as: motor with detachable head; piston port holes for oil conservation and prevention of smoking, equal distribution of weight, giving riding comfort and roadability. Body has superb grace and finish, with no body squeaks.

You will want a Crow Elk-hart "30." See the beauty, roominess and power of this sturdy car today and place your order at once.

FEATURES
Wheel base—112 inches.
Motor—34.9 h. p., 4 Cyl. en bloc.
Electric Equipment—Dyneto 6-volt system, starting and lighting; Willard storage battery.
Clutch—Multiple disc, 7 plate Raybestos lined-in oil spray.
Tread—56 inches.
Rear Axle—FULL floating type.
Body—Full streamline, 5 passenger, beautifully upholstered—instruments on cowl.
Weight—1970 lbs.
Price—$725.00 f. o. b. Elkhart, Ind., fully equipped.

FILLING THE FOOD BASKET.

Population Growth Will Bring No Hunger, Says Investigator.

Many men are inclined to sound a pessimistic note as to the adequacy of the world's food supply for future generations, and, like Malthus a hundred years ago, are inclined to predict that the day has at last come when the human race must cease to expand its numbers or else face inevitable hunger, says the National Geographic Magazine.

And when we consider how many mouths there are in this world to feed and how much food it takes to satisfy them, little room is there to wonder at this pessimism.

The earth's population today reaches a grand total of about 1,700,000,000 souls. If they were all set down at a banquet it would require sixteen tables reaching around the globe to seat them. For every ounce of food they ate the host would have to provide 53,000 tons of provisions, and if the dinner were no more than a dollar-a-plate affair it would cost, in the aggregate, as much as it costs to run the United States government a year and a half. Expressed in terms of annual consumption, the world's market basket is one that defies portrayal in weight and size. One is forced to cast around for new units of measurement to give a proper idea of its proportions. Assuming that the average inhabitant of the earth uses two pounds of provisions a day, the total for the year would amount to 1,250,000,000 tons. It would require a string of cars, carrying thirty tons to the car and reaching eight times around the earth, to haul this material.

The fact, however, is that the average inhabitant of the earth probably uses more than two pounds of provisions a day. The steerage passengers on English ships are allowed two and a half pounds each day. Even the prisoner in the average jail gets more than two pounds, the Russian conscript four pounds and the Austrian common soldier two and a half pounds a day.

Still another way to get an idea of the size of the world's food problem is to assume that the average individual consumes 10 cents' worth of food daily. On this basis it would require the entire national wealth of the United States, the richest nation of all history, to pay the world's food bill for twenty-six months. For every cent per day per capita that the cost of living increased more than $6,000,000,000 is added to the world's annual market basket expense.

But when one considers the possibilities of future food production it is difficult to have much faith in the prophecies of pessimism of these twentieth century successors of Malthus. For instance, in the United States we have 935,000,000 acres of arable land, only 400,000,000 of which are under cultivation. Yet, with less than half of our available land utilized, the United States produces one-sixth of the world's wheat, seven-ninths of its corn, one-fourth of its oats, one-eighth of its cattle, one-third of its hogs and one-twelfth of its sheep.

Even with the land now under cultivation, if we produced as much wheat per acre as England and Germany, we could supply the world with two-thirds of its flour. If we produced as much corn to the acre as they do we could double the world's supply of that product.

Today the United States has a total cereal crop of 5,000,000,000 bushels. Were all of our arable land under cultivation and producing only according to our present standard, which is less than half as high as that of western Europe, we could add enough cereals to take care of an additional population the size of that of Europe.

When one has lived on land which, at the end of the civil war did not produce more than eight bushels of wheat and twenty bushels of corn to the acre and has seen this land produce as high as forty-five bushels of wheat and 100 bushels of corn, it is difficult to take any other than an optimistic view of the possibilities of American agriculture.

Not only are there infinite possibilities yet untouched in our own country, but also in most of the other countries of the earth as well. For instance, Russia, that land for which nature has done so much, endowing it with food-producing possibilities such as few other countries possess, has a wheat yield of only ten bushels to the acre.

When the day comes, as come it certainly will, that Russia produces as much per acre as Germany and England, and when the untold millions of acres of undeveloped land are opened up and settled, as they are destined to be, it alone can supply the world's present needs in cereals except rice and corn.

LATE SOWING CROPS AT REDUCED PRICES

The seed situation, which has been really alarming, is growing daily more and more serious. The Galloway Brothers & Co. Royal Purple Grand Champion Pure Tested Seeds have proved a boon to the farmers of this and other sections of our country. Orders have been pouring in by the thousands, yet we still have a supply of all seeds on hand, taken from both the 1914 and 1915 yields. These seeds will give from 95% to 98% germination test. Our alfalfa, Sudan Grass, Feterita, Sweet Clover and other legumes cannot be excelled for price or purity. Inoculated with "NITROGEN" the roots take hold of the ground firmly and cling to the soil with the tenacity of the thistle. Try a small plot of these seeds this year. It is not yet too late. Below we give you a list of crops that can yet be planted this year.

Galloway Bros. & Company Royal Purple Grand Champion PURE TESTED SEEDS

EARLY YELLOW SOY BEANS

The Only Variety Suited to the Climatic Conditions of the North and Middle West.

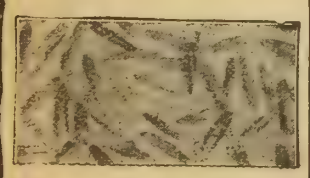
SOY BEANS are in great demand for sowing with corn as a supplement. The advantage of such a combination lies in the fact that SOY BEANS are great nitrogen gatherers, and hence are richer in nitrogenous compounds than corn silage alone. Mixed corn and SOY BEAN silage is a much more evenly balanced feed than corn silage alone. One half-bushel of SOY BEANS will sow down one acre when sown alone, in drills two and one-half feet between rows.

Price by express or freight: 1-2 bushel, $1.50; 1 bushel, $2; 5 bushel lots, per bushel, $2.95.

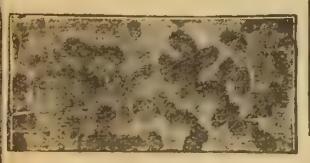
FETERITA

A very prolific yielder. Extra early. A great drought resister. Twenty days earlier than Kafir. A fine forage crop. Will produce from 60 to 100 bushels of grain per acre on any good average land. Grain makes excellent feed for hogs and chickens. Use 6 pounds of seed per acre in drills 40 inches apart in the rows. Use 10 to 15 pounds per acre when sowing broadcast.

Postpaid, per pound, 12c; 5 lbs. 55c; by express or freight, 20 lbs., $1.00; 50 lbs., $2.00; 100 lbs., $3.50.



Pure Tested Perennial Rye Grass Seed.



Pure Tested Alfalfa Seed.

SUDAN GRASS

The greatest hay and forage crop ever introduced into the United States. Will grow on rich or poor land, dry or damp land. Whether it is for beef or milk, for work or driving animals, you'll find no feed equal to SUDAN GRASS. Stock find it particularly palatable, preferring it to other forage. It exceeds timothy in nutritive value, is more satisfactory than sorghum or millet; is easily cured and handled, making the finest hay and splendid ensilage. In the short time since its introduction into this country by the Department of Agriculture, its wonderful properties have placed it at the head of all forage crops. "There is no better grass in the world for conditioning work animals or milk production than SUDAN." It produces feed in abundance wherever grown, with or without rain. It is a marvelous drouth resistant. Thrives in spite of excessive moisture. Five pounds of seed will plant an acre, drilled. That amount will return 500 to 800 pounds of seed and two tons of hay the first cutting, grows again immediately from the stubble; good for two or three more cuttings each season, one to two tons per acre each cutting. Can be sown broadcast, using 10 to 15 pounds of seed per acre.

Price: Per lb., postpaid, 25c; 5 lbs., sufficient for one acre, $1.15. Price by express or freight: 20 lbs. $3.20, 50 lbs. $7.00, 100 lbs. $14.

ALFALFA

Northern Grown, Non-Irrigated Seed, 99% pure

This splendid strain of ALFALFA is especially suited to Northern latitudes and high, exposed places. It is perfectly hardy and can be depended upon to withstand soil and climatic conditions that would be fatal to most other less robust types of ALFALFA. Get your order in early for some of this exceptionally choice seed.

20 lbs., $4.90
60 lbs., $13.10
100 lbs., $23.50

JAPANESE MILLET

(Billion Dollar Grass)

This is a type of MILLET absolutely distinct from all others. It is sometimes calleed BILLION DOLLAR GRASS. It grows from 6 to 9 feet high; stands up well and yields enormous crops. When cured it makes excellent hay, which is considered superior to corn fodder in quality and is eaten readily by all kinds of stock.

It is usually sown broadcast at the rate of 15 pounds per acre, but yields better if sown in drills 12 to 18 inches apart, using about 12 pounds of seed per acre. Cultivate until about 18 inches high; after which its growth will smother out all weeds. This variety does best on low, moist ground. We have a very choice stock of this seed and would strongly recommend our farmer friends to sow a few acres of this valuable fodder this spring.

Price (by freight or express).
20 lbs., $1.20
50 lbs., $2.95
100 lbs., $5.90

MANGEL WURZELS

Galloway's Famous Imported

MANGEL WURZELS are an indispensable part of the winter ration for dairy stock. Go to the great Dairy Shows during the Fall of the year and ask the herdsmen what they feed their Prize Stock, and in every case you will get the same answer; MANGELS! There is a reason! During the winter months when the dairy cows are unable to pasture, they need something to keep them in condition, something that will insure a continuous flow of good rich milk and a high percentage of cream. MANGEL WURZELS insure this. Remember, too, that they yield two or three times as much as Turnips and Ruta Bagas and can be grown just as easily. On our own farm we have had yields of 40 to 50 tons of MANGELS per acre. Sow 6 to 8 pounds of seed per acre in rows 2 feet apart. Any good soil will grow MANGEL WURZELS.

	1 lb. postpaid	5 lbs (Sufficient for 1 acre--express)

Goldon Tankard	.45	2.40
Goldfinder Yellow Globe	.45	2.40
Giant Half-Long Sugar	.45	2.40

MILLET

Genuine Southern German or Golden

This grows very rank and is one of the best varieties for hay or fodder. On good, rich soil it will make a growth of 4 to 5 feet high, and although the hay may seem coarse, it is so tender that, if cut at the right stage, which is when in full bloom, even the hogs will eat the cured hay quite greedily. A yield of 5 tons of hay per acre is nothing unusual.

Price by express or freight: 20 lbs., 90c, 50 lbs., $1.90; 100 lbs., $3.80.

WHITE BLOSSOM SWEET CLOVER

The Great Soil Builder

For restoring worn out soil, nothing equals this clover. It seems to grow in all climates and with little regard to the character of the soil. It is found growing in gravel pits, heavy clay soils and sometimes in almost pure sand. Nor is it particular as to moisture. It stands more dry weather than alfalfa, yet is often found growing in low, wet soils. It sends its roots to a great depth. It is a legume like Red Clover and Cow Peas and like these plants has the faculty of extracting nitrogen from the air and storing it up in the roots, thus fertilizing the soil for the use of succeeding crops. It is a valuable forage crop. Stock like it and thrive on it. In food value it does not differ from alfalfa. The crop may be pastured closely and there is little danger of bloating. For hay it should be cut just as it is coming into bloom, and is handled in much the same way as alfalfa. A second cutting can usually be secured from 40 to 60 days later, if not pastured. It is also used to some extent as an ensilage crop, put into the silo and fed successfully in this way. Sow 20 to 25 pounds per acre.

FARM MECHANICS

Auto, Farm Engine and Farm Machinery Ailments diagnosed and remedies suggested in this department

QUESTIONS AND ANSWERS.

A Dead Magneto.

I have a Tritt magneto that will not generate any current. The magneto seems to be in fairly good condition and I can find n thing wrong. The magneto has not been used for several years. Your advice will be apreciated.

Answer.—Turn the armature over by hand. If the armature has a good "kick" the magnets are all right. If the armature does not turn harder in one position than in another the magnets need to be charged. Examine the magneto for broken brushes. See that the breaker box and distributor are free from rust, dirt and gum. See that the contact points are in good condition and that they open and close correctly. If you cannot locate any trouble you better send the magneto to the maker for repairs.

Set Screw Trouble.

I have a ten-horse-power engine mounted on a truck. It is hopper cooled. There are three large set screws on each side of the hopper cooler which hold the hopper tight on the engine. These screws are somewhat loose, and the hopper shakes when the engine is running. I tried to tighten these screws, but I could not turn them either way. I twisted one off. Is there any way I can tighten these screws so that the hopper will not shake?

Answer.—You might make some wedge-shaped shims and drive under the points of the screws. Often a stuck set screw may be loosened by giving it a few sharp blows on the head with a hammer. To remove the broken set screw drill a hole into the screw slightly smaller than the bottom of the thread. Drive a square, tapered, hardened plug tight into the hole and turn the plug by a monkey wrench.

Spark Out of Time.

I have a 1911 Ford car. The timer wore out and I got a new one that is exactly like the old one so far as I can see, but when I put it on and try to crank the car, it fires back through the carburetor. I have tried advancing and retarding the spark, but it still has that sputtering through the carburetor. The wiring is put on just as it was on the old one and is in good condition. I cannot find anything wrong with the connections or coil.

Answer.—Your spark is not occurring at the right time or two of your cylinders are connected wrong. See that the commutator brush points upward when the exhaust valve of the front cylinder is closed. The firing order 1, 2, 4, 3. To check your timing. crank the engine over until the piston in number one cylinder is at the end of the compression stroke. The commutator roller should then be in position to make contact with the terminal of the wire leading to number one terminal of the coil box. Then give the motor exactly one-half a turn. The commutator roller will then rest on the terminal of number 2. Give the motor another half turn. The roller will then rest on the number four terminal.

Differential Trouble.

I have a 1913 Ford car. Last year the differential gear and pinion broke. From that time the differential makes a deep grinding sound. What is the trouble and how can it be remedied?

Answer.—One or both of your axles may be bent. They should be removed and replaced or repaired if defective. It may be that the housing is sprung in such a way as to cause the gears to mesh a little too tight. Make sure that the axles are not badly worn at the bearings. A heavy transmission grease will lessen the noise, but if there is any serious mechanical trouble it should be corrected. Some gears are noisy when no trouble exists and the reason for the noise is often impossible to discover. The most probable cause of your trouble is sprung axles.

Oil Works Up.

We have a 1915 Ford car. Since the weather has become a little warmer, the cylinder oil works up into the spark plugs and out of the muffler. What causes this? What is the remedy? Does this oil injure the spark plugs or any other parts of the car? The oil we are using is not very thick.

Answer.—It is better to use a thicker oil in summer than in winter. Oil of itself does no injury to the spark plugs or muffler, but it is very likely to form carbon deposits and interfere with the ignition. It also causes smoke and your car is evidently wasting considerable oil. Try using a heavier oil and do not carry more oil in the crank case than the regulation amount. If this does not eliminate the trouble you should obtain new rings or slightly larger pistons. Small pistons are often the cause of too much oil working up.

Telephone Generator for Ignition.

How could I make a magneto for a two-horse-power gas engine out of a telephone generator? The engine uses a jump spark coil. The generator is five bar, 1,600 ohm. Turning it by hand, the generator generates three volts. Would this generator give a good spark at engine speed of 700 R. P. M.?

Answer.—We do not recommend the use of a telephone generator on an engine. The telephone generators are seldom made durable enough to stand the strain of continuous service. You might mount your generator on or near the engine and run it by a belt from the engine shaft. It is probable that a speed of 500 R. P. M. would be sufficient. This is a matter of experiment. Ground one terminal of the generator and run the other to a three-point switch. Ground one terminal of your battery and run a wire from the other terminal to the switch. Run a wire from the center post of the switch to the battery terminal of the coil. To start place the switch on "battery." Throw the switch to the magneto side after the engine reaches running speed.

Ford Axle Trouble.

Am asking your advice on a Ford car that has rear axle trouble. A boy once assembled the rear axle, leaving out the thin washers. The housing would not come together and it leaked grease. Also some parts were worn out and broken on this account. I put in new parts and assembled the axle with the washers in place, and the housing closed up nicely. The car jerked some before I worked on it and it did afterwards, but I attributed that to worn transmission bands. The car had already stripped three sets of gears. The gears stripped again and one axle shaft broke. The man who worked on it said that an axle shaft had been sprung, which caused the car to jerk and chip the gears. Do you think this theory is correct? How can I test the axle shafts for trueness?

Answer.—A sprung axle shaft could cause your gear trouble. The best way to test an axle shaft is to remove it from the car and put it in an engine lathe. If the shaft is out very much it can be noticed by the "wobble" of the wheel on that axle. This is not a sure test, as the wheel itself may not be true. We are rather inclined to believe that your axle housing itself is sprung. This also would cause your trouble. As your car was run for some time when improperly bolted together, it is very likely that the housing itself is sprung If you have any more trouble you better send the whole rear system to the nearest Ford branch house, stating the trouble you have had.

Polarine and Dependability Go Hand in Hand

POLARINE FRICTION-REDUCING MOTOR OIL

Use Polarine and your car will stay in service summer and winter. You won't have to lay it up for repairs caused by excess friction.

Polarine covers even the remotest reciprocating surfaces, reducing friction to a minimum and enabling your engine to deliver to the rear wheels the maximum of power it is capable of developing.

Polarine is a dependable oil as may be attested to by the fact that 450,000 motorists are using it in the Middle West alone. Polarine sales are increasing at the rate of more than ne million gallons per year.

The Standard Oil Company recommends its use for any type or make of standardized automobile engine.

Order a half barrel today. It costs less that way than in smaller quantities.

Polarine flows at zero and maintains the correct lubricating body at any motor speed or temperature.

PATENTABLE IDEAS WANTED. Manufacturers want Owen Patents. Send for three free books: inventions wanted, etc. I market your invention without charge. Richard B. Owen, 37 Owen Bldg., Washington, D. C.

Kindly mention this paper when writing

THIS department is edited by a competent poultryman, who will be pleased to answer questions concerning diseases, poultry management, etc., when they can be answered through the department. Questions will not, however, as a rule, be answered by mail, and stamps need not, therefore, be inclosed with inquiries. Address all letters relating to poultry topics to this office.

Number of Males to Keep With Flock.

"E. L. L." asks the following question in regard to the number of males to keep in a farm flock:

Will you please advise me how many roosters to keep? People have such widely different opinion in regard to this matter. I have 130 hens, and have kept fifteen males, and rather think it too many. Would be pleased to know what is right.

Much depends on the breed of fowls kept. The smaller, more active breeds do not require nearly so many as the larger, heavier kinds.

Leghorns do very well with not more than one male to fifteen or twenty hens. It always seems that one Leghorn in the flock and the chicks are all Leghorn, or partly at least.

For the larger and somewhat less aggressive breeds, like the Rocks, Wyandottes, etc., we keep one male for each dozen hens and one extra for every six, which would make your number not far wrong. One or more of the cockerels are almost certain to be impotent and then we must take the chance on losing some.

On the other hand, too many males is fully as bad as too few, and especially if they be kept in limited quarters.

If there seems to be unnecessary worry of the hens confine a few of the heads of the ranch and hold them in reserve for possible need.

Canker Complicated With Chickenpox.

"Mrs. F. M. F." is experiencing trouble in her flock of White Wyandotte fowls from canker and later the trouble is made worse by the appearance of chickenpox. She writes:

I have several White Wyandotte cockerels that are pure bred, and they seem to be troubled with canker in the throat. I have used permanganate of potash, burnt alum, tincture of iron besides burning the throats with caustic potash. Nothing seems to cure them. One has had the trouble all winter, and does not die, neither get well. Also, one cockerel broke out with pocks all over his head, he died. Can you give me any cure or probable cause of the trouble? I have fed wheat, bran and ear corn. All the skim milk they could drink, and grit always before them. There is litter for them to exercise and a window covered with burlap has been open all winter.

The trouble is canker in the throat and in the cockerel that died the trouble is chickenpox. The former ailment is a severe type of roup or diphtheria, as it is sometimes called. Only that there are patches in the back of the throat it would be difficult to know when roup leaves off and diphtheria begins.

These patches become enlarged, run together and in some cases the fowl cannot get its breath. Death often comes from constitutional poisoning. Treatment is doubtful wisdom and, even though the fowl gets well, apparently, it would be fully six months before it would be well for practical purposes.

If doctor you must, twist a bit of absorbent cotton about a toothpick and dip in creolin. Hold it a moment against the membrane, being very careful that not enough is on the cotton to drop into the windpipe. Move the cotton gently over the patches and they will finally come away, leaving sore spots. Apply boric acid solution and dust with flowers of sulphur.

As you value your future flock, do nothing of the kind. Kill every bird that is affected, burn the carcass and clean up all litter and spray houses and yards with a strong antiseptic.

The permanganate of potash is all right. It is not a medicine, but a germicide that keeps the trouble from spreading through the water.

This drastic measure does not apply to the fowls that have pocks broke out over their heads. This is only chickenpox, which of itself is not serious. The death of the cockerel was very probably not from canker, but from a complication of troubles. Do not destroy a bird because it has chickenpox. Unless it is so anemic from disease as to be constitutionally weak it should come out all right. Many cases of chickenpox are confused with canker and other forms of roup.

The potash in the drinking water will help to keep this trouble in check, which, as a rule, soon passes and the fowl is no worse for the trouble.

Preserving Eggs.

Now is the time to preserve eggs. The waterglass method worked out by Prof. E. F. Ladd, of the North Dakota Agricultural College, is very simple. Eggs put up according to it will retain their original flavor.

Directions: The eggs must be fresh and clean. Washing an egg spoils its keeping qualities. Galvanized iron vessels, crocks, jars or wooden kegs may be used. The vessel must be clean. If of wood it must be thoroughly scalded. Use a good grade of waterglass. One like a heavy white jelly that flows like cold molasses. Use one quart of the waterglass to ten quarts of pure water that has been boiled. Pour into the vessel when cool. Fresh eggs can be put into it from time to time until the jar is filled. There should be two inches of the solution above the eggs.

Keep the preserved eggs in a cool place, as in a cellar. The eggs will contain some gas and so crack when boiled. This can be prevented by making a pin hole in the blunt end of egg before boiling them.

Shipping Little Chicks.

To the Editor:—If the lady who wanted to know how to ship little chicks will fix a basket as follows I do not think she will lose many chicks by shipping. Take a market basket and place two thicknesses of newspaper in the bottom and just high enough around the sides to leave a row of holes all around the sides. Then put in chaff from the hay mow to a depth of about one inch. In this I put a little fine chick food. Then place thirty-five chicks in the basket and put a piece of flannel over the top. Let this hang down far enough to almost touch the chicks. Put a piece of burlap over this and sew tightly over basket. I send chicks this way and purchasers pay for the live ones received. I have not lost very many in shipping. Have shipped fifty in one basket if large.

Mrs. Robert Hunt.

A Good Start For the Chicks.

To the Editor:—The early life of the chick is always the most critical. Many chicks are lost between the ages of one or two weeks. This is not only due to improper feeding but to the improper selection of the breeding stock from which the chicks are hatched.

Now, commencing with the very beginning of the chick's life, if the chicks are hatched under a hen I would advise taking them from under her as soon as the chicks are dry, only have one or two under her and putting the remainder of them in a basket lined with flannel or other woolen goods. Set them near the stove or in the sun. Chicks may be left in an incubator, although sometimes it is necessary to remove them because of need of room.

After the chicks are two days old we put them with the hen or in the brooder. They are now given their first feed, which consists of a few dry bread crumbs and steel cut oat meal. Be sure to not give them wet feed, as the feeding of highly moistened feed ends up with bowel trouble. Always give them just a sufficient amount of feed so that they clean it up at each meal. Overfeeding is perhaps the most important factor in rearing the chicks. It is a very easy matter to do this and one must feed sparingly for the first week or so.

They are also given their first drink, which must be placed in shallow fountains. I would suggest a good home-made fountain made with a saucer of water with a tumbler upended in it. This affords a small fountain, but will auswer the purpose for the first two weeks. The chicks cannot get wet when water is given to them in this way. This is an important matter when the chick is at this stage of life.

Continue the ration of steel cut oat meal, dry bread crumbs and a very small portion of boiled eggs, which perhaps have been tested out and found infertile and set aside for this purpose. I would not advise giving the chicks much of the boiled egg in the start, as it is hard to digest and there are other foods which are more essential.

The second week feed steel cut oat meal, cracked wheat, dry bread crumbs, milk mash, with a necessary amount of grit and charcoal, also giving them free range and plenty of green food.

The third and fourth weeks continue the steel cut oat meal, cracked wheat and a small amount of cracked corn, and throw this mixture into a litter of chaff, etc., about three inches deep. This affords them the proper amount of exercise and at the same time they are having their regular feed.

I would suggest the use of milk or buttermilk, as it affords the chick a change in its daily rations and is one of the best nourishing foods to be had. After the chicks reach the age of six weeks more coarsely cracked feeds may be fed, such as a mixture of wheat, corn, oats, barley, rye, buckwheat and kafir corn, and twice a week they should be fed meat scraps.

Another important part in the rearing of chicks is to rid the chick of its greatest enemy, the louse. Perhaps the most simple method of extermination is by the use of lard. A drop of lard rubbed upon the head of the chick will usually be sufficient, as the louse always stays near the head of the chick. The lard will be found to be very effective, although some insect powders are just as good.

Clarence C. Bisdorf.

BUY NOW! ONLY 30 DAYS MORE!

If you want to take advantage of my special 90-day proposition and buy Galloway Spreaders, Cream Separators or Gasoline Engines at the lowest prices they've ever been offered you must act quickly. 30 days are all you have left. May 31st is positively the last day. I repeat the offer briefly. For a limited time—until May 31st—I am making a special proposition to the first ten or more men in each township, as a special advertising proposition.

10,000 GALLOWAY ENGINES

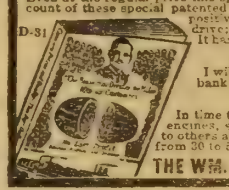
Galloway engines are so far ahead of other engines that one invariably sells from two to six more in each neighborhood. For that reason I can afford to cut THE PRICE of the FIRST TEN INTRODUCTORY ENGINES sold because of the great number THEY will sell. I'm doing the GREATEST ENGINE BUSINESS in the country. But I'm not satisfied. I want to treble it. I want to sell 10,000 ENGINES during the 90 days up to May 31st, and I have taken THIS WAY of doing it.

10,000 GALLOWAY SANITARY CREAM SEPARATORS

What I have said of my engines also applies to my Sanitary Cream Separators. YEAR BY YEAR my cream separator business has GROWN BY LEAPS AND BOUNDS. I've SAVED farmers MONEY and in return they've SOLD THEIR FRIENDS. These friends have BOUGHT, SAVED MONEY and told their friends until my separator business has reached the point WHERE IT IS ENORMOUS. If you are not acquainted with the Galloway separator, send for my free catalog. Read it over. Then order one of these machines BEFORE MY 90-DAY OFFER EXPIRES.

10,000 GALLOWAY MANURE SPREADERS

I have also included my New No. 8 Low Down Manure Spreader in this 90-day offer. Even at the regular price this spreader is WORTH $50 MORE than any other spreader made on account of these special patented features, exclusive on Galloway. All-steel beater and V-Bar; positive roller feed, patented automatic push board; double chain drive; cut-under front trucks and pressed steel unbreakable tongue. It has no equal at any price. Order one on trial.



5 LIBERAL BUYING PLANS

I will sell on terms to suit you—all cash, half cash and half note, bank deposit, full note settlement or on the installment plan.

GET THIS BIG NEW 1916 FREE BOOK

In time to take advantage of our cut price offer. It tells all about Galloway engines, separators and manure spreaders. It shows why THEY ARE SUPERIOR to others and also how we can give you BETTER MERCHANDISE and still save you from 30 to 50 per cent, not only on farm machinery but on clothing and house furnishings as well.

LEGAL DEPARTMENT

SUBSCRIBERS who desire questions answered in this department should base them upon a brief, plain, concise statement of the actual facts. To insure immediate attention, inquiries should be addressed to "The Legal Department," in care of this paper; but as the inquiries sent are at times very numerous, thus delaying printed answers, those to whom it is important to receive an immediate reply by mail, should remit $1.00, addressed as above. All inquiries must be signed if they are to receive attention.

Private Property For Public Use.

Eminent domain is the power of the state to take private property for public use, without the owner's consent. This power belongs to every independent government. It is an inherent element of sovereignty. The people of this country have delegated the right to exercise this power to the legislative bodies of the various states, and to congress, by constitutional provisions containing express limitations. The substance of such limitations generally is that private property shall not be taken for public use without just compensation being paid to the owner thereof.

Private property is taken for public use by what is generally known as condemnation proceedings, and the compensation to the owner is assessed by a jury, or by commissioners of freeholders appointed for that purpose—there being some differences of detail among the laws of the several states. Just compensation to the landowner necessarily embraces two main elements of damage to his property. First, damage arising from a certain quantity of his land being actually taken and occupied for the public use. Second, damage resulting to the residue of his farm or tract, by reason of the public use being so located. As a right of way for a public road, or space for other public uses, actually occupies a certain area of land, it is comparatively easy to determine what damage will result to the owner by being perpetually deprived of its use. Generally this is the actual value of the area taken. As to the second element of damage, there is usually considerable difficulty in reaching a fair and equitable estimate of the owner's damage. For instance, a public road, or a railroad might be located across a farm in a diagonal direction, causing fields to be of irregular shape, or might separate a small area from the main body of the farm and impair its value, aside from the land actually taken, or it might interfere with the flow of surface water or cause extra fencing, or be so near buildings as to cause inconvenience. All such matters should be fully considered in estimating the second element of damage, that done to the residue of the owner's land. These matters affect the value of the land not actually taken for use, and when they are fully considered the question to be determined is this, viz.: What is the difference between the value of the residue before the public use was exercised and its value afterwards? In other words, how much less is the residue of the land worth after the strip for right of way is taken than it was worth before? Whatever that difference is in money constitutes the second element of compensation or damage above mentioned.

In estimating the value of land before and after a right of way has been taken from it the probable general effect of a road, railroad or other improvement upon the value of property should not be considered at all. For instance, suppose a farm over which a railroad right of way is to be taken is worth $100 per acre and other similar farms in the neighborhood are of like value, but the effect of the railroad enhances real estate values and causes such farms to be worth $125 per acre such effect is not to be considered by the jury or commissioners in assessing the compensation to be paid to owner whose land is taken for such public use. The expected benefits and advantages which the proposed road or railroad will bring to the landowner in common with others in the same locality cannot be set off against this claim for compensation, or in settlement of any part of it.

LAW QUESTIONS.

Ownership of Organ.

A Subscriber, Glidden, Wis.—My stepson bought an organ when he was nineteen years old and living at home. He is now married and has a family and he claims that the organ belongs to him and that his mother told him he could have it at her death. His mother died last summer. Has he a right to have the organ?

Answer.—The organ belongs to your stepson and he has a right to take it.

Renter's Rights—Township Board.

A South Dakota Subscriber.—(1) I leased a building for pool hall purposes, for six months at $10 per month payable in advance on the 19th day of every month. All fixtures to remain in the building until the rent has been paid. My lease expires on the 19th day of May, 1916. Can I pay all the rent, and move out at any time, or can the lessor compel me to stay until my lease expires? (2) Has the township board the right to close a pool room at eleven o'clock p. m. in an unincorporated town in South Dakota?

Answer.—(1) You can pay all the rent and move your fixtures from the place at any time. (2) The township board has power by law to make rules or by-laws closing a pool room in the township at eleven o'clock p. m.

Exempt Property.

A Subscriber, Wheeler, Wis.—(1) A widow owning only forty acres of land, and some personal property, made a will leaving her property to her son. Before her death a judgment was rendered against her. Will her son have to pay said judgment in order to get clear title to the land? (2) How much personal property can A person in Wisconsin hold exempt against a judgment?

Answer.—(1) The forty acres of land owned by the widow was exempt against the judgment rendered against her and her son will not have to pay the judgment in order to get title to the land. (1) The following personal property is exempt as against a judgment, viz.; Bible, books and pictures, household and kitchen furniture, one gun and sewing machine and other dofestic utensils, farming implements, yoke of oxen or a team of horses or mules with harness or tackle, two cows, ten sheep, ten hogs and feed for said stock for one year, provisions and fuel for family for one year, one wagon, cart or dray, one plow and drag, and wages earned of $60 if one has a family.

Partition Fence—Notice to Trespassers.

A Subscriber, Hancock, Wis.—(1) My farm is partly under cultivation, and the land adjoining is timber land. The partition line has not been fixed by a survey. Can I compel the owner of the timber land to make his share of a partition fence? (2) If a survey of the division line is necessary to be made, who is liable for the expenses of the survey? (3) How shall I post notices to keep hunters and trespassers off my farm?

Answer.—(1) If the owner of the adjoining timber land does not use it for cultivation or farming purposes, but allows it to lie open and unfenced you cannot compel him to build any part of a partition fence between his land and yours. (2) Even if he encloses his land and uses it for farming purposes before a partition fence is erected the division line must be fixed, either by agreement or a survey, and the expense of such survey should be borne by both parties. (3) Post in conspicuous places two sign boards one foot square on each forty acres of your land forbidding hunters and trespassers from going thereon.

Contract by Officer.

Mr. O. M. A., Buffalo Lake, Minn.—Does a member of a town board in Minnesota have a right to take a contract to do road work, or other public work let by the town board, by which such member will receive a financial benefit and if not, what is the remedy in such a case?

Answer.—In such a case the member of the town board would be guilty of a gross misdemeanor, the penalty for which is imprisonment in jail not more than one year or a fine not exceeding $1,000.

Why PRINCE ALBERT gives smokers such delight!

Ralph Bingham discovers the "national joy smoke"

—*why*, its flavor is so different and so delightfully good;

—*why*, it can't bite your tongue;

—*why*, it can't parch your throat;

—*why*, you can smoke it as long and as hard as you like without any comeback but *real* tobacco happiness!

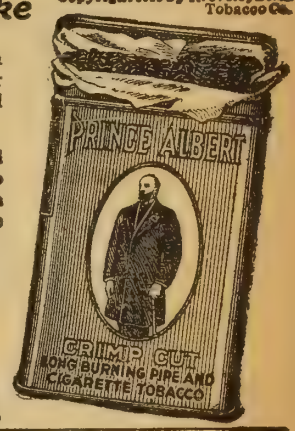
On the reverse side of every Prince Albert package you will read:

"PROCESS PATENTED JULY 30TH, 1907."

That means to you a lot of tobacco enjoyment. Prince Albert has always been sold without coupons or premiums. We prefer to give quality! And read this:

PRINCE ALBERT
the national joy smoke

Copyright 1916 by R. J. Reynolds Tobacco Co.



is certainly worth your while getting on talk-terms with if you'd like to know what will please your jimmy pipe or cigarette makin's appetite *most*—in flavor, coolness and downright satisfaction to the high-top-notch degree!

For Prince Albert is tobacco made by an exclusive patented process *that cuts out bite and parch* and lets you fill up your pipe or roll 'em to your heart's content without a flareback of any kind! You'll get chummy with Prince Albert in a mighty short time.

Prince Albert is sold everywhere in toppy red bags, 5c; tidy red tins, 10c; handsome pound and half-pound tin humidors and in that fine pound crystal-glass humidor with sponge-moistener top that keeps the tobacco in such perfect trim—always!

R. J. REYNOLDS TOBACCO COMPANY, Winston-Salem, N. C.

Potato Organization.

A number of Rusk county farmers met recently and organized a Ladysmith Potato Growers' Association. Mr. Dell Richards was selected leader and Mr. A. A. Hadden secretary and treasurer. Twenty farmers joined the organization and the association adopted the Rural New Yorker and Green Mountain varieties as community potatoes. Each member had agreed to plant at least one bushel of these varieties this season. The purpose of the organization is to standardize potatoes as to variety in the neighborhood of Ladysmith and incidentally to make Ladysmith a potato seed center. The association has decided to offer a silver cup to the member who exhibits the best bushel of potatoes at the Rusk County Fair.

Rusk County Crop Yields.

Mr. A. G. Martindale, of Rusk county, is one of the successful Upper Wisconsin farmers. He has succeeded in making some splendid crop records. In 1914 he raied 640 bushels of potatoes to the acre and sold these potatoes at an average of $1 a bushel. The same year he raised onions that yielded at the rate of 416 bushels to the acre and sold these also at an average price of $1 a bushel. Last year he raised parsnips which yielded 648 bushels to the acre and which he sold for 75c a bushel. On the parsnip crop his returns were at the rate of $486 an acre. These records are an evidence of what can be done in Upper Wisconsin by careful farming. Mr. Martindale is not an extensive user of commercial fertilizer. He is, however, a careful farmer.

Seed Situation in Rusk County.

G. M. Householder, Rusk county agricultural representative, has been assisting farmers in the work of securing seed corn which will be good for Upper Wisconsin this year. He has found a limited quantity of Northwestern Dent, and Early Yellow Dent, according to his report. The representative further has agreed to assist those farmers who have good seed corn for sale, to market the same. In this manner he is aiding the farmer who is short on seed corn and the farmer who has a surplus to get together. Mr. Householder has advised his people that seed corn will cost considerable money this year, but that it is preferable to pay a good price for seed which will germinate than to get seed at a small price which will not come up. A good deal of seed corn which will be used in Rusk county this year is the kind which will be purchased for $4 to $5 per bushel. Mr. Householder says that the buyer of seed corn should consider that a bushel of first-class seed corn ought to produce 300 bushels of corn and that this should be worth from $130 to $150 next fall. So that a dollar or two on the price of seed is not a matter of such great importance as is the matter of getting the right kind of seed.

Treatment For Smut.

Mr. J. S. Klinka, county agent for Polk county, has called attention to the damage from grain smuts last year. These smuts were unusually destructive in 1915 on account of the weather conditions. Smut was especially noticeable upon oats. Mr. Klinka reports that in one of the fields near the town of Balsam Lake the loss due to smut was 8.8 bushels per acre, or about 13 per cent, on the assumption that the average yield was sixty bushels per acre. Mr. Klinka reports that as far back as 1700 grain was treated for smut. In those early days salt water was used and the process was generally spoken of as "pickling grain." In 1880 Jensen, of Copen- d the hot water treatment. found to be effective, but rather a dangerous method, for the reason that a very small rise in the degree of temperature of the water would kill the grain. Mr. Klinka is advising the farmers of his county to use formaldehyde today. It is generally used throughout the country for the prevention of all smut. A pint of formaldehyde in thirty gallons of water will make a solution that will control losses from smut. The usual method is to put the oats into a gunny sack and soak in the solution for five minutes or until all the kernels have been moistened. Pour the oats upon the floor of the granary or barn and cover for a few hours. Avoid heating the grain and increase the usual rate of seeding three or four pecks.

Barron Creamery Report.

According to a report of the Barron County Creamery, located at Barron, Wisconsin, there were 265,730 pounds of cream received during the month of March, 1916. The total butter fat production for the month was 67,819.6 pounds, and the price paid averaged 40c. This creamery has 720 patrons and more than 200 of them received cash to the amount of $50 or more during March.

The Strawberry Weevil.

The strawberry weevil will be active soon. He was discovered coming out of his winter-long hibernation at University Farm, St. Paul, by S. Mareovitch, of the division of economic zoology, April 20th.

A shortage in the number of blossoms is the first indication of the work of the strawberry weevil. It cuts off the buds, after depositing eggs in them. The weevil is about one-tenth of an inch long, and because it is seldom seen on account of its size, the effect of its ravages are usually blamed on the frost, hail or climatic conditions.

The strawberry weevil has been successfully fought at the New Jersey experiment station by a dust spray of a mixture of arsenate of lead and sulphur. One pound of each was used as a repellant, giving almost perfect protection. The mixture was applied April 30th and May 6th. Another method advocated by S. Mareovitch, who discovered the pest at University Farm, is removing the straw from one or two rows to hasten the maturity of the buds and to keep the straw on the rest of the patch to force the weevils to the uncovered row. They could then be destroyed either by plowing them under or burning over the uncovered row.

The weevils do not scatter readily and hibernate in the field, so the one-crop system is a safe method of fighting them. The ground should have crops changed for at least a year if the weevils are found.

Garden Notes.

The "follow up" planting of late sweet corn or fall turnips after crops of early peas and radishes should have a place in the garden plan. If one worked out a chart it would show the arrangement or rows, all spaced at least twenty-four inches apart to allow for horse cultivation, which should be frequent so as to keep the soil in good tilth, conserve moisture and destroy weeds.

A few things to remember in garden making as given by J. R. Hepler, gardener at the agricultural experiment station, are:

Give each vegetable plenty of room to develop. Plants with spreading tendencies, like tomatoes and squash, must not be placed too close in the rows. Four by four feet for the former and five by six feet for the latter are suitable distances.

To save space, sow an early crop of lettuce or peas between the squash or tomatoes. Radishes, turnips, onions, spinach and endive are other crops which may be used for fillers.

Get the garden soil in good condition to receive plants from the hotbed Plowing or spading must be followed by harrowing or raking until the soil is fine and loose.

Puddling the roots in water or watering the plants right after setting out should be practiced to keep them from wilting. It may be advisable to cut off half the leaf surface in setting out the plants so as to balance the top with the roots which are frequently broken off in planting.

Little Potato Disease.

The little potato disease causes little potatoes as big as a pea or a little larger to form on the stems, and no potatoes form on the roots. The reason is that this disease closes up the pores in the stem so the starch made in the leaves cannot go back to the roots to form potatoes. Potatoes affected with this disease have small spots on the surface made up of germ masses, that look like a little soil stuck on the surface. The difference comes out when one tries to remove the spots. They do not come off, while soil will. This disease is also called russet scab and Rhizoctonia. It is best not to use affected potatoes for seed. If they must be used first treat for two hours in a solution of four ounces of corrosive sublimate to thirty gallons of water. (Corrosive sublimate is now $4 a pound.)—[D. G. M., North Dakota Experiment Station.

The Cabbage Crop.

To the Editor:—There are many charms in cabbage culture not to be had with other crops. They are easy to germinate, easy to transplant and give response to rich soil and good cultivation. Besides the satisfaction of having all the cabbage that can be utilized on the table, there is always a good cash remuneration from the salable cabbage.

Cabbage requires a rich and moist soil for rapid development. The soil should be stirred deep—twelve inches being none too deep for the roots to be able to penetrate well into the soil. Low land is preferable for cabbage growing, yet clay land mixed with sand and a liberal application of well-rotted stable manure will grow good cabbage. It doesn't matter so much what kind of land, if it is good soil and contains plenty of moisture. Cabbage will yield all the way from five to fifteen tons of cabbage to the acre.

It is one thing to grow a crop of cabbage and another to get them off to market at a profit. The cabbage grower should plan out his work ahead, considering the varieties that would be best suited to his location, and also the marketing problem. The man who jumps to the conclusion that all there is to cabbage culture is the art of growing them and that the marketing will only be an afterthought is sure to end in a rash failure and one crop will be all he is looking for, being now ready to turn to another failing venture.

When setting the plants the rows must be made straight, as the first plowing must be done with the cultivator, going as close to the plants as is advisable. The number of plants grown upon an acre must be decided by the habits of the varieties. From 6,000 to 7,000 Early Jersey Wakefield may be planted on an acre and will do well crowded in, while half that number of late cabbage will be sufficient on the same amount of ground. Frost-proof plants may be set in the field as early as April 15th and from that time on till June. The earliest cabbage on the market is usually the ones that command the best price. Plants are easy to transplant if the soil is mellow and moist.

To grow cabbage successfully the fields must be free from weeds. The first cultivations cause the plants to make more rapid growth, covering the ground so that cultivation becomes unnecessary.

If the ground is plowed deep in the fall it will not need reworking in the spring except a thorough harrowing. Worms are never bad on early cabbage, making them much easier to grow than late ones. The ground should be stirred at least once a week till they are too large for cultivation.

E. E. R.

A South Lincolnshire, England, farmer who has extensive lands is now employing more than sixty women and proposes shortly to engage many more.

Guaranteed Seed Corn

WE recently sent average identical sample of our Northern Iowa latitude grown and Central Minnesota (Redwood Co.) grown seed corn to the foremost agricultural college of this country and have just received their official report, as follows:

Nor. Iowa lat. grown.		Cen. Minn. (Redwood Co.) grown.	
Wimple's Yellow Dent	97%	Northwestern Dent	96%
Iowa Gold Mine	96%	Wis. No. 7 or Silver King	92%
Goddard's Sil. King	94%	Minnesota King	96%
Reid's Yellow Dent	97%	Minn. Ea. Yel. Dent	92%
Minnesota No. 13	90%	Minnesota No. 13	88%
		Minnesota Early White Dent	73%

THESE LOTS ARE ALL 1914 CROP

The above tests prove that our stocks of genuine NORTHERN GROWN Seed Corn are the highest qualities you can buy—regardless of price.

We Give You a Sworn Statement as to Where Our Seeds are Grown

We do not handle any dent corn from either central or southern Iowa, Nebraska, Kansas, Missouri or Illinois, as such seed, although of good germination, cannot ripen and mature in the north. Look at your map. **Don't buy seed corn that is grown south of you.**

We GUARANTEE every bushel of Seed Corn we ship to be exactly as represented in every particular or money refunded.

Get our FREE catalog at once and send your order promptly if you want any of the above lots.

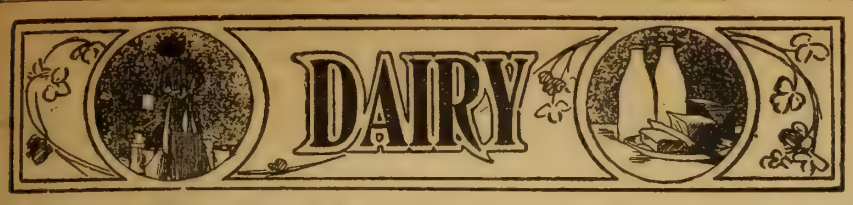
SEED CORN—Reid's Yellow Dent. Matures from 90 to 100 days; germination from 95% to 98%. J. N. Hutchinson, Dixon, Illinois.



Ropy Milk Caused By Bacteria.

Summer dairying is occasionally a source of worry to the dairyman because the milk becomes "ropy." A condition of this kind usually causes considerable loss because of the fact that milk so affected is absolutely unsalable or unusable. It is practically on a par with sour milk and in so far as human consumption is concerned is just as much of a waste. In the first place, ropy milk is caused by bacteria of some kind. In some cases udder troubles are the original causes, in others contamination with bacteria outside of the udder is responsible. If the condition of the udder is responsible this fact will be noticeable when the milk is being drawn. If the milk does not become ropy until afterwards the cause is probably an external one.

If a bad case of udder trouble is responsible it may be advisable to at once consult a veterinarian and have the trouble remedied. If the cause is external the condition of the utensils being used should be noted. Crevices and inaccessible places in pail or can filled with bacteria may be responsible. If such is the case the remedy is obvious.

Brooks to which the cows have access may be filled with the bacteria and these bacteria may find their way to the flanks and udders of the cows and thence to the milk pail. In any case ropy condition of the milk is directly under the control of the dairyman and if he allows a drain upon the season's profit without attempting the comparatively simple remedies sympathy would be wasted. The careful dairyman will not be troubled long with ropy milk in his herd unless in the case of garget or severe udder troubles and in these cases the herd should at once be placed in a veterinarian's hands for a quick cure.

Better Butter From Graded Cream.

When butter is sold at the neighborhood store it is impossible to discriminate between a good and bad product, if the merchant values his customers or his reputation. Men may face cannon or brave death in many ways, but no man ever yet had the hardihood to tell a woman that she made poor butter.

As dairy people become more dependent on the creamery it lessens the liability of making enemies of them. People are not slow to grasp an opportunity if there be an addition to their incomes at the end of it, and especially if there is a like opportunity to lose out. A grain belt dairyman is on the right road to improvement, by grading all cream that is brought to him. He sends out small circulars which say:

I will hereafter grade all cream. It is only treating everybody fair. It is not fair for one patron to take good care of his cream and another not care for his cream. The market demands a better grade of b tter, and the creamery that can produce a high grade will get the top price. The better grade of cream we can get, the better grade of butter we can make. That will bring the patrons more money, and bring the creamery more patrons. Now, let us work together; I will give you some rules for caring for your cream, and if you follow them you will have first-grade cream.

In the winter keep your cream just as cool as possible, so that it will not freeze, until the night before going to the creamery. Set it in a room where there is a fire in freezing weather. If it freezes it will grade second.

In the summertime, separate your milk as soon after being drawn as possible. Set the cream in a pan of cold water and cool as soon as possible. Then pour the cream into the can and hang in the well.

Do not mix warm cream with cold. I will make two grades. There will be No. 1 and No. 2. No. 1 will be worth 2 cents more than No. 2. Cream that will not grade as No. 2 will be returned to the patron who sent it.

This creamery is setting an example that will benefit its stockholders, its patrons and humanity in general. There is just as much opportunity to help the uplifting problem of which we hear so much these days, in applying educational methods to our common everyday work as in all other lines combined. More and more, each and every line of work and industry is being lifted to a higher plane. The result is twofold it makes better living possible, as well as training the mind along the path of higher ideals.

Care of Dairy Products, Cooling Emphasized.

To the Editor:—There are two seasons of the year when the buttermaker or cheesemaker has the most trouble with the quality of milk or cream delivered. They are spring, the first warm spring days, and the fall, during the busy time of threshing. The reasons for this condition are as follows: During the winter nature undertakes to cool the milk or cream, last winter very effectively, and it takes a little time before the farmer realizes that he has to be on the job. It is only when he gets a complaint from factory, creamery or station that he gets busy. During threshing season the farmer is simply so busy he neglects the cooling process, so necessary in producing dairy products of quality. As a result, poorer butter and cheese is made at these seasons than any other.

Another possible reason for poor quality spring cream or milk is access to wild onions. This is not common everywhere, but it is serious while it lasts. Then, again, as feed becomes short, usually the poorer grades are fed. This latter condition also affects fall grade of milk and cream. As grass becomes short cows eat, of necessity, not from choice, weeds which give peculiar and undesirable flavors to milk.

The two important factors in the care of milk and cream are cleanliness and low temperatures. Of the two, the latter is by far the more important. Still more important is the speed with which the milk or cream is cooled to this low temperature. Not one farmer out of ten realizes that to produce milk of good quality or cream that will make high-grade butter the milk or cream has to be cooled at once and kept cool. How cool? As low as the temperature of most freshly pumped well water, between 50 and 60 degrees.

You say, why the hurry to get it cooled? In the first place, the milk does not stand around warm, absorbing odors of stable. In the second place, to keep the bacteria from multiplying. Suppose you leave milk or cream standing around for two hours. At the end of that time it is sixty-four times as dirty from a dairy standpoint as it was at the beginning. How can that be? Simple enough. It is well known that bacteria multiply by fission or division. Under right conditions of feed and temperature each plant divides and becomes two at the end of twenty minutes. Now, warm milk is just right. At the end of twenty minutes there are two; at forty, four; at sixty minutes, eight bacteria; at the end of two hours, sixty-four bacteria. Your milk is just sixty-four times as dirty as it was.

Cool and cool at once. How? By setting the can of milk or cream in cold water and then leaving it. That will help, of course. But if you think a little you must know that unless stirred the outside body of the liquid becomes cooled while the center is still warm. Here, in the warm center of milk or cream, the bacteria rejoice and wax exceedingly fat and abundant. Therefore, stir the liquid occasionally and the water around the can, too. A little ice would help; in fact, if it is milk for city delivery, both ice and mechanical coolers are needed. But for the farmer, if his cooling tank is between his stock tank and pump, and covered, with forced circulation through all parts of the tank, he can easily keep his cream sweet three days and more. How marked a difference in quality of butter there would be if all cream producers delivered sweet cream. It would mean millions in the pockets of the farmers.

How about cooling the warm cream before mixing? Sure. Same reason as above. To keep the bacteria from multiplying. Add warm cream to cream already cooled. You raise the temperature of the whole lot and the bacteria, dormant for a time, again become active. Cool and keep cool.

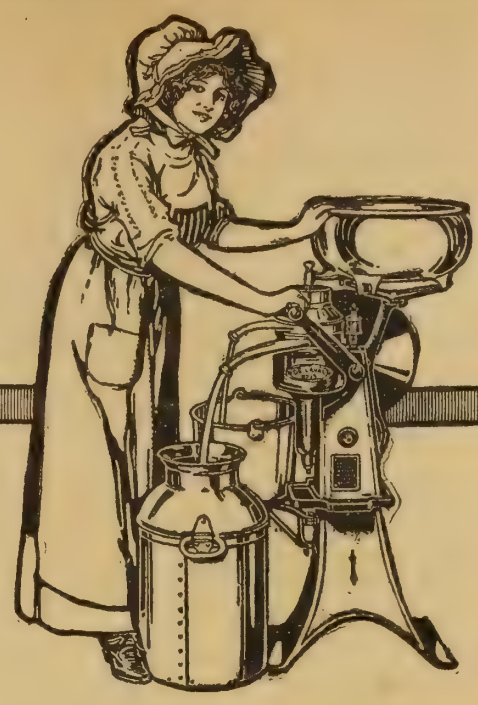
But, you say, what is the use? Doesn't the buttermaker sour the cream anyway? Yes, he does, but he does not get the same uniform results if he accepts your sour cream, your neighbor's sour cream and that of several other neighbors and mixes it all together that he would if he took sweet cream and soured it himself with an artificial pure culture of sour milk and had control of the ripening process. The best butter in the world may be made on the farm, but it is not. It varies in flavor, texture, grain, salt, color. So with mixed lots of sour cream. There is no uniformity in flavor. The buttermaker or cheesemaker is not asking for sweet goods, asking you to go to more work to save himself work. Not so. The easiest way for him is to dump it all into the vat, sour and sweet, cool it and churn it. He asks you to care for your milk and cream so that he can take pains with a fighting chance to get a No. 1, uniform article. In return, you get more for your goods.

Be cleanly in your milking practice. You can't all wear white suits, but you can have clean hands. You can also construct your cow stalls that the cow, with little care, will keep herself clean. You may not be able to tell one bacteria from another under the microscope, but you can understand that milk as it comes from the cow, between 90 and 100 degrees, or body heat, is ideal for the multiplication of germ or bacteria life. You can cool your milk and cream at once and keep it cool. You can use your best judgment as to the easiest and best plan to do this. You can do your part in raising the standard of quality of dairy products in your state. Do it.

John Bower.

Clipping the Udder.

To the Editor:—It is not at all uncommon among dairy cows to find the udder covered with a thick growth of long hair, which may be of some protection to the udder in some respects, still from a sanitary standpoint and a comfort to the cow while she is being milked these hairs are detrimental. Under the usual farm conditions this growth of hair is commonly covered with filth and even in well-kept dairies this hair, unless kept well clipped, will collect more or less dirt and trash. In many cases, too, these hairs will persist in falling into the milk pail. To prevent occurrences such as these the



The Supremacy of the De Laval Cream Separator

Supreme in Skimming Efficiency

Over 35 years of experience and thousands of tests and contests the world over have demonstrated the De Laval to be the only thoroughly clean skimming cream separator, under all the varying actual use conditions, favorable as well as unfavorable.

Supreme in Construction

This applies to every part of the machine—to the bowl, the driving mechanism, the frame and the tinware. The De Laval Patent Protected Split-Wing Tubular Shaft Feeding Device makes possible greater capacity, cleaner skimming and a heavier cream than can be secured with any other machine.

Supreme in Durability

The De Laval is substantially built. The driving mechanism is perfectly oiled and the bowl runs at slow speed, all of which are conducive to durability and the long life of the machine. While the life of other cream separators averages from three to five years, a De Laval will last from fifteen to twenty years.

Supreme in Improvements

This has been the greatest factor in De Laval success. Not a year goes by but what some improvement is made in De Laval machines. Some of the best engineers in America and Europe are constantly experimenting and testing new devices and methods, and those which stand the test are adopted.

Supreme in Service

With its worldwide organization and with agents and representatives in almost every locality where cows are milked, no stone is left unturned by the De Laval Company to insure that every De Laval user shall get the very best and the greatest possible service from his machine.

Supreme in Satisfaction

De Laval users are satisfied users, not only when the machine is new, but during the many years of its use.

Supreme in Sales

Because they are supreme in efficiency, construction, durability, improvements, service and satisfaction, more De Laval Cream Separators are sold every year than all other makes combined.

Order your De Laval now and let it begin saving cream for you right away. Remember that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or if you don't know him, write to the nearest De Laval office as below.

THE DE LAVAL SEPARATOR CO.

165 Broadway, New York 29 E. Madison St., Chicago

50,000 BRANCHES AND LOCAL AGENCIES THE WORLD OVER

udder should be clipped closely at least twice each year, and in this way prevent the accumulation of filth and making a much better success of cleaning the udder.

Leaving these long hairs on the udder is a good way to make a bad kicking cow out of a heifer that has the making of a fine cow. When the milker clasps the teat during the milking process the long hair surrounding the upper part of the teat is included and as each stream is drawn these hairs are given a hard, vigorous pull. It is no wonder, then, that the young cow protests with a lively kick.

A common pair of clippers, such as are used on horses, is the best for clipping the hair from the cow's udder. The clipping should extend over the flank and thigh on the right side, as this will make it more easy to keep the pail clean. In the production of strictly first-class milk, the above precaution should always be observed, as well as the usual cleaning of the udders. It is certainly a cleanly custom.

W. H. U.

Nettle Hill Cow-Testing Association.

The following table gives the names and records of the cows in the association which have produced more than forty pounds of butter fat or 771 pounds of milk during the period of thirty days ending February 26, 1916:

Rock County Guernsey Men Organize.

Breeders of Guernsey cattle in Rock county were organized recently. Fifteen charter members were enrolled. The association is known as the Rock County Guernsey Breeders' Association and the following are the officers for the first year: Dr. W. A. Munn, Janesville, president; Theodore A. Clarke, Edgerton, first vice president; M. S. Kellogg, Janesville, second vice president. I. M. Erickson, Janesville, secretary, and J. A. McComb, Milton, treasurer. Any live stock breeder who uses a pure-bred Guernsey sire is eligible to membership in the association. The number of county Guernsey societies in Wisconsin is increasing. Formerly, Waukesha county was the most conspicuous for Guernsey organizations. It is planned to arrange for a summer meeting of the Rock county association. While the membership is only fifteen to start with, it is remembered that the large organization in Waukesha county began with

Build a Silo to Last a Century

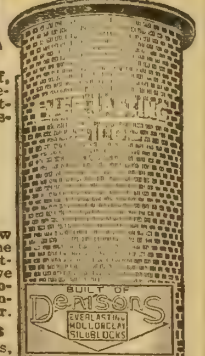
Take the same pride in your silo that you do in your registered stock. Build the kind that arouses envy and creates admiration. Have it fool-proof, fire-proof, storm-proof and decay-proof. Make it an everlasting monument to your prosperity by using

DENISON Everlasting Silo Blocks

Genuine Everlasting Hollow Tile silos cost no more than the commonest kind—but are better every way—more attractive—more serviceable—more economical—more durable—warmer in winter, cooler in summer.

Write Today For Free Plans

Don't build until you write us, giving size of silo you wish to build. We will tell you what it will cost, and how to build it. "The Denison Way." Don't delay—Write today.



Mason City Brick & Tile Co., Dept. L, Mason City, Iowa

EAGLE Safety and Service

Buy an EAGLE Ensilage Cutter first because the perfect control and EAGLE Safety Knife Head make it safe. **No danger of long delays and serious accidents** at silo filling time when hours lost mean dollars lost.

Buy an EAGLE because its non-winding, powerful-gripping feed rolls give far greater feeding capacity. Its positive roller-chain-driven blower does not clog and the whole machine is built to stand the work. In a word

EAGLE means SERVICE

Long Feed Table, large feed opening, four knives, four edged cutting bar, safety cylinder head, safety reverse lever, powerful non-clogging blower and easy adjustment for different length cuts. No belt slippage.

You will find many other special features in these clean built, clean cutting, compact EAGLE Cutters.

Bumper Grain Crops
Good Markets — High Prices

Prizes Awarded to Western Canada for Wheat, Oats, Barley, Alfalfa and Grasses

The winnings of Western Canada at the Soil Products Exposition at Denver were easily made. The list comprised Wheat, Oats, Barley and Grasses, the most important being the prizes for Wheat and Oats and sweep stake on Alfalfa.

No less important than the splendid quality of Western Canada's wheat and other grains, is the excellence of the cattle fed and fattened on the grasses of that country. A recent shipment of cattle to Chicago topped the market in that city for quality and price.

Western Canada produced in 1915 one-third as much wheat as all of the United States, or over 300,000,000 bushels.

Canada in proportion to population has a greater exportable surplus of wheat this year than any country in the world, and at present prices you can figure out the revenue for the producer. In Western Canada you will find good markets, splendid schools, exceptional social conditions, perfect climate, and other great attractions. **There is no war tax on land and no conscription.**

Send for illustrated pamphlet and ask for reduced railway rates, information as to best locations, etc. Address

eight charter members. One of the plans on foot in Rock county is to have a Rock county exhibit of Guernsey cattle and to take this exhibit to a number of the county and district fairs.

Have Cows Freshen in the Fall.

To the Editor:—The old practice of having cows freshen in the spring and go dry in the fall is giving way to better methods. It goes without argument that fall is the best time to have the cows freshen, to keep up the milk flow. A cow will naturally begin to fall off in milk production when six to seven months in lactation. A cow that comes in fresh in the fall will reach this stage when pasture grasses are good. This will counteract the natural tendency and through the summer months she will just about hold her own with the cow that freshens in the spring.

A cow should always be permitted to go dry two months before calving. Say we let her dry up in July or August. Isn't this the time that the milk supply would naturally slacken up on account of the flies, heat, short pastures, etc? Some dairymen claim that it is better to have the whole herd to freshen in the fall or early winter.

It is not best to feed the cow heavily on grains previous to calving. They will not require a heavy grain ration if they freshen in the fall, owing to the pasture grasses and green feeds at hand.

The fall calf usually gets a better start in the world than the one that arrives in the spring. The farmer will have more time to take care of the calves in winter than summer; the fall pastures are coming on, furnishing the cow an abundance of good, green stuff that produces a large milk flow. The fall pastures are more nourishing than the spring grasses, owing to the fact that they do not contain so much water. There are no flies or heat to bother either the cow or calf, and if dropped early enough the calf will get a good start and learn to eat well before cold weather sets in.

Milk products are much easier taken care of in winter than summer and milk and butter prices are at their best at this time.

The cow and calf will have to be carefully housed during the cold months. Keeping them housed in muddy, filthy stalls that are full of drafts and feeding them just anything that happens to be on hand will not work well with either the cow or calf. They must have good attention if profitable returns are expected.

E. E. R.

How I Raised My Calf.

[Editor's Note.—The following article by J. C. Robinson, of Evansville, Wisconsin, was written to encourage the Rock county boys who have engaged in the calf-raising contest.]

Now you boys who have selected your calves, have them entered in the Baby Beef Contest and have your work started, perhaps some of you have been wondering how you will feed them.

At the stockyards they say that "very few feeders can turn out a fat yearling." Can't we change that idea, boys? In attempting to do this remember that we want you to get all the help you can from your father or anyone else. That's the only way that anyone can really learn, because no one knows all about live stock, and especially "baby beef" production.

Definite rules for feeding baby beeves cannot be given, as every successful feeder has a little different method. But we will try to give you the general plan which most of these men follow and you can make changes to fit your conditions. However, there is one rule upon which all feeders are agreed. That is, "do not lose the calf fat," and it means that you must keep the calf "coming" all the time, especially during the weaning period. That's the most important time in the life of a baby beef.

Most of you will be feeding a fall calf, and the following plan will possibly be of aid to you.

Fall calves usually come in September or October. Most feeders say that milk is necessary for profitable baby beef production, and so they let the calves run with their mothers or turn them to their mothers twice a day. Allow them to eat grain as soon as they will take it. Keep the cows away while they are eating; build a "creep" for the calves or turn them in a separate lot. Corn and oats, mixed half and half by measure will make a good mixture to start them on. Gradually increase the corn and decrease the oats until at the end of eigth or nine weeks they are getting no oats at all. Add a little oil meal as you take out the oats until, when they are on full feed they are getting twenty pounds of oil meal to eighty pounds of corn. A small amount of bran with this mixture, say ten pounds, improves it, to my notion. Cottonseed meal can be substituted for oil meal, although many feeders say that oil meal is better while the calves are nursing. Give them plenty of good clover, alfalfa or mixed hay. When weaning time comes they will scarcely notice that the milk supply has stopped. I would keep fall calves off pasture entirely, feeding them in a darkened shed or stall. Of course, they will want some exercise, but not much. A little corn silage, if you have it, or green corn will be relished by them. They should be on full feed by July or August and should be eating about two pounds of grain for every hundred pounds of live weight. They should weigh from 400 to 600 pounds at the start. When the calves are twelve to fourteen months old they should be in prime condition and ready for the Christmas market which is usually the highest of the year for cattle of quality and finish.

Spring calves dropped in March and April are usually finished for the May and June markets which are generally good, since few prime cattle are for sale at this time. Most men allow the calves to run with their dams on grass, nursing until the cows are dry. Others keep the calves in a well-bedded, darkened stable, allowing them to suck night and morning, thus avoiding much fly trouble. During December and January they should be on full feed so as to get to market during May and June.

Three thousand boy scouts received 4,000 mulberry trees from the state game commissioner, John M. Phillips, of Carrick, Pa., to plant. This species was selected by Mr. Phillips because the birds, which destroy many bugs and insects in an orchard, prefer mulberries and will not destroy more desirable fruits when mulberries are obtainable.

Separator running at full speed. Loss of butter 1.75 pounds

Speed reduced 10 revolutions. Loss of butter 7.28 pounds

Speed reduced 20 revolutions. Loss of butter 12.74 pounds

Which pile did *you* lose?

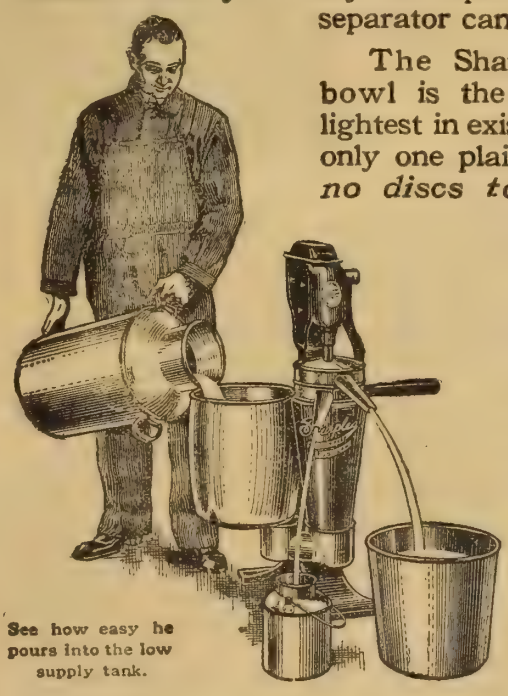
These figures from the Purdue Experiment Station Bulletin No. 116, show the loss in butter resulting from not turning a fixed-feed separator at exactly the speed stamped on the crank.

And investigations showed that 19 out of every 20 separator operators thruout the country turned their machines too slow much of the time.

THE NEW SHARPLES SUCTION-FEED

is the *only* separator made which *will not lose cream at varying speeds.* The wonderful "Suction-feed" always feeds the milk to the bowl in exact proportion to the separating force being generated. At 45 revolutions it *skims clean;* at 55 it *skims clean* and at 35 revolutions it *skims equally clean.* No other separator can do it.

No matter how you turn the New Sharples you always get *even thickness* cream. Just set the cream screw at the desired thickness and it will come out *velvety* and *even*—no matter how you vary the speed. No other separator can do it.



See how easy he pours into the low supply tank.

The Sharples Tubular bowl is the simplest and lightest in existence. It has only one plain part in it—*no discs to wash* and bother with.

All these and many other features explain why the New Sharples is the profitable separator for *you* to use. It is described in detail in catalog *"Velvet" for Dairymen.* Send for your copy today. Write Dept. 44.

Swat the Fly Poison!

With the approach of the warm spring days will come the fly nuisance, and, while we are just as enthusiastic over the "swat the fly" program as anyone, we want, before ever a fly appears, to sound a warning as to the manner of "swatting."

We recommend screens, clean yards, barns and outhouses, and the prompt burning or burying of all waste matter that is apt to attract these pests.

We condemn fly poisons.

Did you know that fly poisons were made of arsenic? And did you know what a toll these poisonous fly-killers claim every year in little lives—lives of the wee folks who don't know any better than to eat or drink anything their small hands can reach? The cases on record vary anywhere from twenty-five to fifty a year, and that probably is not the true number. The symptoms of arsenical poisoning are so similar to those of cholera infantum that it is quite likely there have been many more cases than have been reported, because the children generally are too small to tell what they have done, and if they are not seen taking the poison, cholera infantum may easily be inferred from the nature of the illness.

Do not buy the stuff and rest serenely content that you have put it out of reach of little hands. Mothers have done that before, only to find, when it was too late, that in some unaccountable way the fly killer had fallen to the floor, or the drawer in which it was hidden was left open.

For two years the Child Betterment Bureau has waged war on this evil. Through the efforts of this organization a bill was introduced and passed in the Michigan legislature regulating the manufacture and sale of poisonous fly killers. Legislators of other states should and eventually will follow this good example. In the meantime each individual can do his part by barring this dangerous substance from the house and providing for the annihilation of the fly in a more safe and sane manner—screens and cleanliness.

Look to Your Ice Box.

The refrigerator and its care are important factors in the health of the family.

The lining of the refrigerator should be smooth and free from seams or visible soldering. The corners should be rounded. As to the material used, galvanized iron is almost impossible to keep clean. Perhaps you have noticed a white powder that collects on a zinc lining. This is a chemical poison—oxide of zinc—and therefore to be avoided. White enamel is easily cleaned, but it scales if it is put on over a zinc base. Tile and glass are easily cleaned, also, and look nice, but they crack and break easily. Porcelain does none of these things and is altogether the most satisfactory lining to be had.

There are "friendly" and "unfriendly" bacteria which affect food, and there is a deal of difference between the two when shut up in the family ice box. One changes the taste without creating harmful conditions; the other creates ptomaines and a whole family of ills. If you are not quite sure which is which, you'd better ask. It will be worth your while, as the housekeeper and the guardian of the family health. And be sure your ice supply is pure.

Roses.

To the Editor:—"If you would grow roses you must have love in your heart." Someone, sometime, somewhere, said those words, though who I cannot remember. I do know though that all the love you bear in your heart for a rose will not bring it to perfection unless you also have a streak of stick-to-itive-ness which will cause you to give it the necessary attention.

One of the most necessary requirements is cultivation, another fertilization, and with them, a hand that ruthlessly pushes aside all tender feelings you may entertain for the beautiful long new growth which springs up from the effects of the cultivation, etc.

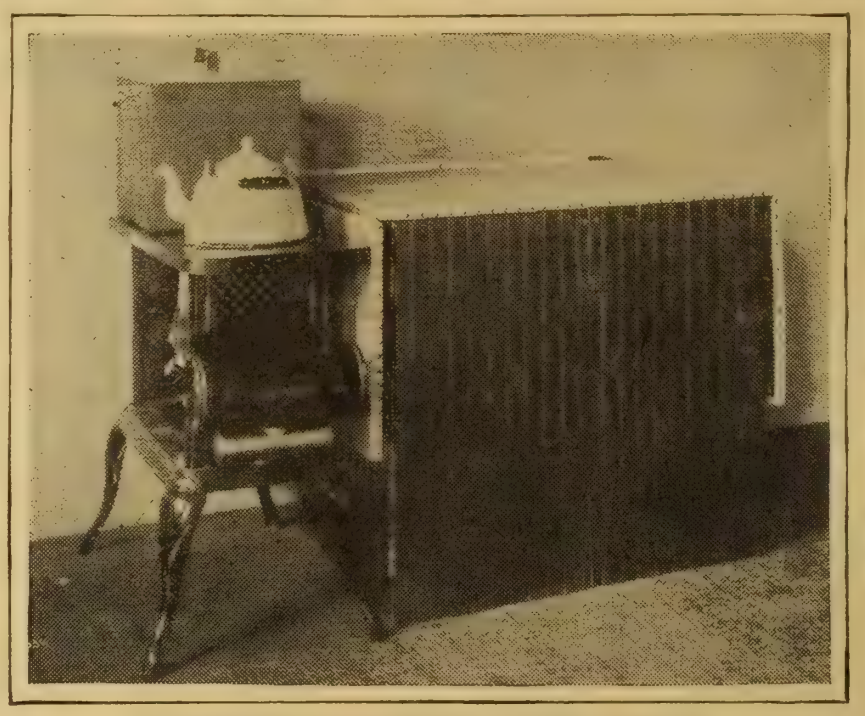
The nipping back of these branches brings the flowers in abundance in their season.

The easiest way to fertilize a rose is to take a No. 3 old tin can, punch a few holes in the bottom, fill it half full of cow manure, make a slight depression near the bush, set the can in this depression and keep it filled with water as it seeps away day by day.

Roses are great feeders. You who are fortunate enough to live on a farm where you are bound to have once in awhile a chicken which gets tired of living, will find no place where you can recover a little of the loss from its death as quickly as you will if you bury your dead beneath the shade of the rose bush.

Incidentally you would be surprised at what these cans of fertilizers will do for tomato plants. Try it.

Minnie Hatton Jewell.



A SUGGESTION FOR SUMMER KITCHEN COMFORT.

Transplanting.

To the Editor:—To transplant a seedling so it will not droop I think is a great accomplishment, and I have been able to do that since I have followed the method I will describe.

I take an old bread pan about two inches deep, and punch a few holes in the bottom. Then I take old post cards or stiff covers off magazines, etc., and cut them into strips as long as I think I need them and about two inches in height, depending on the kind of seed I am planting. Some are not more than two inches long and some as much as four. I tie them in a circle with thread, then place them side by side in the pan, filling it full. Then I fill each little circle with good loam, pressing it down well and having it filled to very near the top. In each of these card board circles I plant two or three seeds.

To water, I spread a loose-meshed cloth over the top and pour water on it till the earth is damp enough, After the first damping I pour a little with a spoon in each circle unless I keep the pan where I do not care if it does drip water, and then I pour in the pan, but never pour in the circle because of washing the dirt from the seeds or burying them too deep, if small.

When they have started enough to determine the strongest seedling I pull out the two weaker ones or, if only two seedlings, I pull only one, leaving just one seedling in a circle.

To transplant, I take the pan to the garden or flower bed where I am going to put the plants for the rest of the season, take out a circle at a time, snip the thread, and push into the loose dirt. If the leaves on the seedling are small enough I pull the cardboard circle up. If not, I let it remain; it does no harm anyway. My seeds, started this way and so transplanted, never know they have been removed from the place of their birth.

When I start seeds in the hotbed by this method I put the circles right into the dirt without a pan, but, of course, the card board is dirtier to handle when you transplant, while these in the pan are clean. It is also very necessary that you do not let them dry out in the house.

J. A. J.

Rich Soil For Roses.

To the Editor:—In a recent issue I noticed a request for information about roses. I find them very easy to raise and will give my experience.

Roses require a very rich soil, as they are heavy feeders. The latter part of May or the first of June is the best time to plant new bushes in the open. If well-rotted stable manure can be had, mix it generously with the soil before setting the plants, and press the soil firmly around the roots. It is well to remember that the more roses you cut (I mean the perpetual bloomers, of course) the more roses the plant will produce. If the flowers are cut with long stems and the blossom cut off the stem as soon as it begins to fade, and the stem then planted with a glass jar turned over it, many times the stems will grow. Do not remove the jar until the plant is well started.

Where I live, in Iowa, the winters are so severe that I always start the new plants in boxes or pots that they may be brought into the house during the winter. If they are kept well watered and in a sunny window they will be blooming by spring.

If roses are to be left out all winter it is best to give them some protection in this severe climate. This may be fallen leaves or straw, etc.

For successful growing of climbing roses be very generous with the fertilizer. This point cannot be too strongly emphasized if you want them to cover a porch in one season. After the plant is through blooming in June or early July, cut out all the canes that have bloomed this season. It is the new canes that will bloom next summer. If the ground has been well fertilized the new canes will have become as large as those cut out by September.

Mrs. Mabel Schlichter.

Care of Cured Meat.

Do not sprinkle meat with borax to keep off the skippers, but wrap it thoroughly and hang in an airy place where the mice cannot get at it. The best method of wrapping meat for keeping over summer is to enclose first in a cloth flour sack and then in a paper flour sack; tie the ends of the sack tight enough so that flies cannot get in around the string.

Pieces of meat should not touch each other or they will mold considerably. In damp, muggy weather cured meat will mold in spite of all you can do. The mold, however, is only on the surface and can easily be removed. Do not try to hold the shoul ders until fall, as the mold penetrates into the fatty tissue of the shoulder and there is considerable waste in removing this moldy part. The ham muscle is more compact and the loss in removing the moldy part is very small.

If the smokehouse is dark and fly-tight the meat can be kept through the summer without wrapping.—[P. F. Trowbridge, Mo. Agri. Exp. Sta.

Wants to Know How to Wash Sweater.

To the Editor:—I wish some of the readers would tell me how to wash a very fine white wool sweater for a baby. The sweater and cap have pink and blue trimming and I want to know how to wash or clean them so they will look like new and the color won't fade. It is a very fine sweater and I don't like to start at it until I know that I am going to do it right. Does anyone know of a good way? Y. Z.

Will Mrs. F. E. T. Write Again?

To the Editor:—I wish Mrs. F. E. T. would write to the Home Department again and tell us how she makes sofa pillows out of silk and velvet, and also send a diagram of the pattern she uses. I have a great many pieces I would like to use up and I would like to get some new patterns.

E. M. S.

[Note.—We have another request for Mrs. F. E. T. to tell how she made porch pillows from gunny sacks. Most of our readers, we think, would be interested in another letter from Mrs. F. E. T., telling how she makes her pillows and sending a pattern so that it might be copied.—The Editor.]

Crocheted Cap.

This cap requires two spools of crochet or knitting silk and should be made with a No. 7 steel hook.

Chain six and join to form a ring.

First Row—Thirty double crochet in the ring, joining last to the first.

Second Row—Chain five, over twice, take a stitch in first double crochet, over and through two, over and through two, over twice, take a stitch in next double crochet (over and through two), three times, over twice, take a stitch in next double crochet, work the stitches off two at a time, single crochet around the end of the point. Repeat the point until ten are made with five chain between.

Third Row—Five double crochet in

each five chain and one double crochet in tip of the point.

Fourth Row—Like the second row, with three chain instead of five.

Fifth Row—Three double crochet in three chain and one double crochet in the point.

Sixth Row—Like the fourth.

Seventh Row—Like the fifth.

Eighth Row—Chain four, four double crochet in four double crochet, single crochet in the next, chain four, four double crochet in next four double crochet, single crochet in next and repeat to end of row, single crochet in four chain, turn.

Ninth Row—Chain four, four double

CROCHETED HOOD FOR BABY.

crochet in four chain, single crochet in next four chain, and repeat to end of row. Turn at end of each row.

Tenth Row—Leave six shells at neck and finish as ninth row.

Repeat tenth row eleven times, then make two more rows all around the cap.

First Row of Edge—Point like second row between two shells, chain one, double crochet in second double crochet of shell, chain one, point between next two shells and repeat around.

Second Row—Shell of (two chain, double crochet, picot, chain one, double crochet, picot, chain one, double crochet, picot, chain one, double crochet, picot, chain one, double crochet, chain two) in each point and single crochet in the double crochet between the points.

Corn Sirup in Canning Operations

The value of corn sirup in canning and preserving fruit and in jelly making is so well established that

ELLEN JOHNSON.
Daughter of Mr. and Mrs. A. A. Johnson.

many domestic science schools are recommending a blending of this product with sugar to obtain the best results. By its use the natural flavor of the fruit is much more apparent and a heavy sirup is obtained without the cloying sweetness of the all-sugar sirup. Corn sirup, blended with sugar, not only prevents fermentation of the fruit but also does away with the crystallization of the sirup which so often occurs in jellies and jams.

For canning fruit the following table may be of use to those who propose trying corn sirup for the first time:

Apples—sour, 5 lbs.; sugar, 1½ lbs.; corn sirup, ½ lb.; water, 3 pts.; boil 15 to 20 min.

Apricots, 5 lbs.; sugar, 1¼ lbs.; corn sirup, ⅜ lb.; water, 1 pt.; boil 10 to 15 min.

Berries, 5 lbs.; sugar, 1½ lbs.; corn sirup, ½ lb.; water, 1 cup; boil 15 min. slow.

Cherries—sour, 5 lbs.; sugar, 2½ lbs.; corn sirup, ¾ lb.; water, 1½ pts.; boil 15 min.

Cherries—sweet, 5 lbs.; sugar, 1½ lbs.; corn sirup, ⅜ lb.; water, 1½ pts.; boil 15 min.

Currants, 5 lbs.; sugar, 3 lbs.; corn sirup, 1 lb.; water, 1 pt.; boil 15 min.

Green gooseberries, 5 lbs.; sugar, 3 lbs.; corn sirup, 1 lb.; water, 1 pt., boil 15 min.

Peaches, 5 lbs.; sugar, 1¼ lbs.; corn sirup, ⅜ lb.; water, 1 pt.; boil 10 to 15 min.

Pears, 5 lbs.; sugar, 1¼ lbs.; corn sirup, ⅜ lb.; water, 1½ pts.; boil 15 min.

Pineapples, 5 lbs.; sugar, 1¼ lbs.; corn sirup, ⅜ lb.; water, 1½ pts.; boil 20 min.

Plums, 5 lbs.; sugar, 2 lbs.; corn sirup, ¾ lb.; water, 1 pt.; boil 20 min.

Prunes, 5 lbs.; sugar, 1½ lbs.; corn sirup, ½ lb.; water, 1 pt.; boil 20 min.

Quinces, 5 lbs.; sugar, 1½ lbs.; corn sirup, ½ lb.; water, 3 pts.; boil 20 to 30 min.

Arithmetic of the Mixing Bowl.

There are a number of fixed proportions used in all recipes, and the following are standard:

One-half as much liquid as flour for muffin and cake batters.

One-third as much liquid as flour for soft doughs, as for biscuit.

One-fourth as much liquid as flour for stiff doughs, as for bread.

One-third to one-half as much butter as sugar for all butter cakes.

One to one and a half teaspoonfuls of baking powder to a cupful of flour for batters or doughs.

One-third as much shortening as flour for pastry.

One teaspoonful of soda to one pint of sour milk.

THE YOUNG FOLKS

All letters from boys and girls to this department should be sent to office of The Wisconsin Farmer, Madison, Wisconsin.

Likes to Play Ball.

Dear Young Folks:—I enjoy reading your stories very much. I am ten years old and am in the fifth grade at school. I like to go to school, but sometimes I have to stay home and help papa and mamma. We have domestic science at our school and we cook every Thursday. There are four of us boys and we take turns with the girls because they know more about cooking than we do. We also sew every day just before noon.

We often play ball at our school, too, and I often make a home run. I like to be a batter and bat the ball over the fence. I like to be pitcher when the other boys bat me a fly and I catch it and get them out. It's fun for me to get the bigger boys out. I think it is good exercise to play ball. When I was little I used to like to play ball, but every time I'd get up to bat I'd get out. I didn't like that very well, but afterward I began to think the best way to learn was to keep on trying and now I can bat a long ways.

—Lawrence.

Try This One, Girls.

Dear Young Folks:—I certainly enjoy reading your letters and the stories on the Young Folk's page. We live on a farm 103 acres and we have to go two and one-half miles to school. I am twelve years old and mend my own clothes and do nearly all the cake making that is done at our house. Here is one that I make. It is devil's food cake. I take one egg, one-half cup of sugar, one-half cup of sweet milk, one-third cup of grated, unsweetened chocolate; cook until thickened, then let cool. Cream one cup of sugar with one-half cup of butter. Add two eggs, beaten separately, one-half cup of sweet milk, two cups of flour, one-half teaspoonful of vanilla and one-half teaspoonful of soda dissolved in the milk. Mix all thoroughly and add the chocolate paste. Beat well, bake

On every outing—

KODAK

Let picture taking add to the delights of country life. Every day in the open, every picnic party is made merrier if you Kodak—and afterwards comes the pleasure in the pictures themselves, and picture taking is less expensive than you think.

Illustrated catalogue of Kodaks and Brownies, free at your dealer's, or by mail.

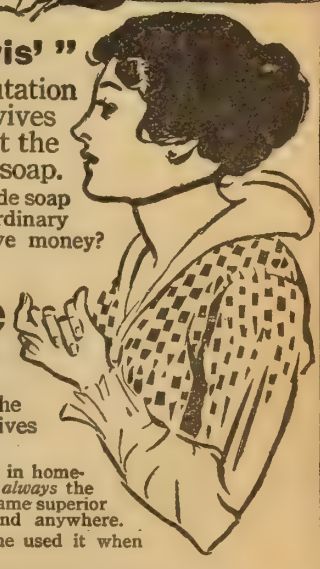
EASTMAN KODAK CO., 469 State St., ROCHESTER, N. Y.

The Quaker Says:—

"Put Thy Faith in Lewis'"

He knows that the lye with the reputation is the lye that discriminating housewives should select, for general cleaning about the house, for water softening, for making soap.

About making soap—do you realize that home-made soap is easy to make and an extraordinary economy? Would you like to save money? Soap made at home with



Lewis' Lye

The Standard for More Than Half a Century

costs less than half as much as the cheapest commercial soaps and it gives perfect cleansing results.

Lewis' Lye entirely saponifies the grease in home-made soap. It *always* does it because it is *always* the same. Every can of Lewis' Lye is of the same superior quality as every other can—always and anywhere.

Ask your mother. The chances are she used it when she was a girl and does yet.

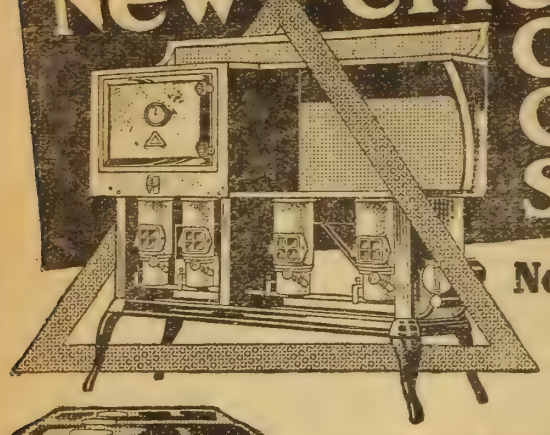
New Perfection Oil Cook Stoves



No Odor No Smoke No Ashes

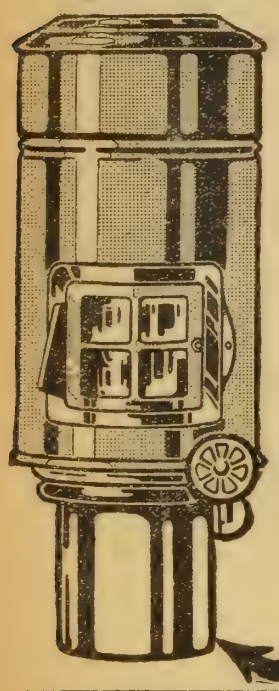
Truly that is the housewife's idea of paradise. And those features are only a few of the many advantages of cooking with *New Perfection Oil Cook Stoves.*

No longer is it necessary for you to suffer from the intense heat of the wood or coal burning range long before you are ready to begin operations.

Just touch a match to the wick and your fire is ready when you want it.

You can have a slow fire or an exceedingly hot one; just as you wish.

You don't have to watch it either. The flame will not creep up or diminish.



The Long Blue Chimney

is the key to the efficiency of the New Perfection Oil Cook Stoves.

The flame never touches the bottom of the utensils. Every atom of oil is burned and converted into usable heat in the long blue chimney. No waste—no dirt—no odor. It makes your summer cooking easy.

Write for booklet giving full description and prices of the various types.

If none of the above combinations suit you, you can make up your own club of papers in the following way: First select The Wisconsin Farmer and figure it at $1.00 per year. Then select any of the papers or magazines listed above and figure them at half their regular subscription price as indicated above, choosing whatever papers or magazines that appeal to you. As an example, suppose you should want The Wisconsin Farmer, Kansas City Weekly Star, Woman's World and People's Home Journal. You would figure The Wisconsin Farmer in the combination at $1.00; then you would add up the regular subscription price of the other three papers, which amounts to $1.10. Half of that amount equals 55 cents. Add this to the regular price of The Wisconsin Farmer, which is $1.00, and you would have a total of $1.55, which would be the rate for The Wisconsin Farmer, Kansas City Weekly Star, Woman's World and People's Home Journal.

If you wish to subscribe for any papers or magazines not listed in any of the above offers, write to us for special rates. Send all orders to Club Dept., The Wisconsin Farmer, Madison, Wis.

in layers and put together with white frosting.

I have five sisters (two of them are twins) and we are all happy together.
—Margaret.

School Better Than Vacation.

Dear Young Folks:—I am a little farmer girl. We live on grandpa's farm. I am nine years old and my little sister is six. Our birthdays are on the same day, the 24th of March.

We walk one mile to school every day. We would rather go to school than to have vacation. After school our chores are to carry in the wood, hunt the eggs and get supper. Sometimes when we get lazy we skip down to grandma's, but mamma usually calls us back.

We have a pet bull dog which we call Beaute. We think he is a very fine dog.

I love flowers and my favorites are roses, pansies and lilies-of-the-valley. I have a little hotbed of cabbage plants. I think when I grow up I shall like gardening. —Wenona.

A Captive Crane.

Dear Young Folks:—I live on a 180-acre farm and I like the country very much. I have a mile and a half to walk to school and am in the eighth grade. I expect to graduate from country school next year.

Last night my brother came home from hunting with a crane which he had wounded in the wing. My sister Mildred and I took it and put it in the

PALS.

cob house. We bandaged the wing up and gave the crane something to eat and drink. We expect to tame it and call it Dickie Daddles. —Ruth.

Mabel and Sister Are Partners.

Dear Young Folks:—I am a little girl nine years old and will be ten the 19th of June. We live on a farm and have two geese, quite a few hens and roosters, besides horses, cattle, pigs, some little calves and two little colts. We have sixteen little chickens already. This morning I went to the henhouse with mamma and fed the two old hens that have the chickens. I fed them out of my hand. One old hen has eleven chickens and the other five.

I can cook a little, but mamma has to help me with it. I can also tat and crochet a little.

My sister and I have a calf together. We paid papa $11 for it. Each of us gave $5.50. I had a pig, too. I paid $2 for it and when I sold it I gave papa $2 for feed and pasture and then I had $13.92 left from it.

I go to school with my sister and brother. I am in the fourth grade and I like to go to school. —Mabel.

Robin Redbreast.

Little Robin Redbreast sat upon a tree,
Up went pussy cat, and down went he;
Down came pussy cat, and away Robin ran;
Said little Robin Redbreast, "Catch me if you can."

Little Robin Redbreast jumped upon a wall,
Pussy cat jumped after him, and almost got a fall;
Little Robin chirped and sang, and what did pussy say?
Pussy cat said naught but "Mew," and Robin flew away. —Anon.

International Sunday School Lesson.

Lesson for May 7, 1916.

(By E. O. SELLERS, Acting Director of Sunday School Course.)

The Missionaries of Antioch.

LESSON TEXT—Acts 11:19-30; 12:25; 13:12.

GOLDEN TEXT—Go ye, therefore, and make disciples of all nations—Matthew 28:19.

An interesting introduction to this lesson would be to review the outstanding features of the life of Barnabas up to this time. His attractive character, introduction and associations with Paul are full of rich and suggestive lessons. Following Peter's deliverance of last Sunday's lesson we read of the end of the vile Herod (12:20-25). The origin of this Antioch church was perhaps in A. D. 40, following the dispersion after the death of Stephen (11:19-26). These converts gave proof of their new love by ministering to the brethren in Jerusalem (11:27-30).

I. A Great Church (11:19-30). (1) Their testimony. This new sect, "Christians" (v. 26) made a deep impression upon this great city though as yet its testimony was to the Jews only (v. 19). The first evangelists to this city from the home of Judeaism at the outset, however, spake to Gentile Greeks. (a) They "spake the word" (v. 19), as travelers and fugatives they carried the message wherever they journeyed. (b) "They prached Jesus," the only message that will reach and stir an entire city. (c) They did it in a conversational way (v. 20 R. V.). (2) The workers (3:1). It is an amazing array of names mentioned as one of the results of this Antioch revival. Step by step God has widened the sphere of activities of those who accepted the gospel, and with every step the stamp of divine approval was seen (11:21). Those who "turned unto the Lord" not only believed but gave evidence of repentance and under the leadership of Barnabas, who had brought Saul with him from Tarsus (v. 25), large numbers were assembled and taught (v. 26). This ministry of teaching is a commendable type of evangelism and while the term "Christian" is applied to these followers of Jesus (not of Barnabas and Saul), it was doubtless first applied in derision, and it has become the accepted and glorious title (often abused or confused with Christendom) of those who follow our Lord.

II. A Great Commission (13:1-3). The separation which took place after Barnabas and Saul had resided in the city for a year's time (11:26), and while they were meeting with such outward success reminds us of the way the spirit separates Philip from his work in Samaria (8:6, 26, 27). The Holy Spirit knew what was best for these followers of Jesus as the results demonstrated. Among the great leaders the Spirit separated two for this particular task, and the quietness with which it was done as suggested by the text, is in marked contrast with most of our modern plans for "advanced steps." No "dollar dinner" or committee luncheons and meetings. This duty was presented: (1) While in the discharge of their regular duties, "as they ministered" (v. 2). Just the form of this ministry is not accurately stated, but it included fasting and prayer (v. 3): and it "was to the Lord." There are plenty today who can do "church work," but far too few who can minister to the Lord (not to people) and who can by fasting and prayers know what the mind of the Spirit is relative to any advance steps needful in the church. (2) Under the Spirit's direction. Just how the Spirit spoke to this people we do not know nor much care, but his message was unmistakable, whether audible or in the deep recesses of their hearts. (3) It came while they prayed. An overly filled stomach is apt to divert a Spirit-filled mind. But an attitude of prayer is the only one which can render us susceptible to the Spirit's voice. He is ever ready to speak and if we supply the open heart and the ready mind there will be no vague, uncertain impulse such as men often call "the Spirit's voice;" rather a definite task.

III. A Glorious Conquest (v. 4-12). (1) The journey (v. 4). It was but natural for the leader of this expedi-

tion to direct his steps first to his home (4:36). If our testimony will not receive a hearing at home it is not of any great value. (2) The work (v. 5). They followed the same plan as before, entered the synagogues where teaching and discussion were the order of service and, to the Jews, gave the "word of God" (Matt. 5:17). Are we able to thus teach the word, how Jesus "fulfilled" and what the result is in that he did fulfill "all righteousness?" (3) The resistance (v. 6-8). Bar-Jesus, or "Elymas, the sorcerer," must not be confused with our modern necromancers or sleight-of-hand artists. He was a leading scientist of his time and his position in the Roman deputy's household is significant. He readily saw that for the deputy to hear the gospel would destroy his power and influence (v. 8). Paul, now first so-called (v. 9), knew the blight of blindness, physical and spiritual, and caused this man, temporarily (v. 11) to be smitten even as he had been (9:8, 17, 18). The deputy had desired to "hear" (v. 7) the Word.

OUR FASHION DEPARTMENT.

ALL PATTERNS, 10 Cents Each.

THIS department is prepared especially for The Wisconsin Farmer. We can supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10 cents each, postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering, all you have to do is to write your name and address plainly, tell us the correct number and size of each pattern you want and inclose 10 cents for each number. We agree to fill all orders promptly and guarantee safe delivery.

CATALOG OF SPRING AND SUMMER FASHIONS.

Send 10 cents in silver or stamps for our up-to-date 1916 large spring and summer catalog, containing over 400 designs of ladies', misses' and children's patterns, as well as the latest embroidery designs, also a concise and comprehensive article on dressmaking, giving valuable hints to the home dressmaker. Address all orders for patterns and catalogs to THE WISCONSIN FARMER, MADISON, WISCONSIN.

1366—Ladies' house dress with reversible fronts, with or without collar, with sleeve in either of two lengths and with cap. The pattern is cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. The cap is cut in one size only, medium. The pattern for the dress requires 7 yards of 36-inch material for a medium size. The cap requires ¾ yard of 27-inch material.

1712—Girls' dress. A new and becoming model, suitable for serge, voile, repp, mohair, gabardine, poplin, taffeta, gingham or chambray. The pattern is cut in four sizes: 8, 10, 12 and 14 years. It requires 3⅜ yards of 44-inch material for a 12-year size.

1422—Girls' overblouse dress with guimpe. The pattern is cut in four sizes: 6, 8, 10 and 12 years. It requires 1½ yards of 27-inch material for the guimpe for an 8-year size, with 3½ yards of 36-inch material for the dress.

1715—Ladies' apron, with or without sleeve. The pattern is cut in three sizes: Small, medium and large. It requires 6¾ yards of 36-inch material for a medium size, with sleeves, without sleeves, 6 yards.

1696—Boys' blouse suit with shield. The pattern is cut in four sizes: 3, 4, 5 and 6 years. It requires 3 yards of 44-inch material for a 4-year size.

1702—A dainty frock for mother's girl. The pattern is cut in four sizes: 6, 8, 10 and 12 years. It requires 1⅜ yards of 27-inch material for the guimpe, and 3⅜ yards for the dress, for an 8-year size.

1693—Dress with or without peplum, with sleeve in either of two lengths for misses and small women. The pattern is cut in three sizes: 16, 18 and 20 years. It requires 6½ yards of 36-inch material for an 18-year size.

1397—Girls' dress with sleeves in either of two lengths. The pattern is cut in four sizes: 2, 4, 6 and 8 years. It requires 3 yards of 44-inch material for a 6-year size.

New Use For Onions.

The well-known offensive odor of the onion has suggested to some enterprising gardeners that it be turned into an asset, using it in defensive work against insects. A multitude of tests show that nearly all insects are averse to the onion. They appear to have a keen sense of smell and not only refuse to eat it but will not haunt the neighborhood where they smell it.

It is easy to see how this fact can be utilized. You have only to plant the onions with the other vegetables which you wish to protect. An Arkansas peach grower claims to have perfectly controlled the borer by planting winter onions near his trees. It is probable that this variety of the onion is the best to use for this purpose, because of its intense strength and odor. Those who have tried it claim that planting the onion in the hills of melons, cucumbers and squashes will discourage the yellow beetle and save the vines. This method of fighting is so easy that it is worth a thorough test.

Tomato vines have been recommended for this same purpose and it is very likely that their odor will disgust any self-respecting bug, but the difficulty is to get the tomato big enough to use at the time the bugs appear.

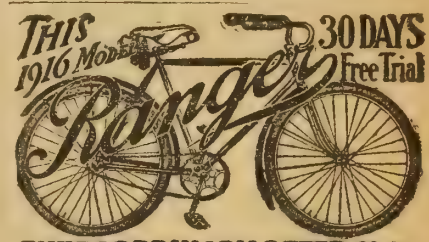
We suggest that gardeners try, say three sets per hill, of the winter onion for all those tender vines which the yellow bug eats. If you cannot easily get that sort of onion use the sets of other varieties and about the time the bugs are expected crush some of the onion leaves. By doing this you can liberate the odor, making it strong enough for all reasonable use.

The "enlistment" of dogs in the hospital corps of the United States army is assured if legislation recommended by Surgeon Gen. William C. Gorgas is passed by congress. General Gorgas appeared before the house military affairs committee to urge the enactment of a measure permitting the feeding of the dogs from the food stores of the army. The value of the work of dogs in hunting out the wounded on the battle fields already has been recognized by European nations. The German army is using 6,000 of the animals in its hospital service.

BEAUTIFUL EMBROIDERED SHIRTWAIST

For only $1.50

This dainty pattern we have priced especially low as a trial order for new customers. Of fine sheer batiste; is effectively embroidered in French blue dots with scallops and smaller dots in white. This waist represents the highest perfection in the art of embroidering, and **is imported direct by us from Switzerland** and is not on sale in any store in the United States. Thereby in sending us your order you will be assured of an individual style combined with charming simplicity. The waist may be made up in the style shown or in any other style you desire, either high or low collar, long or short sleeves, open front or back. Send for this waist today, and you will secure the best value you ever had. We can furnish it in white embroidered in French blue and white or embroidered in all white. **Our stock is limited, so send us your order at once. EMBROIDERY HOUSE, DEPT. P. F. 60 W. Washington St. - Chicago, Ill.**



EXTRAORDINARY OFFER—30 days a month's free trial on this finest of bicycles—the "Ranger." We will ship it to you on approval, *freight prepaid*—without a cent deposit in advance. This offer *absolutely genuine.*

WRITE TODAY for our big catalog showing our full line of bicycles for men and women, boys and girls at *prices never before equaled* for like quality. It is a cyclopedia of bicycles, sundries and useful bicycle information. **It's free.**

TIRES, COASTER-BRAKE rear wheels, inner tubes, lamps, cyclometers, equipment and parts for all bicycles **at half usual prices.** A limited number of second-hand bicycles taken in trade will be closed out at once, at **$3** to **$8** each.

RIDER AGENTS wanted in each town to ride and exhibit a sample 1916 model **Ranger** furnished by us.

It Costs You Nothing to learn what we offer and how we can do it. You will be astonished and convinced. **Do not buy a bicycle, tires or sundries until you get our catalog and new special offers. Write today.**

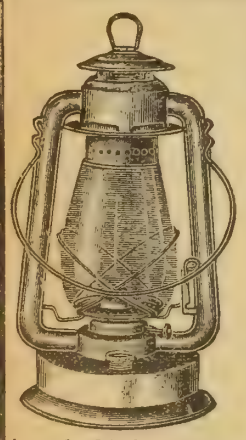
SAFETY
STORM BLAST
LANTERN FREE



This Safety Lantern cannot catch fire or explode. It is absolutely safe at all times and on all occasions. If you drop it in the hay loft, no oil can escape; if the cow kicks it over, it goes out at once.

It cannot blow out in a cyclone because of the storm blast feature. It is just the kind of a lantern every farmer needs about the house and barn.

Patent opening device raises and swings the globe free for lighting, filling and trimming. This lantern is fully guaranteed and is endorsed by the highest authorities on fire insurance, fire fighting and explosives. If dropped or turned over it immediately goes out. Oil cannot run. Impossible to catch fire. A lantern you will always feel safe with in the house or barn.

OUR OFFER

Send $2.00 for a three year new or renewal subscription to The Wisconsin Farmer and we will send you one of these Safety Storm Blast Lanterns as a premium free and postpaid.

An Old-Fashioned Farm Kitchen.

Our Grandmothers and Great-Grandmothers Did Not Have the Modern Kitchen Ranges and Utensils Used in Farm Homes Today.

THE scene illustrated herewith will be a familiar one to the older folks, but some of our younger readers will have to be told that it is an old-fashioned farm kitchen. The farm housewife of today will ask at once, "Where is the kitchen range?" or "Where do they do the cooking?"

Only within the past fifty years have ranges and modern cooking utensils come into common everyday use on the farms of the country. The scene herewith depicted illustrates a farm kitchen of seventy-five years ago. In revolutionary days such kitchens were common and a kitchen like the one herein shown was regarded as a model in the early days of settling up the grain-belt states. Some years before the war between the North and South a number of fine farm homes had sprung up near the Mississippi river in Wisconsin, Illinois, Iowa and Missouri and many of them had kitchens very similar to the one shown herewith.

The old-fashioned fireplace was the stove. The fire was held in place by use of "dogs" or "andirons" shown in the center of the picture. Cooking usually started when there was a fine bed of coals and this was made possible by using good-sized dry logs. From one side of the fireplace a long crane made of wrought iron extended over the blaze of coals. This crane was heavily braced and would hold several pots and kettles. The pots and kettles were suspended from the crane by means of pot-hooks of varying length. There was no way to regulate the heat so the pots had to be moved up and down to get them farther away or closer to the fire.

All of the utensils were iron and very heavy. The modern farm woman with her granite ware and aluminum ware would consider the old-fashioned utensils very heavy indeed.

Hanging at one side of the fireplace is the bellows which was used to "poke up" the fire or to start it when things moved rather slowly in the early morning. The teakettle was almost always singing over the fireplace and it was a peculiar kettle in that it had an iron standard in front by means of which it was tipped forward so that the water would run out easily. Modern compartment utensils were not heard of in those days and every article of food prepared was placed in a separate kettle. About the only exception to this was when the popular "boiled dinner" was on the menu. We still have our "New England Boiled Dinners," but they are prepared much differently than in the olden days.

Our women readers may wonder how the housewife seventy-five years ago heated irons on ironing day. Most farm women had what was called an iron furnace and this was filled with hot coals and covered with a flat lid. The flatiron rested on the lid until heated. Occasionally on a big ironing day the coals had to be changed several times, but it is surprising how long good live coals will retain heat in a furnace of this kind.

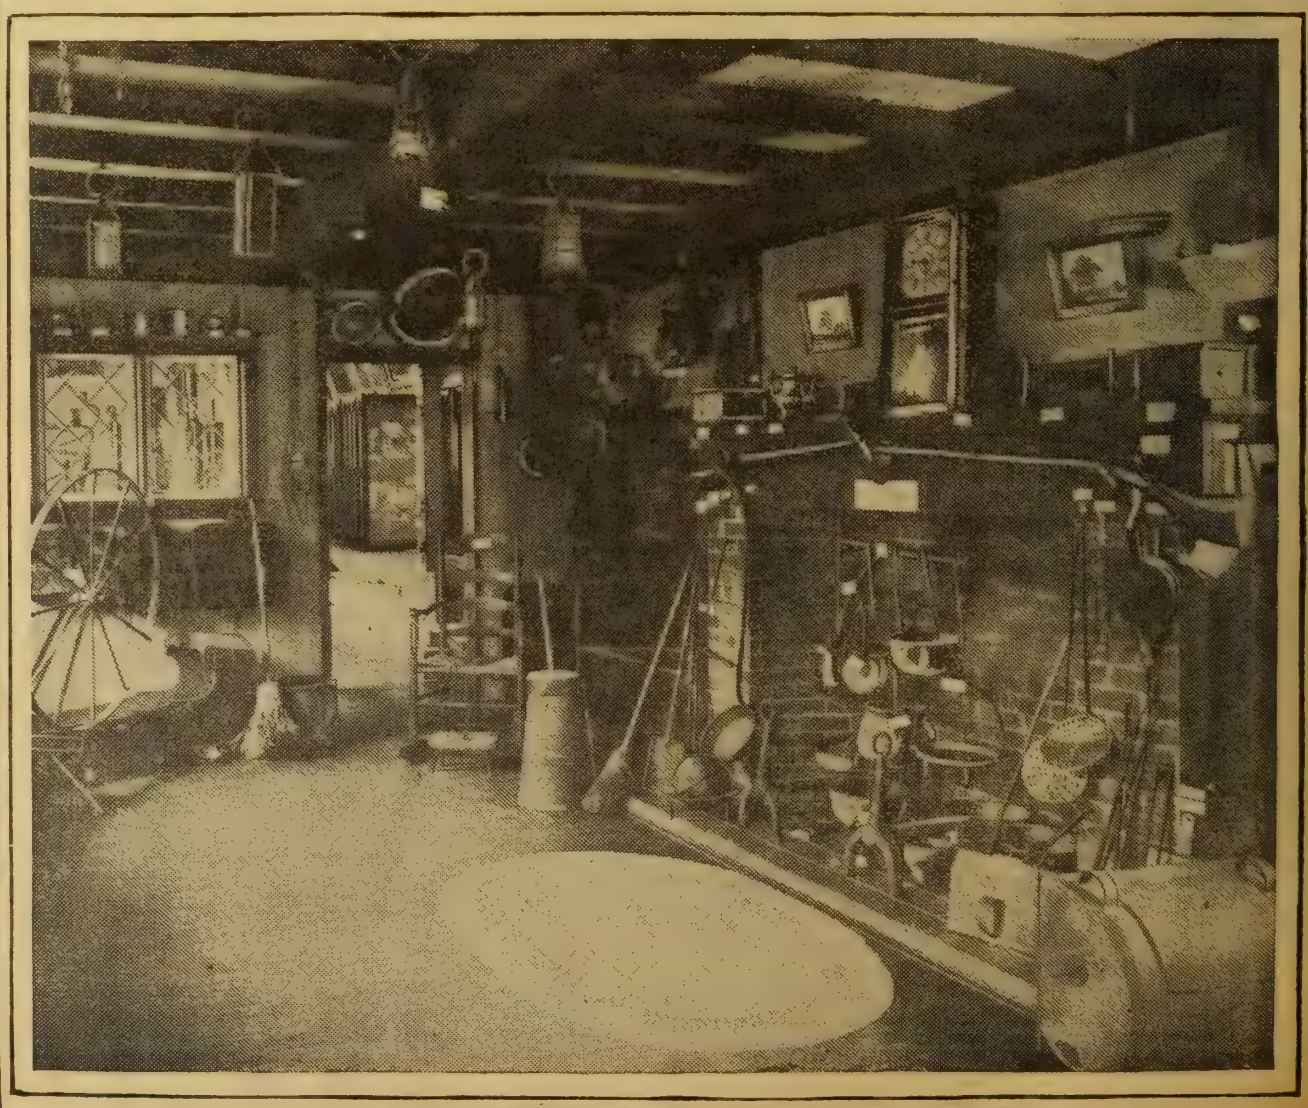
At the left of this fireplace rests a globelike utensil which is the old-time coffee roaster. Our ancestors did not get roasted and ground coffee in packages as we do now, but bought the green beans and placed them in this roaster which has a crank and can be revolved rapidly to keep the coffee from burning. The roaster was set on the fire when the coals were low.

At the extreme right of this picture is an old-fashioned "Dutch oven." This was used in colonial days for roasting birds and joints. The carcass was fastened by means of skewers and the oven turned with its open side toward the fire. The opening in the back was provided in order that the bird or roast might get the proper amount of basting without the cook getting her hands burned. Basting was considered a most important part of roasting by our earlier housewives. The skillet, frying pan and spider were in universal use seventy-five years ago. Now the names are often used interchangeably, but in those days each utensil had a separate use and identity. The spider was used for baking hoe-cake, a coarse bread made from Indian meal, salt and water. The skillet was considerably like a spider in appearance, but was smaller across and deeper, and was used for boiling eggs, making gravy and gruel. The frying pan was very much the sort of an utensil as the housewife uses today for frying chops and steaks. It was supplied with long iron legs and could be set in on top of the fire. A great many such pans were in early use in Wisconsin among the pioneers. Often the pan had a long iron handle sometimes with a wooden end, the purpose being to save the cook from the heat of the fire. Another common utensil of the early days was the griddle which was much like the griddle of today, only heavier, and with sides about three-quarters of an inch in height. Evidently they made thicker pancakes a hundred years ago than they do today.

It was, of course, very hot about this old-time kitchen fire and the cook was supplied with long iron forks. Hanging at the right of the fireplace will be seen a couple of skimmers, used to take grease off soups or to strain the water off any vegetables when taken from the pot.

Resting on the floor in front of the fire and near the "Dutch oven" is the broiler. The side toward the fire is open and supplied with sharp points which held the meat in place.

The scene herein shown is typical of the very early days in this country, having been universal in the homes of the colonists, and copied in the West until stoves and other more modern kitchen utensils came into use. This picture was taken in the historical museum of Wisconsin and the exhibit was gathered by the state. Parts of the exhibit came from many points in the West and from New England and New York. While not all of our western people, even the older ones, have ever seen a kitchen like this, they do remember the days when all cooking was done by the fireplace and when the spinning wheel, wooden cradle, churn and the rag rug graced the culinary department. The mantel clock shown in this picture is typical of the old days and there are many farm homes where such a clock is still running today.



FARM KITCHEN SCENE IN COLONIAL DAYS.

HEPSEY BURKE--A Sister to David Harum

By G. N. Wescott, the Brother of the Author of "David Harum."

(Copyright 1915.)

CHAPTER XIX.

Couleur de Rose.

HEPSEY had been so busy with helping the Maxwells that for some time no opportunity had occurred for Jonathan to press his ardent suit. Since his first attempt and its abrupt termination he had been somewhat bewildered; he had failed to decide whether he was an engaged man open to congratulations or a rejected suitor to be condoled with. He tried to recall exactly what she had said. As near as he could recollect it was: "I'll think it over and perhaps some day—" Then he had committed the indiscretion of grasping her hand, causing her to drop her stitches before she had ended what she was going to say. He could have sworn at himself to think that it was all his fault that she had stopped just at the critical moment, when she might have committed herself and given him some real encouragement. But he consoled himself by the thought that she had evidently taken him seriously at last; and so to the "perhaps some day" he added, in imagination, the words "I will take you;" and this seemed reasonable.

The matter was more difficult from the very fact that they had been on such intimate terms for such a long time, and she had never hitherto given him any reason to think that she cared for him other than as a good neighbor and a friend. Ever since the death of his wife she seemed to feel that he had been left an orphan in a cold and unsympathetic world, and that it was her duty to look after him much as she would a child. She was in the habit of walking over whenever she pleased and giving directions to Mary McGuire in regard to matters which she thought needed attention in his house. And all this had been done in the most open and matter-of-fact way, so that the most accomplished gossip in Durford never accused her of making matrimonial advances to the lonesome widower. Even Jonathan himself had been clever enough to see that she regarded him much as she would an overgrown boy, and had always accepted her many attentions without misinterpreting them. She was a born manager and she managed him; that was all. Nothing could be more unsentimental than the way in which she would make him take off his coat during a friendly call and let her sponge and press it for him; or the imperative fashion in which she sent him to the barber's to have his beard trimmed. How could a man make love to a woman after she had acted like this?

But he reminded himself that if he was ever to win her he must begin to carry out the advice outlined by Mrs. Betty; and so the apparently unsuspecting Hepsey would find on her side porch in the morning some specially fine corn which had been placed there after dark without the name of the donor. Once a fine melon was accompanied by a bottle of perfumery; and again a basket of peaches had secreted in its center a package of toilet soap "strong enough to kill the grass," as Hepsey remarked as she sniffed at it. Finally matters reached a climax when a bushel of potatoes arrived on the scene in the early dawn and with it a canary bird in a tin cage. When Hepsey saw Jonathan later, she remarked casually that she "guessed she'd keep the potatoes, but she didn't need a canary bird any more than a turtle needs a toothpick, and he had better take it away and get his money back."

However, Jonathan never allowed her occasional rebuffs to discourage him or stop his attentions. He kept a close watch on all Hepsey's domestic interests, and if there were any small repairs to be made at Thunder Cliff, a hole in the roof to be mended, or the bricks on the top of the chimney to be relaid, or the conductor pipe to be readjusted, Jonathan was on the spot. Then Jonathan would receive in return a layer cake with chopped walnuts in the filling, and would accept it in the same matter-of-fact way in which Hepsey permitted his services as general caretaker.

This give-and-take business went on for some time. At last it occurred to him that Mrs. Burke's front porch ought to be painted, and he conceived the notion of doing the work without her knowledge, as a pleasant surprise to her. He waited a long time for some day when she should be going over to shop at Martin's Junction—when Nickey usually managed to be taken along—so that he could do the work unobserved. Meantime, he collected from the hardware store various cards with samples of different colors on them. These he would combine and re-combine at his leisure, in the effort to decide just what colors would harmonize. He finally decided that a rather dark blue for the body work would go quite well, with a bright magenta for the trimmings, and laid in a stock of paint and brushes, and possessed his soul in patience.

So one afternoon, arriving home burdened with the spoils of Martin's Junction, great was Mrs. Burke's astonishment and wrath when she discovered the porch resplendent in dark blue and magenta.

"Sakes alive! Have I got to live inside of that?" she snorted. "Why, it's the worst lookin' thing I ever saw. If I don't settle him," she added. "—paintin' my porch as if it belonged to him—and me as well," she added ambiguously. And, catching up her sunbonnet, she hastened over to her neighbor's and inquired for Jonathan. "Sure, he's gone to Martin's Junction to see his brother, Mrs. Burke. He said he'd stay overnight, and I needn't come in again till tomorrow dinner-time," Mary McGuire replied.

Hepsey hastened home, and gathering all the rags she could find, she summoned Nickey and Mullen, one of the men from the farm, and they worked with turpentine for nearly two hours, cleaning off the fresh paint from the porch. Then she sent Nickey down to the hardware store for some light gray paint and some vivid scarlet paint, and a bit of dryer. It did not take very long to repaint her porch gray—every trace of the blue and the majenta having been removed by the vigorous efforts of the three.

When it was finished, she opened the can of scarlet, and pouring in a large quantity of dryer she sent Nickey over to see if Mary McGuire had gone home. All three set to work that evening to paint the porch in front of Jonathan's house. At first Mullen protested anxiously that it was none of his business to be painting another man's porch, but Mrs. Burke gave him a look which changed his convictions; so he and Nickey proceeded gleefully to fulfill their appointed task, while she got supper.

When the work was quite finished Hepsey went over to inspect it, and remarked thoughtfully to herself: "I should think that a half pint of dryer might be able to get in considerable work before tomorrow noon. I hope Jonathan'll like scarlet. To be sure it does look rather strikin' on a white house; but then variety helps to relieve the monotony of a dead alive town like Durford; and if he don't like it plain he can trim it green. I'll teach him to come paintin' my house without so much as a by-your-leave, or with-your-leave, lettin' the whole place think things."

As it happened, Jonathan returned late that night to Durford—quite too late to see the transformation of his own front porch, and since he entered by the side door as usual, he did not even smell the new paint. The next morning he sauntered over to Thunder Cliff, all agog for his reward, and Mrs. Burke greeted him at her side door, smiling sweetly.

"Good mornin', Jonathan. It was awful good of you to paint my front porch. It has needed paintin' for some time now, but I never seemed to get around to it."

"Don't mention it, Hepsey," Jonathan replied affably. "Don't mention it. You're always doin' somethin' for me, and it's a pity if I can't do a little thing like that for you once in a while."

Hepsey had strolled round to the front, as if to admire his work, Jonathan following. Suddenly he came to a halt; his jaw dropped, and he stared as if he had gone out of his senses.

"Such a lovely color; gray just suits the house, you know," Mrs. Burke observed. "You certainly ought to have been an artist, Jonathan. Any man with such an eye for color ought not to be wastin' his time on a farm."

Jonathan still gazed at the porch in amazement, blinked hard, wiped his eyes and his glasses with his handkerchief, and looked again.

"What's the matter with you? Have you a headache?" Hepsey inquired solicitously.

"No, I haven't got no headache; but when I left that porch yesterday noon it was blue, and now I'm blamed if it don't seem gray. Does it look gray-like to you, Hepsey?"

"Why certainly! What's that you say? Do you say you painted it blue? That certainly's mighty queer.

See These 1916 International Harvester Hay Tools

New and Better Side Delivery Rakes

BY all means see the 1916 International, Osborne and Keystone side delivery rakes and hay loaders before your haying season starts.

All Left-Hand Side Delivery Rakes

These new side delivery rakes are all left-hand rakes. Taking the stems as the mower drops them, they pick them up broadside on and slide the hay into light, airy windrows without threshing off leaves and blossoms. They form the windrow on the raked stubble, where the hay lies untouched until the loader comes along to pick it up.

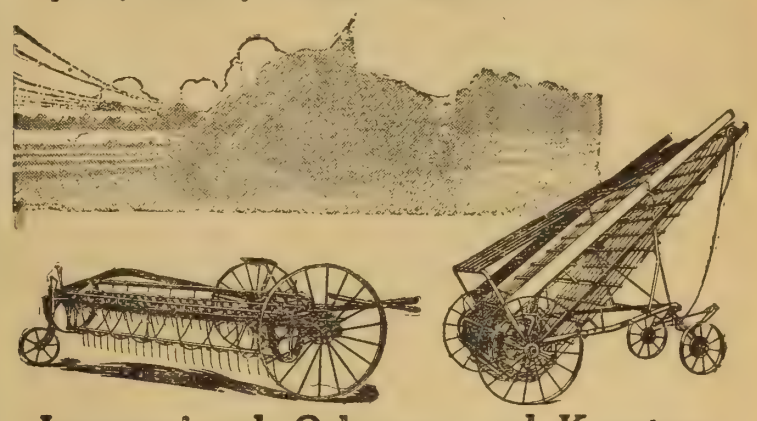
All Steel

International Harvester side delivery rakes are all steel, strong and durable.

Adjustments at Both Ends

The cylinder can be raised or lowered at both ends, giving perfect adjustment under all conditions.

Made in two widths—7 foot 3 inches and 8 foot (bean special). Sold by I H C local dealers.



International, Osborne, and Keystone Hay Loaders

The Windrow Loaders

If you use a side delivery rake to throw the hay up into windrows, you will need an **International, Osborne, or Keystone windrow loader.** These good loaders are 6 feet wide and elevate the hay to a height of 10 feet 3 inches. They gather the hay with a gentle hand-pitching movement that does not thresh or break leaves, so are especially good for loading alfalfa and clover. These loaders are easily hitched to the hay rack and are unhitched by the man on the load, who simply pulls a rope and drives off. A forecarriage (regular equipment) holds the loaders upright when unhitched, ready to be hitched at once behind another rack. Two horses can pull them easily.

The Rake Loader

If you ted your hay after mowing and do not throw it up in windrows, use a rake loader which takes in 8 feet of swath, elevates the hay to a height of 9 feet, and is handled by one man on the load. It gets in close to the fences; it handles the hay as gently as any good farmer could wish, and it rakes clean.

International, Osborne, and Keystone side delivery rakes, tedders, rake loaders, windrow loaders, sweep rakes and stackers, are sold by I H C dealers wherever farmers use these machines. If you want to get your hay in with the least trouble and expense, in the least time, and in the best condition, buy International Harvester hay tools. Write us for catalogues.

But then you know some kinds of paint fade—some kinds do!" She nodded, looking suspiciously at the work.

"Fade!" Jonathan sneered. "Paints don't fade by moonlight in one night. That isn't no faded blue. It's just plain gray. I must be goin' color blind, or something."

"It looks gray to me, and I'm glad it is gray, so don't you worry about it, Jonathan. Blue would be somethin' awful on the front of a white house, you know."

"Well," continued the bewildered junior warden, "I'm blessed if this isn't the queerest thing I ever see in all my born days. If I catch the fellow that sold me that paint I'll make it lively for him or my name isn't Jackson."

"Oh, I wouldn't do anything like that! What difference does it make, so long as I like the color myself; it's my house. I should have been very much put out if you'd painted it blue; yes, I should."

"But I don't like to be cheated down at the store; and I won't, by gum! They said it was the best quality paint! I'll go down to Crosscut's and see about this business, right now. I've traded with him nigh on twenty years, and he don't bamboozle me that way."

Hepsey turned away choking with laughter, and retreated to her kitchen.

Jonathan started back towards his house to get his hat and coat, and then for the first time he caught sight of his own porch, done in flaming scarlet, which fairly seemed to radiate heat in the brilliant sunlight. He stood motionless for nearly a minute, paralyzed. Then the color began to rise in his neck and face as he muttered under his breath:

"H'm! I'm onto the whole business now. I ought to have known that Hepsey would get the best of me. I guess I won't go down to Crosscut's after all."

Then he walked up to the porch and touched the scarlet paint with his finger and remarked:

"Set harder than a rock, by gum! She must have used a whole lot of dryer. I'll get even with her for this. See if I don't."

In the afternoon Jonathan brought over some fine apples and presented them to Hepsey, who was knitting on her side porch. She thanked him for the gift, and the conversation drifted from one thing to another while she waited for the expected outburst of reproach which she knew would come sooner or later. But curiously enough, Jonathan was more cheery and cordial than usual, and made no allusion whatever to the scarlet porch, which was conspicuously visible from where they sat. Again and again Hepsey led the conversation around to the point where it seemed as if he must break covert, but he remained oblivious, and changed the subject readily. Not a word on the subject passed his lips that afternoon.

Then, from day to day the neighbors called and inquired of her if Jackson had gone off his head, or what was the matter. His flaming porch outraged Durford's sense of decency. She was at her wits end to answer, without actually lying or compromising herself; so the only thing she said was that she had noticed that he had been acting a bit peculiar lately, now they mentioned it. As time went on, the scarlet porch became the talk of the town. It was duly discussed at the sewing society, and the reading club, and the general sentiment was practically unanimous that Jackson must be suffering from incipient cataract or senile dementia, and needed a guardian. Even Mary McGuire remarked to Mrs. Burke that she was afraid "that there front porch would sure set the house on fire, if it wasn't put out before." Everybody agreed that if his wife had lived, the thing never could have happened.

Meantime, Jonathan went about his daily business, serene and happy, apparently oblivious of the fact that there was anything unusual in the decoration of his house. When his friends began to chaff him about the porch he seemed surprised, and guessed it was his privilege to paint his house any color he had a mind to, and there was no law ag'in' it; it was nobody's business but his own. Tastes in color differed, and there was no reason in the world why all houses should be painted alike. He liked variety himself, and nobody could say that scarlet wasn't a real cheerful color on a white house.

Occasionally people who were driving by stopped to contemplate the porch; and the Durford Daily Bugle devoted a long, facetious paragraph to the matter. All of which Mrs. Burke knew very well, and it was having its effect on her nerves. The porch was the most conspicuous object in view from Hepsey's sitting-room windows, and every time she entered the room she found herself looking at the flaming terror with increasing exasperation. Verily, if Jonathan wanted revenge he was getting far more than he knew; the biter was badly bit. The matter came to a crisis one day when Jonathan concluded a discussion with Mrs. Burke about the pasture fence. She burst out abruptly:

"Say, Jonathan Jackson, why in the name of conscience don't you paint your porch a Christian color? It's simply awful, and I'm not goin' to sit in my house and have to look at it all winter."

Jonathan did not seem greatly stirred, and replied in an absent-minded way:

"Why don't you move your sittin' room over to the other side of the house, Hepsey? Then you wouldn't have to see it. Don't you like scarlet?"

"No, I don't like it, and if you don't paint it out, I will."

"Don't do nothin' rash, Hepsey. You know sometimes colors fade in the moonlight—some colors, that is. Maybe that scarlet porch'll turn to a light gray if you let it alone."

Mrs. Burke could stand it no longer; so, laying down her work she exploded her pent-up wrath:

"Jonathan Jackson, if that paint isn't gone before tomorrow, I'll come over and paint it myself."

"Oh, that isn't necessary, Hepsey. And it might set people talkin'. But if you won't move your sittin'-room to the other side of your house, why don't you move it over to my house? You wouldn't see so much of the red paint then."

Hepsey snorted and spluttered in baffled rage.

"Now, now, Hepsey," soothed Jonathan, "if that don't suit you I'll tell you what I'll do: I'll paint it over myself on one condition!"

"And what's that, I'd like to know?"

"That you'll marry me," snapped Jonathan hungrily.

Instead of resenting such bold tactics on the part of her suitor, Mrs. Burke gazed at him a long time with a rather discouraged look on her face.

"Land sakes!' she exclaimed at last with assumed weariness and a whimsical smile, "I didn't know I'd ever come to this; but I guess I'll have to marry you to keep you from makin' another kind of fool of yourself; widowers are such helpless mortals, and you certainly do need a guardian." She shook her head at him despondently.

Jonathan advanced towards her deliberately, and clinched the matter:

"Well, Hepsey, seein' that we're engaged—"

"Engaged? What do you mean? Get away, you—" She rose from her chair in a hurry.

"Now Hepsey, a bargain's a bargain: You just said you'd have to marry me, and I guess the sooner you do it and have it over with, the better. So, seein' that we are engaged to be married, as I was about to remark when you interrupted me . . ." Relentlessly he approached her once more. She retreated a step or two.

"Well! Sakes alive, Jonathan! Whatever's come over you to make you so masterful. Well, yes then—I suppose a bargain's a bargain, all right. But before your side of it's paid up you've got to go right over and paint that porch of yours a respectable color."

So, for once, Hepsey's strategy had been manipulated to her own defeat: Jonathan went off to town with flying colors, and bought himself a can of pure white paint.-To be continued.

"Billy" Sunday—
The Man and His Message

"I'll fight till Hell freezes over"

A Great Book for Every Home

It carries the message that led over 200,000 to hit the Sawdust Trail

"Billy" Sunday has probably led more persons to make a public confession of discipleship to Jesus Christ than any other man who ever lived. Making Christians is from all angles the greatest work in the world. Therefore the world may well ask "What manner of man is this?" For over 200,000 men and women have taken Mr. Sunday's hand in token that henceforth their lives would belong to Christ. Over 2,000,000 persons have listened to Mr. Sunday's voice and still the work goes on. Tens of thousands of those men who have been converted under Mr. Sunday's influence were husbands—hundreds of whom had been separated from their wives and children by sin. Now in reunited homes, whole families bless the memory of the Man of God, who gave them back husbands and fathers.

Every conceivable type of humanity is included in the total of over 200,000 converts. The college professor, the prosperous business man, the eminent politician, the farmer, the editor, the doctor, the author, the athlete, the "man about town," the criminal, the drunkard, the society woman, the college student and the working man.

GOD'S MAN SENT IN GOD'S OWN TIME.

The greatest single personal force in the social and political as well as the religious life of America today is Rev. William Ashley Sunday.

The crowds follow him. Neither rain nor cold, not even a blizzard, can keep them away. Week after week vast throngs of people wend their way daily to hear a strong man preach a strong gospel which can meet the real need of every human heart. This man is doing what college professors, political demagogues, statesmen, lecturers, orators and the most eloquent preachers are unable to do. He compels men and women to hear him. He reaches their hearts.

"You old skeptic, we are counting time on you"

Let the Message of this Great Man Influence You, Your Dear Ones and Your Home

Authorized by Mr. Sunday

This work contains the heart of Mr. Sunday's gospel message arranged by subjects, and published by special agreement with him for the use of copyright material and photographs, which could be used only by permission.

PROFESSIONAL Veterinary advice through this department to regular subscribers only. We do not answer veterinary inquiries for the benefit of "neighbors." Parties desiring information will be required to send their names in full with their address. No question will be answered by mail unless accompanied by a fee of one dollar. In order that correct information may be given, the symptoms should be accurately described, stating of how long standing, together with color and age of animal, and what treatment, if any, has been resorted to. Thoroughly good and reliable veterinary remedies are advertised from time to time on these pages. If they were not good and reliable they could not appear in our paper. Our readers are requested to look them over. You may find here some remedy which will exactly fit your case. All veterinary inquiries should be addressed to this office.

AILING ANIMALS.

Sidebone.

Will you please tell me if sidebone causes lameness in horses? I have a brown Morgan mare coming six years old that has been lame since last fall and I cannot see anything wrong with her except that she has sidebones on her front foot. At first she only limped when trotting. Last week I put her on the disk one day and since that she has been worse. One veterinarian told me sidebones did not cause lameness. Another said it was the cause and gave some medicine to blister them with, which I am using now. The mare is with foal.

Sidebone in the acute stage of development causes lameness, while in horses where its development has been arrested before going far the lameness is not noticed much. Even a sidebone that is "killed," so to speak, may cause lameness if it attained considerable size.

Black Teeth in Pigs.

I have pigs about two weeks old. They have sore mouths and I would like to know what is the cause and what could be done for it. The roof of the mouth and nose is sore and the lower jaw is festered. They have black teeth, but I don't know whether that would cause the trouble or not. My neighbor's pigs have black teeth and are doing well. What do those teeth look like and how many do they have? Do they have them below and above?

Black teeth in young pigs often cause a very painful, swollen condition of the tongue. These teeth are found on each side and usually project in such a way as to injure the tongue. These teeth should be removed with a pair of pincers. It does not seem, however, that these teeth are causing the trouble in your pigs. It is possible your pigs have either a stomatitis or have become infected with the bacillus causing necrobacillosis. Would advise you to clean and disinfect the pens and also clean and scrape off any scab formation on the pigs and wash the affected parts with a 2 to 5 per cent solution of creolin or lysol.

Sows Farrowing Dead Pigs.

I have a herd of thirty last spring sows that were bred last December and are now due to farrow. Some will have one or two live pigs and the rest in the litter are one-third formed, while most of the sows have no live pigs at all. The pigs are about four or five inches long and seem to be almost petrified. I have two male hogs which are full brothers. At breeding time last December I put fifteen sows to each male hog. I put them in pens far enough away so they could not see each other. I have been feeding corn and water, same as I have always done in the past, with the exception that this winter I have fed some stock food. My sows are Duroc Jerseys, as are the male hogs also. They have always had good appetites and have not been sick and do not seem sick now when they lose their pigs. They are always up for their feed. What do you think about breeding them two weeks from now to a different male for fall pigs? Please let me know what to do.

We have heard considerable complaint from farmers in regard to sows losing their pigs, some of which are mummified, some seem to have died just a short time before birth and other cases seem to be where the mother has had a case of abortion. Now, it is hard to say just what is at the bottom of some of these cases, but we have thought in some that it was a lack of exercise during the winter months, in others the feed seemed to be at fault and in still others too many pregnant sows were kept together and consequently some became injured. In your case we can see very little cause for trouble in the feed, but probably you have not let them have sufficient exercise. If there has not been any trouble with your sows on your premises before and these sows are of your own raising we see no reason why you should not breed them again as soon as the effects of the farrowing or abortion have passed off.

Nasal Discharge.

I have a five-year-old mare that discharges from one of her nostrils a sort of bloody pus which has a very bad odor. She has been smelling badly for a year, but I thought it was a bad tooth. I had that removed this winter, but with no benefit. At first she discharged a little when she was pulling or working heavy, but now it is all the time. She foaled April 3d. Her colt is in good shape, strong and all right every way. Can you tell me a cure, as this is a valuable mare.

It would seem from your description that your animal is suffering from diseased turbinates (turbinate bones of the head) or else has a diseased condition of the sinuses existing. There are a number of conditions which may cause such a discharge or a similar one. One must know just what is causing the condition before he can advise proper treatment. Your local veterinarian should be able to give you some light on this condition after making an examination. Things to be looked for where nasal discharges are found are such as diseased turbinates, diseased sinuses, decayed teeth, glanders and catarrhal conditions of the nasal chambers.

Abortion in Cows.

We would like a little advice on the subject of contagious abortion. We have about thirty high-grade Shorthorn cows and we are beginning to lose calves. About a year ago we shipped in a load of cows, some of which aborted and have since been disposed of. Now this spring the disease has spread to our own cattle. Can you give us a line of treatment that will enable us to keep our cows over, or would it be best to ship everything out and start afresh? We hate to do this, as it will be hard to replace them.

This subject has been handled before through the veterinary columns, but it will not come amiss in being published again. Contagious abortion is not only hard to handle, but brings about losses financially from losing calves, etc. Those which have not aborted should be kept in clean, sanitary quarters away from those affected. When a cow aborts the calf, afterbirth and secretions should be burned or buried in lime, and the infected quarters thoroughly disinfected with five ounces of sulphate of copper to one gallon of water. Bulls which serve the cows should have the sheath and belly washed before and after each service with 1 to 2 per cent creolin solution. Cows which have aborted should have their womb and vagina irrigated daily with a warm antiseptic solution until discharge has discontinued. They should not be bred for two or three months after aborting. One should not forget that this trouble is easily spread, and too much care cannot be taken. All body excretions, such as vaginal discharge, feces, urine, etc., are carriers. The use of abortus bacterin has proven quite successful in the hands of competent veterinarians. If one will use the abortus bacterin and use all other means of disinfecting, etc., results may be expected, but it takes time and patience. One should use care in introducing new cows on infected premises and have the bacterin used on them. You should employ the services of a veterinarian to give you first-hand advice, which he will be able to do after looking over the herd and the premises.

Soil conditions have an important relation to potato tuber diseases and many of these are widely spread throughout the country, perhaps native to some soils. Common scab is favored by a neutral or slightly alkaline soil and seldom gives trouble in acid soils. It is, therefore, increased by liming and by fresh stable manure, wood ashes and alkaline fertilizers, such as nitrate of soda and ground bone, while acid phosphate and sulphate of ammonia tend to diminish scab.

Kills Hog Lice—Ticks on Sheep
A Farm and Home Disinfectant

Gilbert Hess, M. D., D. V. S.

My Dip is a positive lice killer. I don't care how lousy your hogs are, dip, spray or sprinkle them with my preparation and you will get rid of these pests. Add it to the hog wallow occasionally during summer. It also kills ticks on sheep; in fact, my Dip will stamp out all parasitic skin diseases.

Dr. Hess Dip and Disinfectant

1 gallon makes from 70 to 100 gallons solution

You'll need this disinfectant frequently, especially during hot weather, for disinfecting stables, barns, chicken houses, troughs, sinks, drains. It destroys disease germs and foul odors and keeps the farm and home clean and sweet-smelling. Sold in pint bottles, quart, half-gallon and gallon cans, and barrels.

Dr. Hess Fly Chaser

It does not gum, color or blister. Makes stock comfortable.

DR. HESS & CLARK, Ashland, Ohio

One gallon cans $1.00
Smaller pkgs. as low as 25c (except in Canada and the far West).

Stock Without WORMS

I want you to try SAL-VET on my liberal 60-day test feeding offer. Tell me how many head of hogs, sheep, horses and cattle you have and I'll supply you with enough SAL-VET to last your stock 60 days.

"For two years I have been feeding SAL-VET. Before that, I tried many other remedies. I keep between two and three hundred hogs and seven horses. SAL-VET keeps stock well and prevents disease." Frank D. Hall, Bloomfield, Conn.

The Great Worm Destroyer **SAL-VET** The Great Live Stock Conditioner

"My shoats were very wormy. After other remedies failed, I fed SAL-VET, which cleaned out the worms and put all hogs, sheep and horses in condition." H. O. Norris, Route No. 1, Center, Mo

Will rid your stock of WORMS—the blood-sucking parasites that cause 90 per cent of all live stock losses. It will give your farm animals keener appetites, better digestion—make them thrive better—pay you bigger profits. When it arrives, pay the freight charges and feed it according to directions for 60 days, if it does not do what I claim, make a specific report in 60 days and I will make no charge. Address SIDNEY R. FEIL, President.

Live Stock and Commercial Field Notes

Collected by Representatives of The Wisconsin Farmer

A Great Sale of Holsteins to be Held at Marshfield, Wisconsin.

ON Wednesday and Thursday, May 10th and 11th, there will be a sale of Holstein cattle at Marshfield, Wis., that should appeal to all lovers of this breed. For this, the third public sale made by this association, the consignors are selling Holsteins superior to any sold in previous sales. This is not a sale where the culls, non-breeders and tuberculin cattle are sold, but one where animals of the choicest breeding and individuality will be offered. The Marshfield consignors enjoy the reputation for square dealings and you will find the same thing true of this coming sale. In all 125 head of Holsteins have been listed by consignors whose names appear in the advertisement which is on page — of this issue. T. F. Vannedom, of Marshfield, will contribute three head that would be attractions in any sale. Mr. Vannedom has the honor of raising the grand champion female of the 1914 dairy show, Minerva Beets 85791, and the three head that he is selling are of the same high-class caliber. Imig Bros., popular breeders of Neillsville, Wis., are consigning several head, among them being an eight-months-old bull that is a comer. His dam and sire's dam average 29.41 pounds butter. Here is a good herd bull prospect. They are also selling five females, four of which are out of A. R. O. dams and all are sired by their good breeding bull, Plain View Johanna Fayne. J. Schmidt, of Arpin, has one of the good herds of Wood county. Several cows in his breeding herd have good seven-day and yearly records and twelve cows that were in the local testing association made an average of over 50 pounds butter fat during the month of February. The fact that he is selling some of these good cows or their daughters should prove drawing cards. E. E. Butters, Marshfield, and one of the live wires of the association, is selling some good bulls in the sale. Among them is one out of a twenty-two-pound two year old. Those attending this sale will be most comfortable, immaterial of weather conditions, for the sale will be held in one of the most modern sale pavilions in the Northwest. The catalog is very complete and interesting and will appeal to all lovers of this breed. If you haven't received your catalog you will get one if you will write E. E. Butters, Marshfield, Wis., and mention The Wisconsin Farmer. Don't forget the time and place and arrange your business so that you can attend one or both days. See page 29.—Adv.

Birch & Thompson's Hereford Sale.

BIRCH & THOMPSON, Lake Geneva, Wis., will hold their second annual sale of Hereford cattle on Thursday, May 18th, on their farm, one mile east of Williams Bay. The writer recently had the pleasure of spending a day at this farm and looking over this worthy and well-known herd of white-faced cattle. This herd is not surpassed nor even equaled, but by few herds, either in breeding, in breed type or in development. The foundation stock came from the well-known herd of Thompson & Son, Illinois, who have been breeding for a quarter of a century. The bulk of the breeding is along the noted Bonnie Brae and Beau Perfection lines. For several years a show herd has been sent out from this farm and the many ribbons won testify to the high quality of the animals shown. The offering in the sale consists of forty-eight head of choicely bred and developed animals. There are fifteen yearling bulls, several of which are outstanding individuals and worthy of the attention of the best breeders. They are great show prospects and will prove great breeders. The offering of females is especially attractive all the way through, and our readers who are in the market for a few additional females cannot afford to miss this opportunity. Colonel Reppert assisted by Colonel Igelheart will cry the sale. H. S. Hoard will represent The Wisconsin Farmer. All trains coming to Walworth, Elkhorn and Williams Bay will be met. For further information write to the above address. When writing kindly mention The Wisconsin Farmer. See page 30.—Adv.

Chief Defender-Big Col.

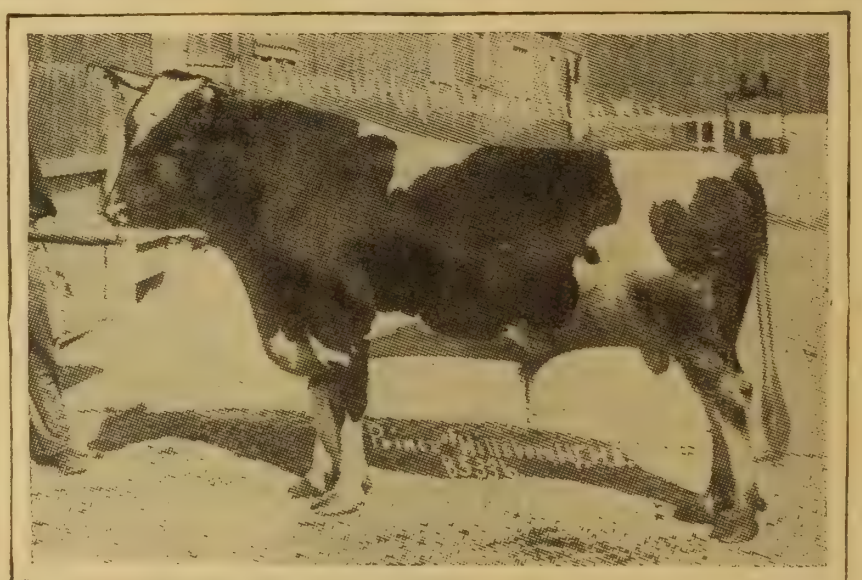
WE have just had a letter from Geo. H. Willsie, Prosper, Minn., owner of the two great boars, Chief Defender by Defender and Big Col. by King the Col. Some time ago we called attention to these boars as being two of the best Duroc boars that we have seen in the Northwest. Mr. Willsie writes that he is raising the best bunch of pigs he ever had farrowed on his farm, most of them by the above-mentioned boars. The sows in this herd are big and having litters by these two big-type boars the result should produce something good. Don't forget about these boars and this herd. The owner doesn't care to sell anything at this time, though I suppose he would price a pair or a trio and if he will it would be a good place to send your order. If you write please mention The Wisconsin Farmer. See page 31.—Adv.

Freehoff's Berkshires.

W. A. FREEHOFF, of Waukesha, Wis., whose Berkshire advertisement is appearing regularly in this paper, is offering a herd boar at a bargain. His is Sallie's Superbus, a son of the great Superbus at the head of the Corsa herd. He is two years old, a fine individual and a sure breeder of large litters. If bought within the next month, he will be sold for $50; or gilts will be taken in exchange. Mr. Freehoff is also offering a fine lot of sows being bred for fall farrow at $35 to $50 and not a cull in the lot. Better add one of these to your herd. He also has five fine fall boars for sale at $15 to $35, depending on quality. When writing him, mention this paper. See page 32.—Adv.

Lindauer's Holsteins.

ANOTHER choicely bred Holstein bull is advertised for sale on page 32 by L. Lindauer, Kaukauna, Wis. This young bull was born September 20, 1915. He was sired by King Segis Pontiac Polkadot, a full brother in blood to the $50,000 sire, King Segis Pontiac Alcartra. Both of these bulls were sired by the thirty-seven-pound bull, King Segis Pontiac, a son of King Segis and both of them were out of daughters of King of the Pontiacs and the cow, Alcartra Polkadot Ormsby. The dam of the young bull offered for sale at two years and four months of age made fourteen pounds of butter in seven days. She is a granddaughter of the noted bull, King Segis and also Sir Hengerveld Model Johanna, that has twenty-four A. R. O. daughters with very creditable records, several of them above twenty-five pounds of butter in seven days. His dam's dam, Rigtje 3d Lady Hengerveld, at three years and three months of age, made 22.96 pounds of butter. As official testing is continually being done in this herd, the young bull offered for sale, will grow more valuable the next time his dam is tested. For an extended pedigree and further information write to the above address.—Adv.



PRINCE OF HILLSBORO 85336. Sire of the twenty-one-pound Holstein bull advertised for sale on page 32 by Griem & Hipke, New Holstein, Wis.

The 1916 I. H. C. Hay Tools.

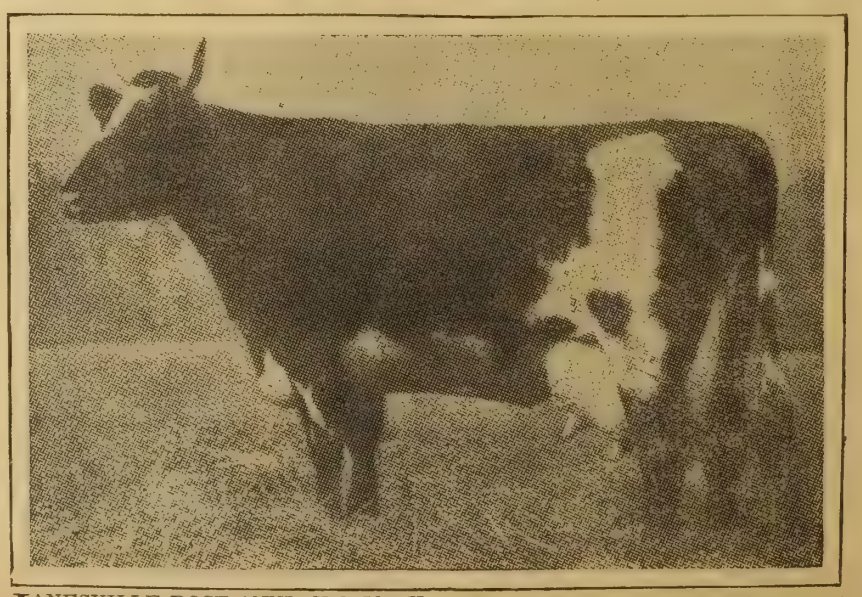
HOW are you supplied with hay tools, this season? Perhaps you will need a new rake or loader. If so, you should see the new 1916 International, Osborne and Keystone side delivery rakes and hay loaders, and decide what you want before the haying season starts. These new side delivery rakes are all left-hand rakes, which enables them to take up the stems as the mower drops them, pick them up broadside, and slide them into light, airy windrows without crumbling the leaves. The cylinders can be raised or lowered at both ends, giving perfect adjustment. The new hay loaders are made as windrow or rake loaders. They are easily hitched to the hay rack and the man on the load can unhitch them by simply pulling a rope. All of these tools have the superior strength and durability characteristic of machines made by the International Harvester Company. They are for sale by all I. H. C. dealers. Be sure to send for the catalogs of these tools; address International Harvester Company, Chicago, Ill., and kindly mention this paper. See page 25.—Adv.

Hank Derenthal's Chester Whites.

IT will please the many friends of Hank Derenthal to know that he will be able to leave the hospital, where he has been since Thanksgiving, on April 24th, and after that one can find him among his good Chester Whites at Wykoff, Minn. Mr. Derenthal has, perhaps, the best herd of this breed in the state, at least animals from his herd have won more premiums than his competitors. The boar that helped to put this herd "on the map" was Wykoff Lad, a boar that has five championships to his credit. No one in the state has more good sows than Mr. Derenthal and some of the best are by this boar. He has retained one of the best sons of Wykoff Lad for his own use. This boar he has named Ignatz and even though being handicapped with such a name, he succeeded in winning junior champion honors at Minnesota, North Dakota and La Crosse Interstate Fairs. Around 150 pigs represent the spring crop and they are doing fine at this writing. He expects to get busy with his show stuff and if he takes out a herd you will, of course, see one that is fitted to the minute, for Mr. Derenthal is a caretaker. We will have more to say about this herd in the future.—Adv.

Angus Bulls and Females for Sale.

F. C. LEWIS, Bridgeport, Wis., is offering some young Angus bulls and a few females for sale. These are very choice individuals and the prices asked is reasonable. Here is your opportunity. Write for prices and description and please mention The Wisconsin Farmer. See page 30.—Adv.



JANESVILLE ROSE 12TH. Vol. 58. Has a record of 336 pounds of 4.1 per cent milk in seven days. Sire, Gifford Clay 152044. Her dam, Janesville Champion Rose 102, gave at St. Louis World's Fair in 120 days 3,563.5 pounds of milk which made 149 pounds of butter. Owned by Harvey H. Little, Evansville, Wis., whose herd contains many descendants of this great cow. See page 31.

Cloverdale Farm.

ONE of the beautiful farms of Rock county, Wis., is "Cloverdale" owned by Jas. Van Etta, Lima Center, breeder of registered Clydesdale horses, Ayrshire cattle and Duroc Jersey swine. Even though Mr. Van Etta has not been before the public long, as a live stock breeder, he has demonstrated the fact that he can bring out stock as good and oftentimes better, than his competitor. If the owner's plans materialize, Cloverdale will be one of the most modern farms in the state. We do not mean that it will be a "picture farm," but the buildings will be up to date and modern for the purpose intended. Mr. Van Etta was the only breeder from Wisconsin that was represented at the World's Fair. He showed his Clydesdale horses and was the heaviest winner showing this breed. The breed's sensational horse was Charter Oak, first-prize aged stallion and grand champion of the show. This horse was owned and shown by Mr. Van Etta and now heads the Cloverdale stud of "Clydes." Charter Oak is the flashiest mover of this breed that we have ever seen—he has wonderful knee and hock action and goes perfectly straight. He is a wonderful stallion from inheritance, being a grandson of the one and only Baron's Pride, on the sire's side, his dam, Mae Summers, is by Prince Punctual, the greatest sire that Donald Campbell ever owned, and he in turn by Handsome Prince, the stallion that made such a reputation for the McLay Brothers. There is a wonderful two-year-old stallion on this farm. We will give you his show record and you can judge for yourself. As a yearling: First at Iowa and Wisconsin State Fairs, first and reserve champion at the Minnesota State Fair. As a two-year-old he was first at Iowa and Minnesota and second in the open class at the World's Fair. He will be a hard colt to beat in his class this fall. Of the mares on Cloverdale Farm, a rising two year old is the attraction. She is a wonderful filly in all respects. She was shown at the Iowa State Fair as a foal and was first and reserve champion. She was shown in her yearling form at the coast and was placed second. She is out of Princess Hansome by Hansome Prince, the only mare that ever won first at the International four times. We will have more to say about the "Clydes" at a later date, but bear in mind the fact that they have few equals in the country. Within the past year an Ayrshire herd has been added and we are glad to say that they are in keeping with the individual excellence of the other pure-bred stock on the farm. Those that follow this breed of cattle know of the great Ayrshire herd owned by John Sherwin, Willoughby, Ohio, said to have the largest herd in America. Mr. Van Etta purchased thirty-five head and several calves from Mr. Sherwin. Of the thirty-five head purchased twenty-four have A. R. records. White Cloud of Hickory Island is the sire of nine head of females in this herd that have large milk and butter records. This bull has twenty-seven A. R. daughters whose average milk production is larger than that of any other bull of the breed. At the present time two young bulls are being offered for sale, either of which are herd bull prospects. One born August 3, 1915, mostly white, sired by imported Craigbrae Lord Roseberry by Craigbrae Buccleuch, out of Bonnie Miss Casanet of So. Farm and her dam has a three-year-old record of 480 pounds butter and 11,141 pounds milk. Here is an excellent individual and he is being priced far below his value. The other bull being offered was born October 22, 1915, evenly marked and sired by So. Farm Spicy John, whose dam has a record of 598 pounds butter. The dam of the young bull is Miss Flossy of So. Farm whish has six A. R. sisters. This cow was sired by the White Cloud bull mentioned above. It would be hard to get better backing than these two young bulls have and as individuals they will bear inspection. We urge anyone in need of an Ayrshire bull to investigate these—they will please you. Notice the advertisement on page 31. Write for further information and please mention The Wisconsin Farmer. —Adv.

Complete Farm Buyers' Directory Free.

THE Farm Directory, just issued by the Strout Farm Agency, should be in the hands of every person who is interested in buying a farm. In this booklet are listed 360 carefully selected farms which are for sale, in the fertile districts of the eastern states, from Maine to Maryland, and west to Ohio. Accurate descriptions and prices of these farms are also given; the location, buildings, character of soil, markets and shipping facilities are clearly set forth, and the terms of sale are stated with the price. For ready reference, this handy farm buyer's directory is divided into ninety separate sections and the advantages of each region are concisely stated. Another advantage of this directory is the complete directions given for reaching each farm, while the name, address and telephone number of the nearest Strout Farm Agent are also included. The experienced farmer or the city man who wants to get back

125 PURE-BRED HOLSTEINS FOR SALE

A Few Pure-Bred Guernseys, One Pure-Bred Percheron Draft Stallion and Two Grade Percheron Draft Mares also offered at

MARSHFIELD, WIS., WEDNESDAY-THURSDAY, MAY 10-11

AT THIS the third sale in the magnificent sale and show barn in Marshfield, a better quality of stock is offered, and there is every promise that this sale will make new records. Breeders in the vicinity of Marshfield are united in their efforts to produce better stock and they have been meeting with wonderful success. A picture of the sale and show barn in which this sale is to be held will be found herewith. This barn contains 176 patent stanchions and sixteen box stalls. We have ample room to show stock and give buyers the best of chance to see what they are buying. There is a sixty-foot sale ring in the center of this barn with seats for over 1,000 people. One hundred and twenty-five pure-bred Holsteins will be offered for sale on the above dates and place. T. F. Vannedom, of Marshfield, will contribute three head that are stable mates of Minerva Beets 85791, grand champion at the 1914 dairy show. Mr. Vannedom raised the above cow, and what he is contributing is of the same quality. Imig Bros., of Neillsville, are putting six head in the sale, one an eight-months-old bull whose dam and sire's dam average 20.4 lbs. butter. The five cows are as follows: A two-year-old daughter of a 14-lb. two year old. A three-year-old daughter of a 20 lb. three year old. The other three have 20-pound dams. Four of the five are A. R. O. cows, and all are sired by Plain View Johanna Fayne. Jake Schmidt, of Arpin, is consigning several head. In this herd we have some very good yearlings as well as seven-day records. Mr. Schmidt has twelve cows in the local cow-testing association. Last month they averaged over fifty pounds of butter fat. E. E. Butters is offering some very good bulls. One from a 22-pound two year old. Others about equally good. Following are the names of some of the other contributors: J. C. Kieffer & Sons, Auburndale; Wm. Krause, Thorp, Wisconsin; McMillan Bros., McMillan, Wisconsin; F. W. Fisher, Thorp, Wisconsin; John F. Kelley, Neillsville, Wisconsin; C. H. Imig, Junction City, Wisconsin; O. J. Leu, Grand Rapids, Wisconsin. A few pure-bred Guernseys will be offered. One pure-bred Percheron draft stallion. Two grade Percheron draft mares, and one good farm team. For catalog write to

A Pioneer Poland China Breeder.

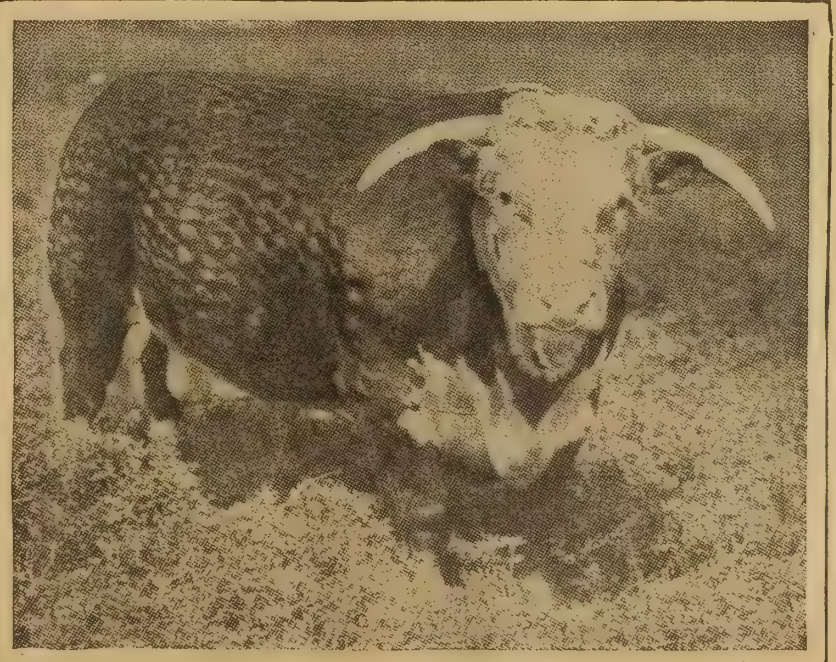
WE doubt if there is a breeder of Polands in the state of Wisconsin that has been in the game longer than R. Meinking, of Bangor, Wis. He bought his first pair of registered Poland Chinas some twenty-five years ago and since that time he has never ceased to raise the pure-bred Polands. His first pair of pigs cost him $75 and many in his locality thought that he would surely go broke paying so much for a couple of pigs. The fact that he stayed by the Polands this quarter of a century should be proof that they have made him money. Naturally Mr. Meinking has been through the ups and downs of the hog game—has seen the fads come and go, but he continued to "raise hogs." Mr. Meinking's favorite early strains were the Sunshines, Perfections and Bankers. When the tide turned to the big type he did not sell off his hogs at once and go in for the big, rough boar, but stayed by the type it had taken years to build up. We all know that the medium type had the quality that we all like, but we also know that they didn't have the size that we liked best. This breeder, like many others, kept his best medium-type sows and bred them to a big-type boar. He increased the individual size of his herd, yet he maintained that wonderful smoothness and quality. He has some sows of the strictly big-type breeding, one being a daughter of Big Joe out of a dam by A Wonder 107353. He has the Hadley-Chief Price 2d cross. Some are sired by boars of Big Bone 2d breeding. His present herd boar is Big Victor by Victor, tracing to Big Bone. His dam is by Blue Valley Exp. Jr. by Blue Valley Exp. This is a real good boar, full of quality and will weigh at this time right at 700 pounds in his two-year-old form. We saw a grand spring litter by this boar out of a line-bred Dry Creek Chief sow. This is some litter. In all he has around 130 pigs, most of which are of March farrow. At the present time fall boars are being offered for sale. They are nicely grown and we feel confident they will make good. Write R. Meinking, Bangor, Wis., and let him tell you about his Poland Chinas. Don't forget to mention The Wisconsin Farmer. See page 31.—Adv.

Reid's Yellow Dent Seed Corn for Sale.

HIGH quality Reid's Yellow Dent seed corn is advertised for sale on page 16 by J. N. Hutchinson, Dixon, Ill. This corn will test from 95 to 98 per cent germination. It is an early maturing corn and will do well where the growing season is from ninety to one hundred days long. If you want good seed corn of strong vitality, write to Mr. Hutchinson for it.—Adv.

The Alcartra Family of Holsteins.

THE Alcartra family of Holsteins has attracted the attention of the whole dairy world continuously for the past twenty years. Wisconsin may well feel proud of this great family of Holsteins, for wherever found, whether in the hands of experts or ordinary dairymen, or whether in California, Wisconsin or New York, they prove to be outstanding animals. This has been true of the Alcartra-bred cows in the herd of Griem & Hiphe, New Holstein, Wis. Nine years ago they purchased the cow, Nig Alcartra Pearl, a daughter of the great bull, Pearl of the Dairy Joe De Kol, which has seventy-five A. R. O. daughters. Her dam was Nig Alcartra 2d which has six A. R. O. daughters, a record equalled by but few cows. Three of her daughters have records of 23.95, 24.18 and 25.49 respectively. However, her daughter, Nig Alcartra Pearl, has equalled her record and also has six A. R. O. daughters, three with records of 21.60, 24.22 and 27.54 pounds respectively. Nig Alcartra Pearl is therefore a heavy producing cow which has inherited heavy producing blood and has transmitted it to her daughters. In breeding she is 75 per cent the same blood as the great cow, Alcartra Polkadot, which astounded the dairy world many years ago by making the then world's record of twenty-six pounds of butter in seven days. She now has a twenty-nine-pound record. Nig Alcartra Pearl is by the same sire and is out of a sister to her dam. Tilly Alcartra, a granddaughter of Alcartra Polkadot, holds the world's milk record by giving 30,000 pounds of milk in a year and 60,000 pounds in two years. Another member of the Alcartra family that startled the dairy world was when a half interest in the bull, King Segis Pontiac Alcartra, sold for $25,000. He is a close descendant of Alcartra Polkadot. It will be seen that the Alcartra family is one of exceptional productive ability and their worth is recognized by the best breeders. At the present time Griem & Hipke are advertising a yearling bull for sale on page 32. He is out of Nig Alcartra Pearl Daisy that made 21.60 pounds butter and 89.86 pounds butter in thirty days. She is a daughter of the foundation cow, Nig Alcartra Pearl, and her sire was Bergsmer Canary Paul that has twenty A. R. O. daughters. The bull offered for sale is sired by Prince of Hillsboro 4th that already has five A. R. O. daughters and a large number of others to go on test in the fall. For an extended pedigree and further information in regard to this bull write to the above address.—Adv.



BEAU PERFECTION 33D, sire of many of the Herefords to be sold May 18th by Birch & Thompson, Lake Geneva, Wisconsin. See page 30.

Reports Good Boar Sales.

WE have just had a letter from L. F. Atwater, the popular Duroc breeder, of Bangor, Wis., advising that he has 160 spring pigs, 120 of which came in March. These are sired by the champion, Lee's Defender, the champion, Prince Illustrator, and Model King, a son of the many times champion, High Model. This is a grand assortment of breeding and buyers will have an opportunity to buy the very best this fall. At this time Mr. Atwater has a few fall boars that are ready to ship. Most of them are by Lee's Defender and out of the good, big sows for which the Atwater herd is noted. He is also offering three yearlings. One is by Lee's Defender, one by Corrector and one Model Gano boar. Among the recent sales he reports the sale of a yearling to Cedar Lake Farm, Mikana, Wis. This boar Mr. Atwater expected to retain for the shows this fall, but he got his price and let him go. Another yearling has been sold to John H. Cashel, Worthington, Minn. One yearling has gone to Nels Johnson, Waukon, Iowa. Those who will want a boar to use for fall litters should get busy at once and make your selection before the boars have been picked over. We might say right here that the good fall boars are very scarce this year, for owing to the short corn crop few breeders carried them over. So again we say, order early. Write Mr. Atwater. He has boars for the breeder and farmer and prices them accordingly. Don't forget to mention The Wisconsin Farmer. See page 31.—Adv.

Popularity of the Velie Six Is Growing Tremendously.

THE volume of sales of the Velie Six for April were much greater than for any similar period, and still greater increases are expected. Without doubt, the Velie Six is growing in popularity tremendously. The reason for this lies in the exceptional quality of the car and a broadening knowledge of the soundness and integrity of the Velie organization. The Velie Six offers all

that may be expected in a combination of beauty, convenience, comfort and economy. A few of the prominent Velie features are listed in the advertisement on page 9; you should have a catalog, if you would be interested in a new car, and learn all about the Velie. Write for one today to the Velie Motor Vehicle Company, Moline, Ill., and please mention this paper.—Adv.

The Best Two-Year-Old Duroc Boar We Have Seen in Wisconsin.

THE above is a pretty strong statement to make, but we make it without fear of contradiction. There may be another boar equally as good "in the woods" some place that we have not seen, but the McClurg Bros., of Viroqua, Wis., have the best boar of this age and breed that we have seen in the state. This boar has just turned two years old—March 22, 1914—and he is some boar from end to end. The McClurg Bros. are young in the game and have not pushed this boar at all and he is not fat by any means, yet he will weigh right at 700 pounds now. The writer measured him, with his head up, and from his poll to the root of his tail he measured sixty-four inches; understand, that is not from tip to tip. He has a sixty-two-inch heart girth and with the cord pulled tight he showed an eight and one-half-inch bone. He is as smooth as he can be made, has a wonderful back and few boars of the breed have better or deeper hams. Those of our readers who expect to show boars of this age at the state fair want to get busy right away, for if the owners will give him proper care it is going to take a good boar to beat him. He is sired by Lee's Defender and his dam, Golden Queen 38th, was by Golden Model 2d. He gets his size from the Defender side and his wonderful quality from the Golden Models, a most desirable cross. Just keep this boar in mind and if any of our readers have a boar that they think is a contender we would be glad to have them write this office, for we are trying to get a line on the good boars of the state. Another young boar in this herd is Royal King 4th. This fellow is a March yearling and one of great frame, though very thin at this writing. He is sired by the $2,650 boar, Royal King. As above mentioned this boar is very thin, yet he has an excellent, strong arched back, has good bone and with a little finish is a very fair boar—above the average. the only one made which can be run at varying speeds without losing cream. It skims clean at thirty-five, forty-five or fifty-five revolutions a minute with equal efficiency. Experiment stations have shown that a considerable amount of cream is lost by some separators when the speed is reduced. Such is not the case with the Sharples. In addition the Sharples is an exceptionally easy separator to operate and clean. The low supply tank makes it easy to fill; the crank turns easily; and there are no discs to wash and bother with. If you keep dairy cows for profit, the the Sharples catalog will interest you. Write today for a copy. Address The Sharples Separator Co., West Chester, Pa., and kindly mention this paper in your letter. See page 19.—Adv.

A Great Herd of Poland Chinas.

WHEN talking about a good Poland China herd one can't overlook the one owned by E. W. Hendricks, Hazel Green, Wis. He is a brother to J. C. and if you think these boys can't produce Polands you are mistaken. J. C. has been in the business longer than his brother, but E. W. is such a close second for his brother that there is no fun in it. In all herds there is some one boar that has been instrumental in making a reputation for his owner. Big Bug was a wonderful boar in this herd, but his true value wasn't realized until his daughters had come to maturity. Big Bug was by Big Bone. The sensation as a breeder in this herd at the present time is Black Jumbo, a boar that is a wonderful producer. Black jumbo is sired by Heavy Bone, he a grandson of Big Bone. His dam, Big Mollie is by Chief Nelson, he in turn by Chief Price 2d. With this breeding, is it any wonder that he is a breeder out of the ordinary? In Mr. Hendricks' last winter sale, the first one he ever held, eleven gilts sired by Black Jumbo made an average of $79. Eleven sows bred to him averaged $81.50. This showed what the breeders thought of him and knew it was to their advantage to get some of his blood in their respective herds. There is a fall yearling in this herd that is siring a likely bunch of Polands. His name is Big Oakland and is sired by the 1,000-pound boar, Oakland's Equal, that by the way is a full brother to what Henry Fesenmeyer thinks is the greatest boar he ever owned since A Wonder-Big Joe. The dam of Big Oakland is A Wonder Belle by A Wonder 107353. It will be no accident if this boar makes one of 1,000 pounds at maturity. Most of the spring pigs are by Black Jumbo and E. W. will have some Polands to show his friends this fall that will be "eye openers." Mr. Hendricks can tell some of the "old timers" something about raising big-type Polands and when some of you Poland China breeders want to see some of the good herds of the state just make it a point to visit this herd. We will have more to say about this good herd in the future; in the meantime if you are in need of anything in the way of Polands, this would be a good herd to investigate. His advertisement appears in this issue and if you write please mention The Wisconsin Farmer. See page 31.—Adv.

NEXT WEEK'S SALE PROGRAM

Monday, May 8	Holsteins, Frank Ubbelohde, Sec., Plymouth, Wis.
Wednesday, May 10	Holsteins, Guernseys and Percherons, E. E. Butters, Marshfield, Wis.
Thursday, May 11	Holsteins, Guernseys and Percherons, E. E. Butters, Marshfield, Wis.

These gentlemen are offering three fall gilts and three fall boars for sale, sired by Prince Defender, the first boar mentioned. As is the general rule this year, the fall stuff has not been cared for as they should have been and these boars and gilts are no exception to the rule. Of the gilts there is one that is worth what they are asking for the three if someone will take her and grow her out. There is also one real good fall boar. Here is a chance for someone to get bargains in either gilts or boars. Better buy the three gilts and if this boar gets the place we think he will at the state fair, you can double your money. In case you write McClurg Bros. for information or prices will you please mention the fact that you saw the advertisement in The Wisconsin Farmer. See page 31.—Adv.

Don't Overlook Hauk Brothers' Angus.

IF you are interested in Aberdeen Angus cattle you will be pleased with the herd owned by Hauk Brothers, Cassville, Wis. They haven't the largest herd in the state, but they have some good individuals and they have a choicely-bred bull at the head of their herd. Ther breeding herd represents the noted families of the breed. They have a few bulls of serviceable age and some fine youngsters that will be ready for service in a very short time. Maybe you are not ready for a bull at this time, but it would be well to get a "line on" this herd and then when you want something in the future you would know where to find the class of stock you want. We gladly recommend this herd. In writing for pedigree and other information, will you kindly mention The Wisconsin Farmer? See this page.—Adv.

Write Today for the Sharples Catalog.

EVERY farmer and dairyman should have a copy of the Sharples catalog, "Velvet for Dairymen," because it contains valuable information on dairying subjects, particularly cream separators. This information is presented in an interesting, concise form for busy me to read. The new Sharples Suction-Feed cream separator is described in detail. This separator is claimed to be

Bulls From Milking Short-horns.

WITH this issue of The Wisconsin Farmer R. W. Lamb & Son, Janesville, Wis., start their advertisement offering five Short-horn bulls for sale. This name may not sound familiar to many of the Short-horn breeders, though the senior member of the firm has been breeding registered cattle since 1893. He started with the Bates families. They made good for him and he has stayed by them ever since. His original cows were of the Arabella and Duchess strains and many individuals of the present herd are descendants of these cows. The present herd bull is Choice Gift 385962 by Flashlight out of Bright Eyes tracing to imported Beauty. This bull has good scale and is siring a uniform lot of calves. The five bulls now offered for sale are sired by this bull and out of their good milking cows. These bulls are old enough for service and in nice condition for immediate use. They are red in color and good typey individuals. The owners wish to move them at once to make room for the spring crop of calves, consequently they are being priced below their real value. Anyone wanting a bull in the dual purpose class can find something suitable here. Notice the advertisement on this page and write for pedigree and prices. Please mention The Wisconsin Farmer when writing. —Adv.

Wenatchee, Wash.—A large golden headed eagle exhibited by Lee Haight at the Chelan County Poultry Show was given its freedom recently. After circling about town a short time it returned and sought entrance to its cage. It has been in captivity three months. It was captured near Coulee City, having been caught in a trap set for coyotes.

Birch & Thompson's 2d Annual

IMPORTERS AND BREEDERS OF

PERCHERON, BELGIAN AND CLYDESDALE STALLIONS AND MARES

STALLION BUYERS ATTENTION. For the next thirty days we are going to reduce our prices on all of our big young stallions in order to close them out. We have very large bunch of big ton, rugged stallions running in ages from two to six years that must be sold this season, consequently anyone that is looking for a right good one will save money by writing to us and getting our prices and descriptions before buying. We especially have a very strong collection of Belgian stallions, in weight from a ton to 2,300 pounds, from two to five years old, that should be on some good farms the coming season. We also have ten tried sires, Percherons and Belgians, that we have taken in on trade on younger stallions, that we are offering very reasonable.

We are located in north central Iowa on the C. M. & St. P. R. R., midway between Mason City and North McGregor, Iowa. Send 20c in stamps for large horse calendar which shows our main farm and sales stables. Correspondence a pleasure.

POLAND CHINA SWINE.

Martiny's Poland China Boars

15 FALL boars of September farrow, sired by Wisconsin Jumbo, the 1st prize and Jr. champion boar at the Wisconsin State Fair, 1914. I believe he was the biggest boar of his age shown that year, he weighing 510 pounds at eleven months old. This will be the last chance to get a herd header from this great boar. The wise man will raise a few fall pigs this year if he never did before. I will sell these boars now for less than they will bring for pork after you get through using them next fall, as I wish to make room for my 100 spring pigs I already have on hand.

L. P. Martiny **Chippewa Falls, Wis.**

POLANDS

HAVE some fine fall **BOARS** to be sold at **BARGAIN PRICES** during the next month. Write. Everything guaranteed.

HE FEELS FINE

CURRENT EVENTS

THE American troops in Mexico will probably be withdrawn within the next thirty days. This is the general understanding, following the recent conference at El Paso between Gen. Hugh L. Scott, chief of staff of the United States army, and General Obregon, minister of war of Mexico. The conference lasted several days. It began by General Obregon demanding the immediate withdrawal of the American troops, but General Scott lost no time in convincing him that this was not contemplated by the United States nor would it even be considered until a much better semblance of peace had been restored in northern Mexico. On assurance from General Carranza that the bandits are dispersed, the northward movement of American troops will attain full speed and it will not be long until the last trooper crosses over the international boundary line. After the conference had adjourned General Obregon issued the following public statement: "As a result of the conference yesterday with General Scott the atmosphere seems now completely cleared up. There is a much better feeling between Americans and Mexicans and all tension seems vanished." There have been several brushes recently between the American troops and the Mexican bandits, but no official word has been received as to the whereabouts or condition of Villa or any general engagement which could be considered as being decisive.

THE uprising of the Irish rebels, at Dublin, was short lived and disastrous. After capturing and barricading themselves in the Dublin postoffice and entrenching themselves in one of the public squares, the rebels were driven out by bombs and grenades, after a heavy loss in life, so that within a few days the uprising was completely crushed by the authorities. The general postoffice was burned down and considerable property damaged before the affair was brought to an end. Fully 1,000 prisoners were taken at the last, among them being a countess who has always been one of the leaders of the rebels in Ireland. It was expected that the disaffection would spread throughout the entire country, but it seems to have been confined to Dublin, for the most part. There are numerous reports to the effect that the outbreak was caused, or aided, by German influence and that the plans were laid here in the United States. The exact truth has not yet been disclosed. The Irish problem was a serious one to Great Britain when the war broke out, two years ago next August, but since that time the Irish have put it away, enlisting in large numbers to fight for the Union Jack. The rebels took advantage of a time when there is considerable dissatisfaction because of the proposed conscription policy, but their uprising availed them nothing and cost many lives.

PREMIER ASQUITH announced last week that the English government had at last agreed on a bill for immediate general military compulsion for the duration of the war. This is the first time in history that England has adopted such rigorous methods in order to insure a sufficient military force. In announcing the plan Premier Asquith added that the needful men could not be obtained by the existing machinery, but that they were available and could readily be spared by the industries essential for the successful prosecution of the war. Having given interesting details of the nation's success in its prodigious effort in raising 5,000,000 men for army and navy, the premier expressed confidence that the bill proposed would end, once and for all, the prolonged controversy, and, in a general statement of the war situation, challenged the house to indicate if the government had lost the country's confidence. A restricted conscription bill has been in effect in England for some time, this being the first time, likewise, that England has resorted to such a measure. Only two general classes were exempt; those engaged in occupations absolutely necessary to the welfare of the empire and those who had conscientious scruples against war, overbalancing their patriotism and the need of their country for their services. The general compulsory service law will remove even these exemptions henceforth.

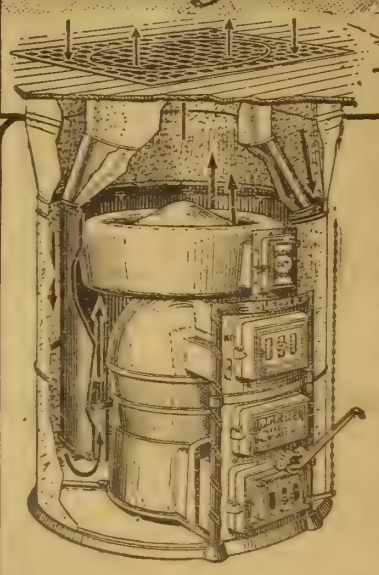
APPROXIMATELY 100,000 persons employed in the various trades in New York City are now on strike and thousands more are threatening to quit work unless their demands are met. The labor situation is said to be more critical in New York than it has been for many years. With shipping virtually at a standstill, owing to the walkout of engineers and firemen employed on tugboats and lighters and the garment industry almost completely paralyzed by a lockout and strike, employers generally declared that not in many years had labor conditions here been so chaotic. One of the remarkable things about the strike is that there has been but little rioting or disorder, the strikers being peaceful for the most part. The effect to industry in general, however, is undoubtedly severe.

THE British suffered a defeat in their campaign against the Turks, when the army commanded by General Townshend was obliged to surrender after a siege lasting 143 days. The British campaign had as its chief aim the capture of that ancient city. To divert Turkish forces from Gallipoli was another object. When almost at the point of achieving its main object last year, the effort broke down eighteen miles from Bagdad, when the Turks, alarmed for the safety of the town of fabled memory, rushed up reinforcements, inflicted a defeat upon the British, and compelled their retreat 110 miles down the Tigris to Kut-El-Amar, where the Turks soon had them securely bottled up. General Townshend held out for 143 days, his supplies steadily growing lower as he awaited the relief army which battled its way up the Tigris toward him. This army encountered strong positions of the Turks, and, although several of these were carried, it was unable to work much closer to the beleaguered garrison than a score of miles. This is one of the few instances within the last 100 years when a British army has had to surrender in its entirety and is unquestionably a severe blow to the pride, even if not to the cause, of England. The army which surrendered numbered about 10,000 men.

THE administration's fight for the Philippine bill, with its amendment authorizing independence for the islands within four years, was defeated in the lower house of congress by a decisive vote. The house then passed the Jones bill, providing for a greater measure of self-government and carrying a preamble declaring the intention of the United States to grant independence ultimately, but without fixing a date. The vote is looked upon as a great republican or anti-administration victory, inasmuch as President Wilson was strongly in favor of releasing the Philippines within a few years. There is nothing in the body of the Jones bill promising independence to the Filipinos nor anything in any part of it setting a definite time for a declaration of their independence. The preamble merely states that it always has been the intention of the United States government to grant the islands their freedom, and in order that they may be better prepared for it a larger degree of control over their domestic affairs is placed in their hands.

America stands first among the nations in its output of coal, iron and steel, copper, petroleum and silver. It leads, too, in these agricultural productions: Cotton, corn, wheat, oats, apples, hay and tobacco. In gold produced the United States stands second, with South Africa first.

Heats Whole House in Coldest Weather
all from this one register



BY actual use in thousands of homes, the Mueller Pipeless Furnace has conclusively proved itself adequate for all heating needs. A Minnesota user says that his Mueller Pipeless heated seven big rooms comfortably all last winter with temperature averaging 20 degrees below zero.

No flues or pipes to fuss with—just cut one central register into your floor directly over the furnace. Constant circulation of air provides proper ventilation. Easy to run. Burns hard or soft coal, coke or wood. No heat wasted.

MUELLER PIPELESS FURNACE

A real furnace—substantially built from cast iron. Installed almost as easily as setting up a stove. Cleaner, safer and more economical than stove heat; saves you labor and trouble. Goes in any cellar, no matter how small. If there's no cellar under your house, you can easily dig a pit to put it in.

The Mueller gives you more for your money than any other pipeless furnace. Costs one-third to one-half less than pipe furnace or hot water heating systems. Write for our **free** booklet.

L. J. Mueller Furnace Co., 204 Reed St., Milwaukee, Wis.

Makers of heating systems of all kinds since 1857. Can supply you with regular hot air pipe furnaces, steam or hot water boilers and vapor heating systems. Give you honest advice on your heating requirements.

BUY NOW! ONLY 30 DAYS MORE!

If you want to take advantage of my special 30-day proposition and buy Galloway Spreaders, Cream Separators or Gasoline Engines at the lowest prices they've ever been offered **you must act quickly.** 30 days are all you have left. May 31st is positively the last day. I repeat the offer briefly. For a limited time—until May 31st—I am making a special proposition to the first ten or more men in each township, as a **special advertising proposition.**

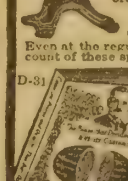
10,000 GALLOWAY ENGINES

Galloway engines are so far ahead of other engines that one invariably sells from two to six more in each neighborhood. For that reason I can afford to CUT THE PRICE of the FIRST TEN INTRODUCTORY ENGINES sold because of the great number THEY will sell. I'm doing the GREATEST ENGINE BUSINESS in the country. But I'm not satisfied. I want to treble it. I want to sell 10,000 ENGINES during the 30 days up to May 31st, and I have taken THIS WAY of doing it.

$26.75 UP

10,000 GALLOWAY SANITARY CREAM SEPARATORS

What I have said of my engines also applies to my Sanitary Cream Separators. YEAR BY YEAR my cream separator business has GROWN BY LEAPS AND BOUNDS. I've SAVED FARM FOLKS MONEY and in return they've TOLD THEIR FRIENDS. These friends have BOUGHT, SAVED MONEY and told their friends until my separator business has reached the point WHERE IT IS ENORMOUS. If you are not acquainted with the Galloway separator, send for my free catalog. Read it over. Then order one of these machines BEFORE MY 30-DAY OFFER EXPIRES.

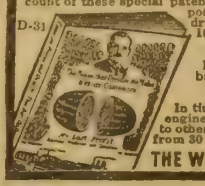


$34.50 UP

10,000 GALLOWAY MANURE SPREADERS

I have also included my New No. 8 LOW DOWN Manure Spreader in this 30-day offer. Even at the regular price this spreader is WORTH $55 MORE than any other spreader made, on account of these special patented features, exclusive on Galloway. All-steel beater and V-Bar; positive roller feed; patented automatic push board; double chain drive; cut-under front trucks and pressed steel unbreakable tongue. It has no equal at any price. Order one on trial.

$64.75 UP



D-31

5 LIBERAL BUYING PLANS

I will sell on terms to suit you—all cash, half cash and half note, bank deposit, full note settlement or on the installment plan.

GET THIS BIG NEW 1916 FREE BOOK

In time to take advantage of our cut price offer. It tells all about Galloway engines, separators and manure spreaders. It shows why THEY ARE SUPERIOR to others and also how we can give you BETTER MERCHANDISE and still save you from 30 to 50 per cent, not only on farm machinery but on clothing and house furnishings as well.

FAMILY CIRCLE TALKS
BY THE PUBLISHER

THE GASOLINE ENGINE IN WAR.

IT IS the irony of fate that the one thing which, more than any other, has increased man's productiveness in the last ten years should likewise be that which is proving his most deadly enemy. I refer to the internal combustion engine.

If I were called upon to name the one thing which has done the most in recent years to increase man's efficiency on the farm, to make his work easier and to enhance profitable production, I would have no hesitancy in naming the gasoline engine, in its various forms. Gasoline is the new hired man of the farm, and well and faithfully is it performing its duties. Scores of farming processes which formerly taxed man's energy to the limit are now being carried on by gasoline engines, which not only do the work better than it was formerly done (so laboriously) by hand, but also give the farmer the time and strength to devote to other and more profitable processes, thus saving him physically and enriching him financially. If this were not so would we find a million gasoline engines, of an average of five horse power, in use in the United States today? Farmers are not adopting machinery which does not serve them faithfully and efficiently.

Yet, in view of all this, have you ever stopped to think that it is the gasoline engine which is exacting the most frightful toll of human life in the war-mad countries of Europe today? How do we find the gasoline engine manifest there? Not in machines which increase man's productiveness, but in engines of destruction: Aeroplanes and Zeppelins, dropping their death-dealing bombs on women and children; automobiles and trucks, bearing their frightful loads of munitions of war; submarines, sent at a terrific pace through the water to their shining mark by the gasoline engine, with the lives of thousands of innocent ones, aboard the unsuspecting liner, at stake on the efficiency of that engine. It is the irony of fate, I repeat, that that which was devised and perfected to augment peace and prosperity should be diverted and perverted to a use exactly contrary to the purpose of its creation.

Secretary of State Lansing recognized this condition of affairs recently when he said, speaking of the manner in which the present struggle of the great empires of Europe is shaking international law to its foundations:

If I was asked what was the chief cause of the new conditions and changed method of land and naval warfare, I would unhesitatingly answer the invention of the internal combustion engine. It has made practicable the motor car, the submarine, the aeroplane and the dirigible. It has made surprise almost impossible on land and it has vastly increased the possibility of surprise at sea. The change of conditions which this invention, aided by the telephone, the wireless and the camera, has brought about is comparable only with that which was wrought by the invention and use of gunpowder. These new conditions offer to the student of international law a field of speculation which is at once attractive and difficult.

Wheat fields given over to carnage, harvest fields drenched with human blood, gasoline engines intended for production venting their force in destruction—could any greater contrasts exist, could anything more forcibly impress upon our minds the awfulness, the wastefulness of war? So long as I have breath left in my body I shall decry and denounce those things which make for war, those people who would have us forsake the paths of honorable peace. Shall the gasoline engine, wonderful servant of man that it is, be taken from the fertile fields of America and devoted solely to the taking of those human lives for the betterment of which it was devised and intended? Never, if I can prevent it.

GRANGE VS. CLUB.

A VALUED subscriber, Mr. G. H. Guthrie, of Kirkville, Iowa, raises the interesting point that as long as there are national organizations of farmers, with their local branches, the need of farmers' neighborhood clubs is minimized. He says:

I would suggest that you recommend the grange to farmers where they want an organization, as the grange covers all the features of a club and also is both statewide and nationwide in its scope. Farmers' clubs are all right as far as they go and I am glad to see the farmers taking an interest in them, but as long as we have a national organization why start another? Clubs of one locality have no connection with those of other localities, while the grange has a national constitution and binds farmers together all over the country.

Here is a good subject for discussion. Will my friends write me, giving their experiences with both local neighborhood clubs and the National Grange, so that we may see if the two conflict in any manner or if there is not room and opportunity for both?

MORE SWINDLING SCHEMES.

WHILE holding firmly to my original statement (made in these columns a fortnight ago) that the farmer is a harder man to swindle today than the average business man in the city, I am surprised at the number of letters I have received since the publication of my article in regard to the concrete-fence-post-mold scheme. It begins to look as though there were more men thriving on the credulity of their fellows than I thought. But all my correspondents agree that we can drive the swindlers to cover by publicity, so I shall do my share while the subject is fresh in our minds.

"A little warning may be good for our weaker and less-informed brothers," pertinently remarks one of my correspondents, narrating how a similar scheme was worked on his father several yars ago, not with concrete molds, but with wire fence machines, worth about $2, but which the farmer-agents must sell for $10 in order to get back the money they had paid out to secure a valueless "agency." Most of these "get-rich-quick" men who are fleecing the farmers nowadays are working under the cover of the law; they are slick enough to see to it that there is no real downright swindle in their plan on which they could be arrested and brought to justice. Usually they work on the vanity of some farmer—telling him he has been selected because he is prominent in the community and his indorsement will sell the article quickly—or his cupidity, and then leave the neighborhood before the victim wakens to the fact that he has given a perfectly good note for what is, at best, a long chance on ever getting his investment back, let alone making any money. Let me quote somewhat at length from one of my correspondents:

In reading the article, "A Slick Scheme," in your paper I was reminded of the old saying, "There is nothing new under the sun." This same scheme was worked years ago to my knowledge, not with post molds, but with wire fence machines, possibly by the same men. It was the same story—a dozen small, cheap machines for a price that would not let them sell. In other words, a $2 machine to sell for $10. And the would-be agent would find on second thought, or on trying to sell a few, that no farmer would pay $10 for a $2 machine that he might never use. The swindlers would be back in a few days with lots of flattery, "the agent was a man among men and should be promoted to take charge of the whole county with prospects of lots of money from dozens of agents working under "him," and so on. Of course this general agency, as it was called, meant another contract and more notes to initiate you into the Order of Fleecers. And then the farmer would find out that he didn't have the ability or the heart to go out among his own people and start collecting notes from them. I guess that ended the matter except, of course, going to your home banker and paying the notes. The main cry of these men was that they meant business, all they wanted your note for was to show your good faith, as they would be soon shipping you many dollars' worth of goods.

Previous to this the country had been worked by "gate" agents who sold territory at large figures. The patent gate was good of itself. You opened and shut your gate from your rig, but they were not selling quite so much gates as territory, and I knew men to buy territory in distant states where they found, upon investigation, that fence was needed worse than gates. I also knew a farmer to get in with an agent and travel and try to sell his brother farmers a certain article for about ten times what it was worth on the claim that this article would last indefinitely while other smaller articles would soon wear out. The farmer with the agent had "bought" one, of course, and, in turn, was to get a rake-off for any they could sell. To show that he had bought one the agent required him to give his note for the full amount. The idea was to help sell goods by showing the note. The farmer had an understanding that he was to get the note back, but no sales were made and the farmer did not receive his note back, but afterward paid it.

I earnestly trust that by giving these men this publicity the great body of farmers the grain belt over may be saved from their nefarious schemes. As a general rule it is best to eye with suspicion any flattering offer made by a stranger or, at least, to postpone final action until there has been time to think the matter over or to talk it over with neighbor or wife. Signing a note and giving it to an utter stranger is a serious matter and should never be done without investigation and reflection. We are so accustomed to hearing that opportunity knocks but once, many of us are straining our ears for the knock and mistake many other sounds for the rap of fickle fortune. It might be better in the long run to be altogether deaf to the sound than to be taken in by miscellaneous "get-rich-quick" schemes which leave us poorer rather than richer and subject us to humiliation when the story of our affair gets abroad in the neighborhood.

THEY SERVE WITHOUT PRICE.

THE gasoline situation is improving, for which the farmer with an automobile or a gas engine is duly thankful. Not that the price has actually gone down in many places. But, on the other hand, there has been no increase for two months now, and if I am any prophet the grain belt is not going to see gasoline much, if any, higher the entire summer than it is now.

It would be difficult, if not impossible, to give any one reason for the price not advancing, as was feared and predicted. Perhaps the market manipulators have come to the conclusion they have gone as far as would be healthy for them. Perhaps the fact that congress and the department of justice appear to be in real earnest in their investigation of prices has deterred them from killing the goose that lays the golden egg. Perhaps the fact that a score of inventive geniuses are working day and night in a frantic attempt to find a substitute for gasoline has caused them to foresee the day when their monopoly might come to an end. But, over and above all, in my opinion, is the fact that, in the emergency (as so often happens in the United States), relief appears to be in sight as the result of the efforts of a man who puts the common good above any question of personal profit and advancement.

Let me digress just a minute to call your attention to one or two similar instances in our agricultural annals. It is only a few weeks ago that the great state of Wisconsin paid deserved homage to a man whose invention has caused dairying to advance (among the profitable branches of general farming) by leaps and bounds. The value of the services to the agricultural world of Dr. Stephen M. Babcock, inventor of the Babcock milk test, cannot be computed in dollars and cents. Dr. Babcock would have been a millionaire many times over, had he accepted only a small royalty from each machine manufactured. Yet because he knew his invention was for the public good, he relinquished all claims to wealth, giving it to the public that farming might become more profitable. Millions have waxed rich, with their dairy herds, because of what Dr. Babcock did for them, without price.

A short time ago another great state, Iowa, announced the invention of a machine which it is believed will solve the vexatious problem that has long beset the farmer who plants the seeds of certain legumes. A scarifying machine which scratches the hard surface of these leguminous seeds, thus increasing or quickening their germinating powers, has been given to the farmers of America by the man who invented it. Like Dr. Babcock, he might have waxed rich on his invention; but, like Dr. Babcock, he unselfishly put fortune behind him in order that the rank and file of farmers might profit and the production of millions of acres of American fields might be increased.

These and similar instances come to my mind as I stop to size up the gasoline situation today. Just when the situation seems most serious, a government chemist, Dr. Rittman by name, announces that he has perfected a device which will increase gasoline production from 15 to 45 per cent of the crude oil used. Such an invention is worth more than its weight in refined gold; with the immense demand for gasoline the world over, it is almost priceless. Yet Dr. Rittman has given his invention to the government, and last week congress took the necessary steps to accept it and to devote it for all time to come to the use of the public. Shall we not honor men who do such noble work as this, unselfishly putting aside the great chance to enrich themselves, serving the public in its hour of need, devoting their unusual gifts to the greatest good of the greatest number?

Gasoline has become one of the necessities of the age. We could hardly maintain our present standards of living and our present record-breaking production without it. Do we not owe a great debt to anyone who makes it possible for this wonderful motive power to remain within reach of us all, turning the wheels upon which depend our pleasure and our prosperity, the continued production of our fields and the plenty which makes us take front rank among all the nations of the earth?

James M. Pierce

THE WISCONSIN FARMER

A WEEKLY JOURNAL OF AGRICULTURE, HORTICULTURE, STOCK RAISING AND ALLIED INDUSTRIES

BY JAMES M. PIERCE

JAMES ATKINSON, Editor-In-Chief

ESTABLISHED IN 1848

Entered at Des Moines Postoffice as second-class matter

PUBLISHED EVERY THURSDAY

1912 Grand Ave. Des Moines, Ia. | 201 Washington Bldg. Madison, Wis.

To either of which communications relating to subscription or advertising may be addressed.

MEMBER AGRICULTURAL PUBLISHERS' ASSOCIATION
MEMBER AUDIT BUREAU OF CIRCULATIONS

SUBSCRIPTION RATES—Single subscriptions, $1.00 a year. In clubs of ten, 75 cents a year and an extra copy to getter up of club. In clubs of fifty or more, 25 cents a year. Single subscription three years in advance, $1.50; five years in advance, $2.50; ten years in advance, $5.00. Subscription prices in Canada, $1.50 a year. Remit by draft, registered letter, postoffice or express money order. In changing address, send both the old and new addresses. In renewing, give the same name and initials as you gave before or state both the old and new names, and explain why you make the change. In case of errors or failure to receive the paper within two weeks, promptly notify the publisher. Address WISCONSIN FARMER, MADISON, WISCONSIN

Effort to Revive Wisconsin Holstein Breeders' Association.

IN ANOTHER column of this paper will be found a report of the meeting of the Holstein-Friesian Breeders' Association of Wisconsin, held last week in Watertown. It has been the custom of the association to meet once a year at some Holstein center, enjoy good speeches and a banquet, and return home to forget all about it. A few of the faithful have been keeping up annual dues. But the fee of $2 a year, paid by only fifty to 100 of the 1,200 members, has been insufficient to supply the secretary with printed matter and postage, and allow any appropriation for active work. In brief, the members have been paying $2 annually for the privilege of belonging to a club of good fellows. They got no real service for their money. The association had no well-defined plans. The majority of members, being unable to attend the annual meeting, have failed to become enthused concerning the work of the association.

Lack of interest has been particularly noticeable in the matter of representation in the Holstein-Friesian Association of America. Two years ago at Chicago, Wisconsin breeders should have dominated the association meeting. Instead of doing it they sent nearly 600 proxies to eastern breeders. In the event of a clash of interests on any topic the easterners had the votes. This was largely due to the fact that no one took sufficient interest in the Wisconsin association to worry about it. An effort has been made this year to get proxies, but less than 300 had been collected up to last week. It is no less than a month until the national meeting is held in Detroit.

The statement has been made that co-operation among farmers is dependent upon the farmer getting some service for his investment of money and time. Members of the state association admit that they have not been giving the breeders of the state much service, and they now propose to remedy the situation. The plan as outlined in another article on page 10, provides for issuing a book which shall be the official Holstein-Friesian directory of Wisconsin. First of all the plan, if successfully carried out, will furnish money; second, it will give at least some advertising service to the persons who subscribe; third, if the book is properly gotten out and is representative, it should create a favorable impression of the dignity of Holstein interests in Wisconsin.

The mere publication of a book is not going to set the world on fire for the Holstein breed. Those who advertise in the book should not expect to get many direct returns in the way of sales. The book has a big value because it will be the only ready reference Holstein directory for Wisconsin. It will give names and post office addresses and the number of cattle each breeder owns, also those which have been under A. R. O. test.

To be of greatest value the new directory should contain the name of every one of the 1,200 members of the association. The danger will be that the big fellows will get into the book and the little fellow will be out of the active work of the association, as they are out now. However, there must aways be leaders in work of this kind. Often one or two good men have to do all the work. The number of subscribers to the fund will increase or decrease each year as the value of the book is proved or disproved.

The Wisconsin Farmer does not wish to go on record at this time as affirming that the book plan will revive the state Holstein association. This state has more than $30,000,000 invested in Holstein cattle and it should not be necessary to resort to this method to make a state association a success. Most of those who will support the book would support any other plan which had the same object. Our hope is that the loyal band of workers now connected with the association will be able to enlist also the rank and file. And our advice to the rank and file is that they are making a great mistake in not supporting the state association. Rather than make it a primary objective, we should say the book plan should be only an incident. The world is calling for better dairy cattle at this time. Mr. O. E. Reid, of Kansas, a bidder at the Watertown sale, said that 90 per cent of the Kansas farmers who want better stock want Holsteins. This is indicative of a splendid market. Iowa and Minnesota and the Dakotas can use thousands of pure-bred Holsteins. There are yet thousands of farms in Wisconsin which have not been graced with the presence of the pure-bred Holstein. There are other farms where scrubs hold sway. Every proper method should be adopted to emphasize the importance of pure breds in dairy herds. In this effort the proposed book will undoubtedly help. The agricultural press, while it will not be able to give one breed special prominence over all others, can well afford to bring out the strong qualities of the pure-bred Holstein. The breed papers will be glad to help; and above all things these matters designed to help the breed should not be bottled up for the benefit of the few, but should be of such nature and scope as to create an advantage for all breeders, big and little, in this great Holstein state.

Holstein breeders should get behind this book plan, with the hope that it may be simply an incident leading to bigger things.

Enforcing the License Law in Wisconsin.

MR. C. E. Lee, with the State Dairy and Food Commission, reports that the commission won out in the recent test case on the new Wisconsin license law. Mr. Lee called upon the operator of a butter and cheese factory and found the place in an unsanitary condition. He notified the operator that the permit to operate a butter and cheese factory, as well as his buttermaker's permit would expire April 8th. This same man had previously been prosecuted and fined for maintaining a factory and utensils in an unsanitary condition. The arrest and fine did not seem to have the desired effect. According to reports on file in the office of the state dairy and food commissioner, this operator returned to his place of business with no better standards. The closing of the factory involved a considerable loss to the owner. There were about 100 milk and cream producers affected. Notice of closing, however, had the desired effect, and in place of paying another $25 fine and costs, an investment of $29 was made for paint. Mr. Lee reports that this factory has been thoroughly cleaned. The churn, ripener and vats have been cleaned with a white coat of paint. Then the attic where the whey and buttermilk tank is kept has been whitewashed. The curing room has been cleaned and whitewashed. The ripener has been retinned and new metal followers have been ordered. The oil engine and boiler have been removed from the factory make room, and other minor improvements are being made. When it came to a show-down the operator was not only willing but glad to make the changes. He is reported to have written to Mr. Lee as follows:

I did not realize the condition of my factory. It is an easy matter to let things slide, but from now on a new standard will be maintained. If I had been prosecuted, it probably would have been the same old story as before. Tell Mr. Weigle that he and his inspectors will find my factory clean and sanitary any time they may care to call, in the future.

It is difficult to estimate the value of such work within this one Wisconsin community. It was certainly an eye opener to milk and cream producers. The farmers who now visit the factory are delighted at the change. Two farmers who visited this factory recently asked where they could secure information regarding the construction of a sanitary milkhouse. Other farmers have determined to clean up their barns and whitewash more frequently.

The new license law contains this clause:

An operator's permit or license and at least one copy of the rules and regulations of the proper methods of operating butter and cheese factories shall be conspicuously displayed at the factory.

Farmers who do not find these rules so displayed should ask the operator to put them up. Factory operators and makers should study the rules and regulations. It is a poor idea to wait until a representative of the Dairy and Food Commission comes along.

Wisconsin Man Discusses Milk War.

MANY Wisconsin people are interested in the recent milk war won by farmers near Chicago. Mr. George F. Comings, of Eau Claire county, writes The Wisconsin Farmer that the culmination of the Chicago milk war was a "victory won for justice, American manhood and the American farm home." Attention of our readers is called to a special story on this milk war, written by one of our editors who visited the scene of the conflict and who tells the story first-hand.

Referring again to Mr. Comings' letter, we quote the following:

For twenty-five years it has seemed to the writer a self-evident truth—an axiom—that if laborers and capitalists organize the farmers must do so or their name is "Dennis." They have only begun the good work and it should be vigorously pushed forward. On our own farm for more than a dozen years we have produced and retailed milk and cream to a very nice city trade.

Our experience is that if milk is charged to the wagon in bulk at 4½ cents per quart and 25 per cent cream is charged at 20 cents per quart and is bottled and delivered at 7 cents per quart for milk and 30 cents per quart for the cream, that the wagon end of the business is the one with very much the larger per cent of profit. (And ours is a herd of large producing Holsteins.)

To put the proposition another way. If one should invest $4,000 to $6,000 in three delivery rigs, milk and bottling house, ice house and all the paraphernalia required to run a retail business in nice shape, and had a business of the size, say of 800 quarts of milk and fourteen gallons of cream delivered daily, which is proportionate to the business done by our wagon for many years, in a small city like ours, he would make a much better per cent on the investment and earn a much larger salary than any dairy farm can pay in producing these goods at the prices named above.

In fact, I think if the milk was charged at 5 cents per quart and the cream at the price mentioned that a retailer will make more than the producer.

The farmers ought not to sell good, clean, 3½ per cent Holstein milk at less than 4 cents per quart at their door.

It makes my blood boil to think of the arrogance of the distributors in posting the prices they will pay for a six-months' period. Such things might pass in Russia, but should not be tolerated in America.

I should think the farmers' hearts would beat with joy that the mighty, the rich, the powerful, have been obliged to acknowledge that it takes two parties to make a bargain.

Mr. Comings is former proprietor of Silver Spring Farm in Eau Claire county. He has had a great deal of experience in dairying. His sons are now conducting the farm.

When the farmer-dairyman comes to the point where he understands his own business, and keeps books on it, as we have no doubt Mr. Comings has, he will be in a better position to demand his rights. The big concerns of which Mr. Comings speaks know to a penny every month just what profit has been earned. They know what expense has been incurred. They know how to get more money in case they are not satisfied with the profit. What facts does the average farmer have to present? Does he know what each cow is producing and the test of the milk? Does he know the cost of the feed and labor? As a matter of fact does he really know whether he is making or losing money each month on his milk sales? Covering a period of years he may be certain whether he has accumulated wealth by paying for his property, by adding to his herd, by buildings, or by money in the bank, or whether he has accumulated mortgages upon which it is hard to pay the interest, buildings which are rotting into decay, and unpaid notes at the bank. When farmers know certainly their costs, and have some system of comparing them with receipts and of striking a weekly or monthly balance which will be fairly accurate, we will be nearer the time when farmers will insist upon a reasonable profit for their investment and labor.

Certified Wisconsin Potato Seed.

MORE certified potato seed will be grown in Wisconsin this year than ever before, as the potato growers are learning that it pays to produce standard, healthy seed, and buyers have discovered it pays to buy such seed. There are many things to be said in favor of certification, which was begun only a few years ago in Wisconsin, and the following advice given by Mr. W. D. Juday, county agricultural representative of Oneida county, which county won first prizes at the state and national shows last fall, is of value to every potato grower in the state:

Certification should be considered both from the buyer's and from the producer's standpoint.

The buyer wants his seed potato stock to be variety pure, free from serious disease, fairly true to type and reasonably uniform in shape. He is generally buying from men concerning whom he knows little or nothing, men who do not always give him the quality of seed he rightly expects. For this reason he welcomes a system which will reasonably assure him that he is getting what he pays for; and for this assurance he is willing to pay a little premium.

In viewing certification from the farmers' standpoint we can readily see that all potato growers do not want and should not try to get certified seed. Certification is for the man who is willing to treat his seed, spray with Bordeaux mixture, pull diseased and mixed hills from his field, exhibit at fairs and potato shows and sell only well-graded stock of his own growing. A grower with a less ideal should not attempt it.

The next question is "How much of a premium is the farmer to get for all this trouble?" A reasonable charge is fifty cents per bushel above market price for the well-sorted stock. Charging exorbitant prices will tend to make certification unpopular with the prospective buyer and discouraging to the grower.

A farmer should consider too that part of the benefit derived from certification comes in the form of increased yield and added ability to grow a better crop. The practices desirable for certification are practices which will always give more bushels of better potatoes to the acre. Even for table stock, a better price can be obtained from this grade than for the average sort.

Farmers receiving certification also get valuable information concerning the different phases of the potato game. They are shown diseases that they did not know were in their fields and at the same time given methods of control, the best cultural practices are taken up with the inspector, new potato problem discussed, and plans for grading, exhibiting and advertising talked over. In short, the services of an expert are possible for every applicant. All the farmer has to do is show his willingness to learn.

The scope of certification is limited. It carries with it a personally responsibility and must, therefore, be an individual rather than a community affair. It is now established on a sound basis and each farmer should strive to keep it so, by having field conditions right by practicing a strict grading on the field or in the bin, and by offering his product at a reasonable quotation. The measure of its success will depend upon the number of satisfied customers. The ideal should be to carry on the work so that it will be a profitable protection both to the buyer and to the seller.

The prices have been slightly increased for the inspection service this year in order to make it

self-sustaining, but the advantages gained by the growers of seed in securing certificates far more than offset the cost of the inspections. More than a hundred growers received certificates last year and indications point to an increased acreage this year.

Wisconsin Surplus Stock Disappearing.

THE writer took particular pains to ask breeders at the recent Lake Mills and Watertown sales whether there still remain any considerable amount of good dairy stock for sale in their neighborhoods. Apparently the surplus which was talked of a few weeks ago is rapidly disappearing. There is a splendid demand for good grades with the supply about exhausted in the dairy breeds, and a good demand for pure-bred stock with the supply diminishing. More stock has gone to the Southwest this year than ever before. in the opinion of leading breeders. Former Governor Stubbs, of Kansas, was a bidder at both the Watertown and Lake Mills sales, and he is authority for the statement that Wisconsin may expect many purchasers of dairy stock from Kansas in the near future. Mr. O. E. Reid, of the Kansas State Agricultural College, Manhattan, said in an address at Watertown that 90 per cent of the Kansas farmers who want dairy stock want Holsteins. This big percentage will probably not be maintained through other territories. There is a splendid demand for good Guernseys and for other fancy Wisconsin dairy stock.

Because of the poor shipping conditions the past two years it had been anticipated that there would be a considerable amount of stock for sale this spring and summer. A good deal of the stock held through last fall and winter, however, had been sold and was shipped as soon as the restrictions were removed. The fact that there had been some falling off in purchases led to heavy private sales this spring. Prices at dairy stock sales thus far have been generally good, the averages being in the main quite satisfactory. Good breeding has told more than ever this year in the sales, and the topliners have been in every instance those backed by records and pedigrees.

One breeder estimates that there have been 5,000 dairy stock shipped out of the state since the removal of quarantine. It is likely that this is high, though the sales have been heavy and probably more than 3,000 pure breds have left the state. This is an estimate, however.

With diminished stock no slump in prices is expected this season. Good individuals are selling up well in all divisions of live stock, and a successful season is the result.

Seventy-five Thousand Autos in Wisconsin.

ON MAY 1st licenses had been issued in Wisconsin for 75,747 privately owned automomiles, which is within 4,000 of the total number of automobile licenses issued for the entire year of 1915. It is expected that by May 15th the 1915 record will have been passed and a new high-water mark set for Wisconsin. With the same ratio of increase for the remaining eight months of 1916 that prevailed during the same period in 1915 over 1914, Wisconsin by the end of the year should have at least 125,000 automobiles in private hands. This is one of the many signs indicating prosperity which is more manifest this spring than ever before in Wisconsin. It has been figured that the automobiles in this state average $1,000 each, which means that the grand sum of $75,000,000 is now represented. As more than 45 per cent of the autos are owned on rural routes, according to estimates of the dealers, it is evident Wisconsin farmers have the buying power and are spending their money.

Wisconsin Rennets Are Needed.

EVERY Wisconsin dairy farmer interested in the welfare of any cheese factory should make an effort, especially at this time, to see that no rennets are wasted in his community and that those saved go into the proper channels for the making of rennet extract. Such vigilance will not only assure the farmers that their cheese factories will be able to continue to operate but will add an additional source of income, as leading rennet manufacturers in this country have for more than a year offered as high as 12 cents apiece for them when properly prepared.

Something like a million and a half calf stomachs are used annually in the United States by its 5,000 cheese factories. These yield about 100,000 gallons of rennet extract. In the past the supply of rennets, as these calf stomachs are called, came from the European countries, but with the war affecting this industry it is necessary for the manufacturers to look to this country for its supply. Wisconsin, being so largely a dairy state and at the same time the nation's largest producer of cheese, is therefore very directly affected, as a continued shortage in the supply of rennet extract may compel many factories in the near future to close. One of the leading factories making extract in America is located in Wisconsin, and by seeing that rennets are saved and turned into the proper sources the dairyman not only is aiding in filling a need, but is also deriving an income from a product otherwise wasted.

Attention to the condition of the rennet extract market is called by J. L. Sammis, of the Wisconsin Dairy School, who points out the need of Wisconsin rennets. It is now difficult for any dealer or cheese factory to obtain more than ten gallons at a time, and frequently not more than one or two gallons. Ordinarily, factory patrons are careless about saving rennets or in seeing that they are saved by the local butchers, but existing shortage, brought about by the war, makes it imperative to develop and utilize more fully the resources at command in this country. Mr. Sammis says that as an inducement to get factory operators and patrons to aid in the collection of rennets, it may be necessary for extract makers to supply extract at market prices only to those factories which furnish rennets in good condition in exchange.

The stomach of a calf gives the largest amount and the best quality of rennet extract if the calf is slaughtered before it has eaten solid food, and when hungry for eighteen or twenty hours since last fed. If left hungry longer, the stomach becomes congested with blood, and gives an inferior product. Calves shipped a long distance on the cars are apt to try to satisfy their hunger with the straw, refuse, etc., on the floor of the car, and such stomachs are often found to be of inferior quality for making rennet extract.

As soon as the calf is slaughtered the stomach should be removed and taken care of at once. The fourth stomach, which is the rennet, is cut off at its wide end as close as possible to where it joins the next stomach called the book. About two inches of the thick muscular neck at the narrow end of the rennet should be cut off, as it is of no value. The contents should be squeezed out, and any fat on the outside peeled off. It should not be washed with water, but may be slit open with a knife, stretched well, salted heavily on both sides, and put in a cool place for a day or two to drain. Plenty of salt must be left on both sides. When well drained so as to not leak brine in shipping, the rennets may be counted, packed in a box or bag and shipped by express to the manufacturer of rennet extract who buys them. Or the salted and drained stomachs may be hung up to dry where there is a good circulation of air and where they are protected from flies until a sufficient number are collected for shipment.

The European rennets are usually inflated with air, the ends tied, and hung up in a cool, airy place, protected from flies, until dry, and afterward are flattened, tied in bundles, and packed in a box. But the easiest way to handle rennets is to slit and salt them as described above.

Poor Chance in Agriculture Without "Horse Sense."

WE HAVE had occasion in the past to quote from a bulletin prepared by Carl Vrooman, assistant secretary of agriculture, dealing with the question of grain farming in the corn belt with live stock as a side line. Mr. Vrooman, we are informed, is an extensive landowner and he has made an enviable reputation because of the businesslike methods he has applied to the handling of his land. At this time we beg leave to refer to the emphasis which Mr. Vrooman places upon the utilization of what he calls "horse sense." Legumes, lime, live stock, saving of waste, business methods, horse sense—these are the essentials for the highest success in corn-belt farming, and the greatest of these is horse sense, for in a way, it includes all the others.

Without horse sense, there's a poor show for making a real money success of farming of any kind. Without that faculty, otherwise called "business ability," industry, capital, credit, and even a thorough knowledge of the most approved scientific methods of agriculture all will be of little avail. To qualify as a business farmer, a man must have that peculiar sort of "gumption" which enables him to shape his work and change his plans according to changing weather, shifting markets, and up-and-down business conditions. He must be able to decide whether he can best dispose of his crop by feeding or by selling on the market. In selling either live stock or grain the farmer should know enough of the actual value of his product to know when the local buyers are offering him a fair price. To know the actual value of his product he must know the freight rates to market, what commissions, insurance, and other expenses must be met, as well as probable shrinkage, etc., but these are facts that any farmer can easily secure.

It is not enough to grow a good crop, says Secretary Vrooman, or even to grow a good crop at low cost. To make the big crop a business success it must be disposed of as efficiently as it is grown—must be so graded and packed as to meet market standards and so marketed as to bring the farmer the highest current prices.

Moreover, the farmer who is too suspicious to get together with his neighbors in order to do co-operatively what none can do alone is sure to pay dearly for his lack of confidence and his incapacity for team work. The social spirit and a capacity for co-operative effort are fundamental necessities of the new agriculture. The day of the Ishmaelite and the individualist is over. The future belongs to the men who are able to co-operate with their fellows in pursuit of their common interests.

The farmer who sells all his crops at the elevator is robbing his own soil, his own purse, and his own children—selling his birthright for a mess of pottage. The farmer who not only does this, but also burns all his cornstalks and straw, reminds one of the burglar who takes all the valuables he can carry off and sets fire to what is left.

According to figures gathered recently by the department of agriculture, American farmers burn each year $65,000,000 worth of straw. When we consider, in addition to the straw thus wasted, the vast quantity of cornstalks burned, worth, on an average, $3 per acre for manure, and estimated to total in value fully as much as the straw burned, we begin to get some idea of the fertility that goes up in smoke on American farms each year. In exceptional cases it may be found advisable to burn straw and cornstalks. For instance, in order to get rid of insect pests, or in case there is no live stock to consume the straw, nor enough moisture to rot it if it is turned under. But it is safe to say that every year in the United States $100,000,000 worth of straw and cornstalks are burned that could advantageously be used for feed or fertilizer.

A man who fails to make a success of farming because of his failure to apply recognized principles of successful agriculture, or because of his failure to conform to recognized business principles, has largely himself to blame. Success today cannot be gained by slipshod or happy-go-lucky methods. Certain well-known methods produce certain highly desirable results. A man may get a good crop occasionally in spite of inefficient methods. But to get the best obtainable crops and the best obtainable prices for those crops year after year requires a working knowledge of the science of agriculture and of sound business practice.

Need For Modernizing the Farm Home.

WHEN property valuations run into the billions they get beyond the comprehension of the average person. However, when used for purposes of comparison the matter is simplified. It is said, for example, that the railroads of the United States are worth $15,000,000,000 and that they are mortgaged for $11,000,000,000, or 80 per cent of their value. On the other hand, the farms of the United Sstates are worth $40,000,000,000, and they are carrying a debt burden of only $6,000,000,000, or 15 per cent. There are those who are of the opinion that this farm indebtedness can be increased to great advantage by improving the conditions in the average farm home.

This matter was taken up at the last meeting of the American Society of Agricultural Engineers by Xenophon Caverno, who claims that farmers, with a greater mortgage load, could greatly increase their producing power, providing the money is wisely spent. Some of it could be spent to splendid advantage in the improvement of the home, which would contribute immensely to comfort in living, healthfulness and to all-around efficiency of every member of the family.

Mr. Caverno believes that the lot of the farm wife can be greatly improved. On this subject he says:

> The work of the farmer's wife is not only hard and exhausting, it is continuous and practically unvarying. The seasonal changes, which relieve the monotony of the outdoor work on the farm do not penetrate to the kitchen. There is the same lugging of water and slops, the washing and ironing, the sweeping and scrubbing, the filling of lamps and making of beds, the sewing and mending, the care of the children and the everlasting three meals a day. No other class has derived so little from modern progress and invention, in comfort and luxury, in relief from grinding toil, as the farmer's wife. This is a neglect for which the whole nation is paying an awful price in the high cost of living.
>
> Not only has modern labor-saving invention passed the farmer's wife by, modern sanitation has as well. The stronghold of typhoid fever, dysentery, and all enteric diseases is now in the country. Privies and cesspools distribute diseases through the medium of flies and polluted drinking water. An overtired body is not resistant to disease. The personal cleanliness required for health is almost impossible without a heated house, a bathtub, and running water. The chill of unheated rooms, the sudden plunge from the heated kitchen to the pump in the yard, the chill from going to the outside privy in winter, and the poisoning of the system from staying away through dread of the exposure, complete the invitation to disease. An overworked body, the presence of disease germs, the lowering of vitality by exposure, the mental depression from the monotonous routine, this is a combination which few farmers' wives escape. Some have the strength to stand up under it; most of them do not.
>
> We recoil from the concentrated misery of the city slums, of the sweat-shops and factories because it is concentrated. We tolerate the great sum of individual miseries on the farm because they are individual. If all of them could be massed before our eyes a cry of horror would go up to heaven. And behind the pity of it lies the economic waste; the crippling of the one great basic industry of our country on which all others depend. And in the individual economic waste, as in the individual misery, we lose sight of the grand total.

Of course, there are thousands and even tens of thousands of homes in the central West where every modern convenience can be found. The bath tub is no longer regarded as a luxury, but an absolute necessity, and the old-fashioned style of lighting the farm home is rapidly disappearing. The installation of a water system in the home and conduits to carry away the waste has cut down the irksome part of home labor anywhere from 25 to 50 per cent. Here and there families live under the handicap of a poor home equipment, and it is just possible that if these poorly equipped homes were placed side by side as in the cities they would present a condition that would be regarded as intolerable.

We are coming to believe that good health is the greatest asset of all, and that, therefore, no reasonable expense should be spared to cut out the druggery, to supply ourselves with pure water and to provide the most effective means of carrying away waste that might otherwise become dangerous to health.

FARMERS SET MILK PRICE.

Co-operation and Organization Enable Dairymen in Chicago District to Increase Their Receipts $8,000 Daily and Wrest From the "Milk Trust" the Power It Has Exercised For Fifty Years in Setting Prices.

DETERMINED FARMERS AT BATAVIA, ILL., WHO JOINED UNANIMOUSLY IN THE PRODUCERS' DEMANDS FOR A BETTER PRICE FOR THEIR MILK.

FOR more than half a century the prices that the dairymen in the Chicago district received for their milk were made by the "milk trust," but in April, 1916, this custom was reversed and the farmers began setting the price. This came as the result of co-operation and organization of the farmers into the Milk Producers' Association, and its success in the recent fight in the Chicago district demonstrated beyond question that what organization has done for the trades it can do for the farmers.

R. B. SWIFT, PRESIDENT.

The recent "strike" in Chicago when the farmers forced the distributors to raise the price paid the dairymen from $1.33 to $1.55 per 100 pounds is familiar now to most of our readers. By cutting off the supply from Chicago the shippers forced the wholesalers to meet their summer price demands and as a result the Milk Producers' Association, representing about 13,000 farmers, suddenly sprang into national prominence. Prior to this victory the association was hardly known outside of its own district, but from every corner of the land now comes inquiries as to what this organization is; when was it formed; how did it succeed in raising the prices and what have been its experiences that would help farmers in other sections to receive better pay for their milk. Its "stick together" spirit enabled it to upset a custom of fifty years' standing by taking from the distributors their self-inherited power of setting the milk prices and with continued wise counsel and direction it should remain in position to dictate in the future the prices which its farmer members shall receive for their product.

The 22 cents a hundred pounds, applied to the daily milk supply in Chicago, means that the 13,000 dairymen in that district will get $8,000 more each day for their milk than they would have received at the price offered by the distributors. This is an average of about 62 cents a day for each farmer and was obtained entirely because the distributors realized that the farmers meant business and that all efforts to offer "half a loaf" would be futile. "We'll confer, but not arbitrate," was the motto of the association and all efforts of distributors to reach agreements with "ifs" attached and make contracts with many "conditions" written therein failed. One company tried to gain special privilege by agreeing to the April price and offering to arbitrate for the other five months. This was refused, as were all other offers except an absolute compliance with the producer's demands, and resulted in the victory that was proclaimed by the increase to $1.55.

"SCAB MILK" POURED INTO THE STREETS AT CROWN POINT.

Wisconsin's interest in the Chicago situation is twofold—first in the benefits farmers in Walworth, Rock and Kenosha counties who ship to Chicago will receive from higher prices and secondly in the stimulus it will give the dairymen in the Milwaukee district in their efforts to get a better price for their milk. Milwaukee shippers, according to Alfred Fuller, of North Lake, president of the Milwaukee Milk Shippers' Association, will receive $1.10 per 100 pounds during May for 3 per cent milk; $1 during June; $1.25 during July and $1.35 during August, September and October, amounting to about 15 cents per 100 pounds. For months the Milwaukee shippers have been clamoring for better prices and the victory of the Chicago shippers will no doubt place them in a better position to force the distributors to meet their demands. On July 1st the Milwaukee association plans to open in that city a distributing depot of its own for which a company, capitalized at $10,000, has just been incorporated. These plans were under way before the Chicago fight began and Mr. Fuller expects the association to accomplish the same results as the Chicago shippers accomplished only in this different method.

Farmers who, prior to the Chicago victory, scoffed at the shippers' association and declined to become members are now rushing in their application blanks. During the last month W. J. Kittle, of Chicago, secretary, informed an editor of The Wisconsin Farmer every mail has brought in scores of new members until it is predicted that this organization will number among its members every shipper in the Chicago district. Locals are being organized even outside the district in order to help neighboring farmers who are in the district. The power of organization has been demonstrated. That farmers can better themselves by pulling together has been proven and there is now a grand rush to get into the band wagon, all the result of a single victory.

The wonder is that the revolt, as R. B. Swift, of Libertyville, president, calls the recent Chicago fight, did not come sooner. With gluten at $26; bran, $23; cottonseed meal, $36; alfalfa hay, $16, and silage $5 a ton, the Chicago shippers were confronted with the problem of not getting enough for their milk at $1.33, the price offered by the Chicago distributors, to buy the feed needed to produce the milk. For years these farmers have realized the narrowing of their profits, but as individuals they were not able to oppose the big distributing corporations

W. J. KITTLE, SECRETARY.

and at each semiannual contract making had to submit to the prices offered.

This year, though, the time seemed ripe. The Milk Producers' Association, which was organized in February, 1909, had grown to be a large, influential organization. No surplus milk could be found anywhere; the spring supply bid fair to be short; storage warehouses were cleaned of their butter; cheese had reached the wholesale price of 19 cents; casein was up from six and a fraction to 23 cents a pound. With all these conditions favoring the farmers and an organization behind them, although its strength had not previously stood such a severe test, it was decided to strike while the iron was hot. So on April 1st the bulk of the farmers declined the $1.33 average for the summer and the "strike" began. They asked for $1.55 and the distributors who had made the prices for fifty years smiled. Throughout the district there were 150 locals which organized to cut off Chicago's supply and the distributors started to fight. Some farmers had signed up, but the members met these on their way to the loading platforms or the bottling plants and poured

MEMBERS OF ANTIOCH ASSOCIATION, WHERE ALL EXCEPT ONE FARMER REMAINED LOYAL.

their milk into the ditch. In most instances the locals paid for this milk, but the next day, if the men tried to ship again, it was confiscated without pay. The distributors then tried shipping in from the East; from outside the district in Wisconsin; from condensing plants. They tried every way to break the back of the organization whose strength was growing daily and which reached out and stopped these outside shipments. With two-thirds of Chicago's milk supply cut off completely the so-called "milk trust" had to yield and contracts were signed on the basis of the farmer's demands. Then the prices were increased from 8 to 9 cents on quarts to Chicago consumers. As Mr. Kittle explained, the farmers are getting their share now, but this increase to 9 cents places the association in a splendid position to demand better winter prices at contract making next fall.

The Milk Producers' Association is organized like our great labor unions. Shippers become members of local organizations which affiliate with the parent association and a part of the dues paid into the local stays with the local for its expenses and the other goes to the parent organization.

The association sprang into existence in 1909 as a protest against a Chicago ordinance requiring that all milk must come from tuberculin-tested herds or be pasteurized. This aroused the farmer to a sense of his importance and strength to accomplish great good to himself and his industry by co-operative organization and working and pulling together. The result was that in this matter of testing and pasteurizing the association won its first victory. Next came attention to prices, as the distributors had jockeyed them at will for many decades, endeavoring to keep the cost down and the selling price up. During the first year efforts of the association to force prices up failed and the infant organization had to submit to the trust prices. On November 1, 1909, the association asked $2 as a winter price, but could not enforce its demands and the distributors offered $1.66 which was accepted. This was a small advance used by the trust as a lever to force milk up 1 cent a quart in Chicago to the users, but the district attorney's investigation aided the association in checking this increase. However, the association during the next two contract periods secured slight increases which finally enabled the distributors to establish the 8 cents per quart price which prevailed in Chicago until this spring. Of this 1 cent increase to the consumer the farmer got only a very small fraction.

The history of the organization has been one of many ups and downs and it is not rosy by any means. Waning interest in 1911 after the retail price of 8 cents was established enabled the distributors to reduce the prices to the farmers 4 cents on the summer and 9 cents per hundred on the winter prices.

This aroused the farmers again to the power of organization and since 1912 the association has been growing rapidly until it reached the place where it is today—able to demand a fair price for the dairyman's product.

The officers of the association are: President, R. B. Swift, Libertyville, Ill.; first vice president, F. T. Holt, Pleasant Prairie, Wis.; second vice president, A. C. Gumm, Hobart, Ind.; third vice president, J. K. Rathburn, Lombard, Ill.; treasurer, F. H. Reese, Dundee, Ill.; secretary, W. J. Kittle, 29 S. La Salle St., Chicago.

BUILD OF HEMLOCK
The "Old Faithful" Lumber

This Is Building Time

Maybe the **BARN** has to have an addition—or are you going to build a new one? Certainly it's better to build the new **GRANARY** or **CORN CRIB** *now* than to wait till harvest time is upon you, and then have to postpone it until next year because you're too busy.

Wasn't it you who said last fall that you were not going to put off the **NEW HOUSE** another single year? Now is the best building time so let's consider what to build of.

A good many people, when it comes time to build, simply say: "Well, we'll need so-much lumber" and go ahead and buy it without much thought as to what is the best wood for their purpose. They don't always stop to think that for every kind of tree there is some particular best use to which lumber made from it can be put, or that wood usually lasts better and in general behaves better when used in the climate in which it is grown and not brought in from a great distance. Neither do they stop to think that home lumber helps pay home taxes.

The *special use* of "Old Faithful" HEMLOCK is for all rough lumber purposes—for framing, siding, rough boarding, under-floors, barn floors, platforms. It is strong, easy to work, and holds nails and paint remarkably well. It contains *no pitch* and does not take fire easily. Except in contact with the soil or in other "wet and dry" locations it will last a hundred years or so *at least*. It does not make good posts.

You see we don't advocate it for uses for which other wood is better, but *for its OWN USES* we just want to say to you that *there IS nothing better*. It grows mostly in Wisconsin and Northern Michigan and so it is right for this climate. Its price is right, too.

We want to make just one suggestion: Before you buy lumber go to your **LOCAL LUMBER DEALER** and talk to him about "Old Faithful" HEMLOCK. You'll get the right figures and the right advice. Also send to us for our

FREE PLAN BOOK—192 pages of plans and pictures of practical country buildings of "Old Faithful" HEMLOCK—the wood that has been doing the hard work on American farms for over 200 years. This is a valuable book and worth having.

The Farmers' Open Forum
WITH CONTRIBUTIONS FROM READERS OF THE WISCONSIN FARMER

Managing the Farm.

To the Editor:—I have spent considerable time in study as to what is the most important factor in making the farm a success from the managerial standpoint. It is rather a hard question to decide. To my mind, however, a most important factor is the care of the farm property. What property you have, much or little, attend to it from a business standpoint, as farming is a very particular business and one where you have to be careful if you are going to make the right amount of profit.

My farm is 120 acres, of which I cultivate about sixty acres. I used to raise quite a lot of oats and sell them, but I find that it pays better to raise more cattle and hogs and feed what I raise on the farm. I also raise more corn and I built a silo two years ago 14x38 feet. I have on hand now thirty-nine head of cattle, nineteen of which are full-blooded Short-horns of the milk strain. The balance of them are high quality grades. I have sixteen milk cows this year and keep a hired man during the summer months. I also raise a few steers and pure-bred Poland China hogs. I raise clover, timothy and alsike mixed. I feed cattle all they will eat and try to have them in as good condition in the spring as when I take them off the pasture in the fall. I did not really know that I was entered in the farm management contest of this county, but received the account book from our county agent, Mr. Klinka.

Polk Co., Wis. Henry Peterson.

More on Fencing Problems.

To the Editor:—In reading The Wisconsin Farmer of last week I noticed fencing problems by Louis Denis and I feel like making a few suggestions which may be of some help.

First, I would advise that he leave off the top barbed wire, because with posts sixteen feet apart that wire will always sag and look shabby. Rather raise the woven wire a few inches from the ground to make the legal height. I would not try to have the roadside fence of legal height only but use a forty-two inch and keep to six inches from the ground.

The height of farm gates should be the same as the rest of the fence, the width to suit the purpose for which the gate is to be used. I would not make them more than fourteen feet. I believe pipe frame for gates is best made from one-inch pipe and on rollers rather than hinges. For hogs and poultry put in an extra post and make a small door.

I think the best fence is the square mesh, welded, with the stays six inches apart.

Saw the posts two inches above the top wire, paint orchard fence tinted white or gray, or if the orchard is near the house paint posts same as the house; the posts in the barnyard the same as the barn.

Now I want to say something about what I consider the most important in fence building, namely, setting the posts. In the first place, I would pick out a good-sized post—about six inches in diameter—dig the hole, to the depth of twelve inches, about fourteen inches in diameter, dig the rest of the hole the same size as the post and then fill in around the post with concrete. I find that one sack of cement will set from twelve to fifteen posts and when they are thus set they are rigid and last ever so much longer. The concrete should extend a little above the ground, as the post always rots just at the surface of the ground.

I hope my suggestions may be of some benefit. Wm. Braid.

Racine Co., Wisconsin.

Sudan Grass.

To the Editor:—On the 4th of June last year I sowed half an acre to Sudan grass. Part of the seed I received from the United States Department of Agriculture. The rest was purchased from a seed company. On the 27th of July I cut part of it for hay and part for green feed for stock. Cows, calves and pigs all seemed to relish it. That which was cured made excellent hay. At the first cutting the grass was three and one-half feet high. On the 9th of September the second crop was cut. It was two and one-half feet high at that time and it made fine hay also. On the 6th of October, when we had our first heavy frost, the third crop was eighteen inches high. This, however, was not cut, but the cattle were turned in to eat it off and they seemed to like it.

The first crop yielded at the rate of three and one-fourth tons per acre, the second cutting one and three-fourths tons, and I judged the third would have yielded one and one-fourth tons if cut. I left a little on one side of the field and the seed matured before frost. I believe it should have been sown about May 10th or 15th for best results. While I do not think we have a great need for it in this state, where clover and alfalfa grow so well, in case of winterkilling of clover Sudan grass would make a good hay to take its place and if it could be sown early in the spring would yield two or three crops of hay in one season.

I trust this will be of interest to your readers. H. E. Krueger.

Dodge Co., Wisconsin.

Making Good in Dakota.

To the Editor:—I hope you can find room in your valuable columns for a few words from a North Dakota farmer. I was raised in Wisconsin on the farm near Argyle, Lafayette county. I am certainly an old friend of The Wisconsin Farmer. It is like getting a letter from home every time I get the paper. My parents settled near Argyle, Wisconsin, in 1866. I was born there in 1871 and grew up until 1897, when I came to North Dakota and worked out for the farmers around here until 1902. In that year I filed on a homestead, thirty miles north of Williston, Williams county, and I have lived here ever since. The climate here is fine and the crops average as good as in any part of the state. The soil is mostly clay. Our biggest drawback is that we are a long ways from a railroad. The nearest stations are Williston and Wild Rose, thirty miles away, but the Great Northern is going to build this summer on west through the mountains, so there will be a great change here in Williams county. We expect prosperity among the farmers in this vicinity, if wheat prices will stay around the dollar mark. There are a great many Wisconsin people here and they are all farmers, which is the right road to success. We have had a long winter and late spring and farmers are now busy seeding. This winter was the coldest since I came here. It was fifty below zero in January one time. It is lucky that we have a coal mine near by our place, and it sells coal at $1.60 a ton at the mine. Mormon, North Dakota.

LAW QUESTIONS.

Compensation of Supervisors.

A Subscriber, Suring, Wis.—(1) What compensation does the law of Wisconsin provide for supervisors of a township? (2) If supervisors hold a meeting for only one hour, can they rightfully call it a day?

Answer.—(1) The compensation of supervisors is to be fixed at the annual town meeting and when there is a failure to do this the law allows each supervisor $3 per day actually served and at the same rate for parts of days. (2) They cannot. It would be but part of a day.

Land Sale—Shortage.

Mr. Fred Luebeck, Suring, Wis.—I bought a lot in a town in Wisconsin, and the deed calls for eighty feet by ten rods, but the lot actually measures eighty feet by eight and a half rods. Am I entitled to what the deed calls for?

Answer.—If the person who sold the lot to you had good title to what your deed calls for you are entitled to the area of eighty feet by ten rods, but if he only had title to eighty feet by eight and one-half rods that is all you can claim of land, but you would have a good cause of action against him for damages on account of the shortage.

The United States produces 40 per cent of the world's iron output; 50 per cent of copper; 60 per cent petroleum; cotton, 50 per cent; silver, 25; corn, 60; oats, 30; and tobacco, 80.

Condition of Crops and Live Stock

WISCONSIN.

Bayfield County.—The cold, wet weather is unfavorable for seeding. Little seeding has been done. Plowing has commenced, but heavy soils are too wet to plow yet. Meadows came through the winter in fine shape, especially the new seeding. Winter grains have a fair stand. Fruit prospects are good, because snow and cold weather held buds back. Cherry buds are swelling. There will be more colts and pigs this year than usual. Live stock look fine; dairying is coming to the front. Sheep wintered well and the percentage of lambs is high.—E. C. Stevens.

Brown County.—Spring is very backward—cold and wet with little sunshine. Two inches of snow fell on April 30th. Seeding is not half done. No planting has been done. Old meadows are poor; clover and timothy that was cut last year winterkilled. Last year's seeding of clover is good. Live stock wintered well. Pig crop is about normal, but prices are high, from $8 to $10 a pair. There is a strong demand for pure-bred dairy stock at good prices.—J. D. McAllister.

Clark County.—Cold weather continues with heavy frosts at night and cutting winds. Some oats and barley have been sown. All meadows have winterkilled badly; so, also, have pastures and fall grains. Farmers are short on feed, and hay is scarce. Cherry and plum trees show an abundance of fruit buds; strawberries promise well. —Louis Buddenhagen.

Dunn County.—Frost occurred on May 1st, but no damage was done. Weather is cold and grain will not germinate. Grass has not grown much. —J. D. Miller.

Iron County.—Weather continues cold and rainy, and very little farm work has been accomplished. The percentage of young pigs is normal. Dairying is coming to the front in this region. Calves seem to be doing fine. There are many more good cows here than there were a year ago.—J. A. Becker.

Jackson County.—Weather conditions are improving slightly. More than half the oats and barley are in. Not much work has been done on corn ground, and planting will be late. If the supply of seed proves adequate, there will be an increased acreage of corn this spring on account of loss of the clover seeding. Pastures are very backward, and many cattle will not be turned out before May 10th or 15th. A good many silos may be put up this year to help out the hay shortage. Some farmers have already sold cattle they had intended to keep another winter, and many more will sell before fall. An increased acreage of barley has been sown for feeding.—P. W. Jones.

Langlade County.—Farmers are beginning seeding. Ground is wet and cold. Clover is looking good, but is not growing much on account of cold weather. Pastures are beginning to look green. Farmers have had poor luck in raising young pigs, many pigs dying within twenty-four hours after birth. Calves are in normal condition. A few cases of contagious abortion are reported this spring.—Chas. Lade.

Oneida County.—About two-thirds of the oats are planted. Clover seeding is looking fine. Because of cold weather, pasture is not coming on very fast, which is a hardship to those who are short of hay. Very little hay and no silage are left. Farmers are showing an interest in pure-bred poultry; more eggs and day-old chicks have been purchased in the county than ever before.—Clyde Burkhart.

Outagamie County.—The season is later than it has been for many years. Spring seeding has scarcely commenced. Much spring plowing is yet to be done. Very little hay is being shipped out. Winter grain and meadows came through the winter in fair condition. Corn is very poor and high priced. Because of last year's corn failure, hogs and pigs have been marketed and now pigs are very scarce and sell for $3 or $4 each. Cases of abortion have been reported among stock this spring.—Peter Tubbs.

Pierce County.—Weather is wet and cold. A soaking rain fell April 29th and a hard frost came May 2d. Spring seeding will be finished this week. Early sown grain is up and is looking good in spite of cold. Feed in the pastures is still very short.—G. K. Moore.

Price County.—Season is late. Seeding has begun. Ground is in good condition but somewhat wet. Grass is coming slowly. General crop prospects are good. Fruit trees have not been damaged. Stock are in fair condition. —C. F. Glissendorf.

Richland County.—Weather is cold with lots of rain. Early sown oats are up and doing nicely. Some are plowing for corn. Good seed corn is scarce. There is no pasture yet. Some early potatoes and gardens have been planted. Stock is in good condition. Roads are bad in places.—E. C. Stewart.

Rusk County.—Weather is backward and cold. Fall seeding appears to be in fine shape. Pastures are backward. Some seeding has been done. Live stock look good, but feed is scarce. Some farmers are buying hay for $17 a ton.—V. V. Miller.

Sawyer County.—Field work is very much delayed. On light soils plowing and seeding is being pushed, and about 75 per cent of it is finished. On heavy soils little work has been done. In some fields the water is still standing. Clover and grass are coming up slowly. Pastures are not sufficient to allow barn feeding to be discontinued.—Jens Uhrenholdt.

St. Croix County.—Weather continues cold and wet and farm work is behind. Considerable seeding has been done on light sandy soils in the western part of the county, but very little on the heavy clay of the eastern half. Winter rye looks fine, also the grass which was seeded last year. Old meadows are not doing as well as last year's seeding. More early potatoes have been planted than usual. Pig crop is short and many farmers are complaining of poor luck. Wet, cold weather and lack of nourishing feed are partly responsible for the loss of pigs. There is no disease among live stock at present.—Stephen Everson.

Taylor County.—Spring is late, but grass has a fine start. Seeding has begun and more oats will be sown than last year. Hay meadows look good, but are late because of cool, rainy weather. Old hay is scarce and sells for $15 a ton. Lots of calves are being shipped out every week. Spring pigs are scarce. Seed oats and seed potatoes are scarce.—E. H. Dehne.

Washburn County.—Oats seeding will be finished next week. There has been too much wet, cold weather and cloudy days. Pastures and meadows are very short. Rye is looking good. The pig crop is poor. There is a good demand for young cattle and fresh cows.—John W. McCulloch.

Winnebago County.—Spring is cold and backward—later than it has been for several years. Land is very wet and plowing has not commenced. A little grain has been sown on knolls and highland. Pastures and meadows are starting. Clover and alfalfa winterkilled badly. About 50 per cent of the little pigs have died. Most calves are sold for veal.—Seymour L. Smith.

Lake Mills Holstein Breeders' Sale.

The thirteenth annual sale of the Lake Mills Holstein Breeders, Lake Mills, Wis., though establishing no high record average for this sale, was very satisfactory to the most of the consignors. There was probably the largest attendance from the southwestern states that has ever been seen at a Wisconsin sale of dairy cattle. There were a great many buyers present from Iowa, Missouri, Kansas, Texas, Tennessee, Colorado, and they were heavy buyers. The southwestern part of the United States is just awakening to the possibilities of dairying and to the fact that Wisconsin can supply them with a larger quantity and a healthier, better type of cattle than any other section of the United States. One of the heaviest buyers of the best animals was Ex-Governor Stubbs, of Kansas. He is a careful, discriminating judge and was willing to recognize their value. Other liberal buyers were D. H. Brinkman, Sheldon, Iowa; Ed Solomon, El Paso, Texas; G. H. Burrill, Le Mars, Iowa; Ernst Nass, Jefferson, Wis.; F. M. Sharp, Madison, Wis.; Geo. Williams & Son, Orfordville, Wis. A two-day-old heifer calf sired by Colantha De Kol Pietertje sold for $175, and a three-weeks-old bull calf consigned by Ben Berg, Lake Mills, Wis., sold for $650. There were a fine lot of cows that sold for from $400 to $525, one selling for $1,000, consigned by C. C. Fries & Son, Richland Center, Wis. A detailed list of the sale is given below:

BULLS.

Emblagaard Tritomia Joseph, March, 1912; Fred Wittwer, Mt. Horeb, Wis.	$ 125

POSITIONS wanted. Do you need farm help? We have many able-bodied young men, experienced and inexperienced, who want farm work. Ours is a philanthropic organization; no charges to employer or employe. If you need good, steady, sober man, write to Jewish Agricultural Society, 707 Twelfth St., Chicago, Illinois.

MEN wanted for detective work. Also instructed by former U. S. Govt. detective. Write J. Ganor, 2309 Calumet, Chicago, Illinois.

The Raising of Spring Lambs.

A Good Spring Lamb Market Should Encourage Extraordinary Care of the Flock---By Howard Hackedorn.

A PART of a load of spring lambs from Iowa sold for 17 cents per pound at Chicago recently. This foreshadowing of a good spring lamb market means that every care possible must be given these new lambs. Lambs lost means dollars lost.

In the first place, the ewes must receive feed enough to produce an abundance of milk for the lambs. It is just as important, or more so, to the sheep men to have a high production of milk in his ewes as it is to a dairyman to have high producing cows.

If the grass or rye pasture is not quite ready to turn on, a ewe suckling a lamb will need milk producing feeds such as bran, oil cake, clover or alfalfa hay and silage, if good, clean, sweet silage is available. Corn and timothy hay are poor feeds for ewes suckling lambs. A ration of six parts corn, three parts bran, one part linseed oil meal with clover or alfalfa is a good one. An average ewe should receive a pound to a pound and a half of the grain mixture and all the hay she will clean up.

DOCKED LAMBS PRESENT AN ATTRACTIVE APPEARANCE TO THE BUYER.

Rye sown in the cornfield in the fall after the corn is taken off makes an excellent early pasture for ewe and lamb. It usually will be ready to pasture two to three weeks before blue grass. Thus considerable feed is saved and the ewes relish the green fed. As soon as the grass grows enough to furnish an abundance of feed additional feeding will not be necessary.

Feeding lambs grain in "creeps" is a good practice. A "creep" can be fixed up in any sheltered, sunny spot, preferably in a shed open to the south. A pen is fenced off with several openings large enough to admit the lambs but too small to allow the ewes to get through. A trough should be put in the creep to feed grain in. This trough should have a board fixed over it to keep the lambs from getting into it with their feet but high enough so as not to interfere with the lambs' eating. A ration of six parts cracked corn, two parts bran, and one part oil meal is a good one to start the lambs on, gradually eliminating the bran and cake. The lambs will not eat much, and unless the grain is clean and sweet they will eat very little. Fresh grain should be given daily. Any left-over grain can be fed the ewes.

The docking and castrating of the lambs should not be neglected. Docking is a very simple operation and can be accomplished with practically no danger. Market men state that docked lambs are worth from 25 to 50 cents more per 100 pounds, primarily because they present a more attractive, uniform appearance, which is of much value. Lambs usually scour a little when first turned on grass, and the dung collects on the tail, making a very bad appearance and an excellent place for maggots to grow and cause trouble.

If the lambs are young the tails can be taken off with a knife about one inch from the body. Lambs up to two weeks of age can be successfully docked with a knife. This method has the advantage of requiring less labor and the wound heals more quickly than when the docking is done with hot pincers. The hot pincers are used more successfully on older lambs because by this method there is practically no danger from bleeding. The pincers are nothing more than large iron shears which are heated to a good red heat in a portable forge or more conveniently in the flame from a tinsmith's gasoline blow torch. These shears can be purchased from sheep supply houses for $1.25 to $1.50 per pair.

When docking lambs with hot pincers care should be taken not to be too quick or to have the irons too hot. The end of the blood vessels must be thoroughly seared to prevent bleeding.

Castrating is not so important as docking if the lambs are to be sold in June or early July. However, if they are to be kept over the summer, castration of the ram lambs becomes very necessary. It should be done at the same time as the docking is done.

One should select a warm, bright day for docking and castration to prevent colds and other attendant difficulties, in case the lambs should bleed badly and become weak in condition. It is also preferable to dock and castrate the lambs as soon as they become good and strong, at from two to three weeks of age, depending upon the condition of the lambs. However, if the farm work does not permit of docking and castrating at this time it can be successfully done at an older age.

New castrated lambs should not be disturbed for twelve to fourteen hours. That is, they should not be driven any distance. If one is careful and clean there is practically no danger from docking and castrating lambs.

Cold, damp storms of early Spring never bother the cozy household warmed by AMERICAN Radiators and IDEAL Boilers, which furnish heat to suit the weather.

Defeat chill days of early Spring

Farm life in the early Spring, when weather is changeable and dangerous, can be made most pleasant and healthful by flooding the entire house with the health and comfort-giving warmth of an IDEAL heating outfit.

AMERICAN RADIATORS & IDEAL BOILERS

If you have managed to get through the entire winter with stoves or other old-fashioned methods of heating, you have suffered more of discomforts and inconveniences during one winter than you will ever again experience if you adopt the IDEAL heating way.

So decide now to find out all about AMERICAN Radiators and IDEAL Boilers. They give you and the family the warm, healthful home to which you are entitled.

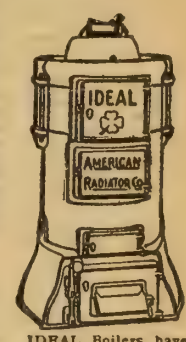
IDEAL heating—best for farm house

During chilly days and blizzard days the IDEAL Boiler furnishes just the heat required to keep the house comfortable all over without waste of fuel. Gives any farm house all comforts of a city home. Water mains not necessary. Saves labor and burns smallest amount of fuel. Thousands in use in every State in the Union. Farm houses have use for IDEAL heating at least eight months in the year, and on sudden cool Summer days a little kindling-fire instantly puts genial warmth all through the house.

A No. 020 IDEAL Boiler and 262 ft. of 38-in. AMERICAN Radiators, costing the owner $185, were used to heat this farm house, at which price the goods can be bought of any reputable, competent Fitter. This did not include cost of labor, pipe, valves, freight, etc., which vary according to climatic and other conditions.

Write today for "Ideal Heating"

You will get this valuable book free, by return mail. Get started on your outfit right away. Prices are attractive, so act at once!



IDEAL Boilers have large fuel pots in which air and coal gases thoroughly mix as in a modern gas or oil mantle or burner, and extract every bit of the heat from the fuel. Easier to run than a stove.

A CATCH CROP OF RYE AFTER CORN MAKES EARLY SPRING FEED FOR EWES AND SUCKLING LAMBS.

YIELD PER ACRE GROWS.

Statistics Show Gradual Increase in Last Twenty-five Years.

Crops in America are by slow degrees increasing in yield per acre. The department of agriculture has ascertained that during the past twenty-five years the production per acre in this country has shown an increase at the rate of nearly 1 per cent per annum.

This upward trend is not readily observed in yields from one year to another, owing to the wide yearly variations caused by the vicissitudes of the seasons. But when averages are obtained of a series of years the effect of the seasonal variations is neutralized and the general trend is readily observed.

During the decade of the 70's and 80's when there was a vast expansion in farm areas in the West and crops were grown on a more extensive scale, the tendency of yield per acre was downward. Since the early 90's, however, the trend has been decidedly upward.

In France 100 years ago the yield per acre of wheat was less than the average now in the United States, but the yield increased in each decade, the average now being about twenty bushels; the increase during the 100 years has averaged about ¾ of 1 per cent a year. Similar increases have been made in other countries.

A striking reversal of the general trend, due to a specified cause, is the reduced yield per acre of cotton in those sections affected by the ravages of the boll weevil. Before the presence of boll weevil the yield per acre in both states tended upward. But since 1906 the boll weevil has caused the average yield in Louisiana to fall rapidly, while the yield in North Carolina and other non-affected states, has continued to increase.

The total value of crop production in the United States in 1915 is estimated as about $6,471,000, as compared with $5,929,000 in 1914, an increase of 9 per cent.

Cannon loaded with sand have been found effective in breaking up swarms of locusts that frequently appear in Costa Rica.

LANDS AND HOMES

PROSPERITY IN CANADA—$900,000,000 in new wealth added in 1915. Enormous crops and low taxation make farmers rich. Wheat average, 36.16 bushels per acre in Alberta, 28.75 bushels per acre in Saskatchewan, 28.50 bushels per acre in Manitoba. Taxes average $24 and will not exceed $35 per quarter section, includes all taxes; no taxes on improvements. Free schools and full religious liberty, good climate. Get your farm home from the Canadian Pacific Railway. 20 years to pay. Good land from $11 to $30 per acre; irrigated lands from $35, and the government guarantees your land and water titles. Balance, after first payment, extended over nineteen years, with interest at 6%; privileges of paying in full any time. Before final payment becomes due your farm should have paid for itself. We will lend you up to $2,000 in improvements in certain districts, with no security other than the land itself. Particulars on request. Ready-made farms for sale. Special easy terms. Loans for livestock. In defined districts, after one year's occupation, under certain conditions, we advance cattle, sheep and hogs to farmers up to a value of $1,000. We want you; we can afford to help you. We own the land; we want the land cultivated. Our interests are mutual. Buy direct and get your farm home from the CANADIAN PACIFIC RAILWAY. Send for free book. J. S. Dennis, Assistant to the President, Canadian Pacific Railway, 82 Ninth Ave., Calgary, Alberta, Canada.

Wisconsin Farms

In the Clover Dairyland of the famous Chippewa Valley in **Southern Sawyer County, Wisconsin.**

Prices $15.00 to $28.00 per acre.

Liberal terms if desired.

FOR Minnesota improved farms and land bargains, write or call on H. A. Hanson, 242 Temple Court, Minneapolis, Minnesota.

FOR SALE High-grade Guernsey heifer calves at $15 each. Address Fern A. Findlay, Whitewater, Wisconsin.

Revive State Holstein Association

Called Meeting Held in Watertown Takes up the Matter of Issuing Annually an Official State Holstein Directory.

THE Holstein-Friesian Breeders' Association of Wisconsin at a called meeting held in Watertown May 4th adopted plans for enlarging the scope of its activities. It was decided to issue in the near future a directory of Wisconsin Holstein breeders. The plan approved provides that the cost of the book shall be met by a charge for individual advertisements and also a charge for insertion of the name of each breeder and the number of cattle he has to sell. The purpose of the whole plan is to revive the state association. While there are about 1,200 so-called members of the association in Wisconsin, it was reported that only about fifty had paid their dues and less than 300 were sufficiently interested in the work of the association to forward their proxies as members of the Holstein-Friesian Association of America, which meets in Detroit, Michigan, June 7th.

Any Holstein-Friesian breeder in Wisconsin may have his name and the number of cattle he owns inserted in the Wisconsin directory under either of the following plans:

First—By taking an advertisement of a quarter page or more in the directory. The minimum cost of $9 for quarter page, and the cost for half page is $15 and for full page $25. This cost also includes a year's membership in the state association.

Second—By taking a smaller advertisement and paying a fee of $1. This includes a year's membership in the association.

Third—By taking a year's membership in the association and paying $2.50 for the same. This last proposition is open to all breeders whether they advertise in the book or not.

Each breeder who becomes a member under any of the plans suggested will receive a copy of the book. Advertisements in weekly and monthly papers which reach farmers and dairymen are expected to bring inquiries for the book. Copies will also be sent to any prospective purchasers of stock, names of same to be handed to the secretary of the association. It is proposed to issue 5,000 of these books at a cost of approximately $500. Breeders who have half tones in the book will pay for the cuts at cost price.

An important feature of the new plan is a pledge to be given to the association by such member as is willing, to the effect that he will annually execute a proxy for his vote in the Holstein-Friesian Association of America. Said proxy is to be made in favor of the Wisconsin association proxy committee and is for the purpose of insuring united representation in the national association on any problems which may come up. Of course, any member may retain his vote for his own use, but under the new plan he pledges his proxy on the theory that he will not be present to vote it in person. In the past a large portion of the Wisconsin proxies have been voted by easterners. An effort made to gather Wisconsin proxies this year has resulted in less than 300 being placed in the hands of the committee. Eastern interests have been able to get double that number of proxies to vote at national association meetings. Expressions of opinion regarding the new plan were given by J. P. Riordan, C. F. Comings, Pres. R. J. Schaefer, A. W. Hopkins, Sidney Jones, George C. Humphrey, Mr. Bristol, Fred Pabst and others. There was an apparent unanimity of sentiment that the publication of the book will help unite the Holstein-Friesian interests of the state and also furnish needed funds. A large number of breeders who were in Watertown attending the sale last week subscribed to the advertising columns of the book. Having the official sanction of the association, Sec. C. J. Schroeder is now confident the plan will work out fine.

BOOK ON SMALL GRAIN.

M. A. Carleton Produces Best Volume Ever Published.

Unquestionably the highest authority in the United States on problems relating to grain crops is Mark Alfred Carleton, in charge of the work of cereal investigation in the United States Department of Agriculture. From time to time this expert has prepared bulletins for general distribution and these have proven to be most valuable, indeed. At this time we are able to announce the publication of a most excellent volume by this author under the title, "The Small Grains." While this book is intended primarily for instruction in colleges, it is nevertheless well adapted to the specific needs of grain growers. A considerable part of the volume is devoted to the problem of grain improvement. Under this heading the cleaning and grading of grain is taken up in detail and also the question of selection in its relation to grain improvement.

The author of this volume devotes considerable attention to soil problems and he takes up and discusses with a very marked degree of thoroughness weed pests. An interesting phase of this volume is that devoted to the study of the characteristics of the various crops. It is a well-known fact that crop rotation is altogether based on the difference in feeding habits and root characteristics, so that knowledge of these matters is of the utmost importance to the grain grower. Even those whose practices are sound will find pleasure and profit in adding to their knowledge as to why and wherefor of these practices. In the volume referred to these matters are elucidated most clearly and interestingly. This is a book that should be in the library of every farm home and arrangements have been made by The Wisconsin Farmer whereby it will be furnished readers at the regular publisher's price, $1.75.

West Salem Guernsey Sale.

The sale of Guernsey cattle made by Rundell Bros. and A. I. Stubbs at West Salem, May 3d was a success in many ways. There was one feature, however, that was somewhat detrimental to the sale, that being the fact that the farmers are so very busy at this time and consequently the attendance was not as large as at some of the previous sales, however, there was a good crowd of breeders who bid well on the better stuff throughout the sale. The get of the great bull, imported Holden 4th, was in demand and the nice lot of young stuff in the sale demonstrated his ability as a sire above the ordinary. The top of the sale was two yearling heifers sired by Holden 4th. These sold for $725 each and went to Glen Ayre Farm, Glenview, Ill. This was an excellent buy at that figure. This farm also purchased No. 29 of the catalog, also by the above bull, paying $500 for same. They bought several of the best things in the sale. Females sired by Imp. Gov. of St. Croix, the excellent bull heading the Rundell Bros. herd were also in demand. This was the first time that the Rundell Bros. consigned to the West Salem sale and they offered animals that were pleasing and that will be advertisements for them in the respective territories to which they go. Col. N. G. Kraschel, the noted Iowa auctioneer cried the sale and, although this was one of the few Guernsey sales he has made in Wisconsin, the results were very satisfactory and he made many friends by the manner in which he conducted the sale. We follow with a list of prices and buyers of all cattle.

In and Around Wisconsin

Plan on Foot to Enact Law For Selling Eggs by Weight Instead of by Count---Other Items of Interest to Our Readers

County Field Representative H. H. Humphrey is arranging to organize a cow-testing association in the neighborhood of Mosinee, Marathon county.

A new method to avoid the expense of steaming tobacco beds has been tried out by a few growers with some degree of success. It is to saturate the beds with gasoline or kerosene and apply the torch. It is claimed that the weed seeds are killed as effectually as by steam, but the plants do not make quite as rapid growth. If the price of gasoline gets higher it is not recommended as an economical plan.

The state department of weights and measures now contemplates a Wisconsin law which will require that eggs be sold by weight instead of by the dozen. An effort is being made to get the sentiment of dealers along this line. In some cities eggs are divided into the larger and smaller grades and sold at a difference of a penny or 2 cents a dozen. If there is to be a distinction made, however, it would seem that the weight system would be the more equitable. Eggs are about the last farm product which it is proposed to put into the weight class.

A Wisconsin tobacco dealer who keeps close tab on all matters relating to his business, figures that the 1915 crop of Wisconsin yielded close to 38,000,000 pounds. This is at least 2,000,000 pounds in excess of the government estimate. It is generally believed that the agricultural department's figures of our crop statistics have been below the actual production in this state for some years past. The revenue department's statistics of tobacco on hand, issued twice a year, bear out this contention, for it is a check on the crop estimates issued by the agricultural department.

E. L. Luther, superintendent of the Wisconsin county agents, recently toured Sawyer county in company with C. P. West, the Sawyer county representative. Meetings were held at Weigor, Exeland, Winter, Radisson, Stone Lake and Seeley. The discussions revolved mainly around the subject of potato raising. Mr. Luther made several talks on dairying. He said a man might start a dairy herd with $400 or $500 invested in fairly good cows and a registered sire for breeding purposes. He ridiculed the idea that it was necessary to have $5,000 capital to get started in the dairy business in Upper Wisconsin.

Grocers in Taylor county are cooperating with their patrons in a movement which is expected to increase the poultry and egg production. The grocers are furnishing in many instances a setting of Rhode Island Red eggs. No charge is made, but the boy or girl who gets the setting must agree to handle the hatching properly, take good care of the stock produced and give the grocer a setting next spring. In this manner the plan can be put on a revolving basis and the grocers will have a cash outlay only for the settings furnished the first year. This is a splendid effort to aid the young people of Taylor county to get a start in the poultry business.

Prof. A. G. Burg, superintendent of the Marathon County Agricultural School, is assisting the school and city officials of Wausau in a novel plan to help the poor. Land will be furnished free, to be used by poor people, who will be expected to seed it and cultivate it and care for the crop. Professor Berg will help to select the seed, to advise the gardeners on any subject which may come up and to see to it generally that the agricultural part of the plan is a success. The city and school board have a number of vacant lots which can be used and which at present are lying idle. This is rather an intensive system, but there is no reason why the poor who are unable to lease land may not raise a considerable amount of stuff to aid in their support through the winter. At least the plan seems to be better than for the county simply to dole out money and provisions. There may be a few of the county poor who will not care to work on this basis, but a majority of them will probably be glad of a chance.

Waushara county will have a boys' corn-growing contest this year and a number of young fellows are entering. Pure-bred seed is furnished through the courtesy of one of the bankers of the county. There is seed for about twenty acres and liberal premiums are offered the bankers of the county for the boys who win places in the contest.

Walworth county has planned many contests for this summer to interest the boys and girls of that county in better farming. There will be a corn contest for country boys between twelve and eighteen years old; a potato contest for city boys of the same age who are not situated so they can raise corn, and a tomato contest for girls, open to all. About $300 in prizes is announced. The judging will all be done at the county fair. In addition there is the "baby beef" contest which will be decided at the fair.

Co-operating with the department of farmers' institutes the Wisconsin Live Stock Breeders' Association and the Wisconsin Sheep Breeders' Association will hold a series of special sheep institutes this summer in some of the northern and western counties of the state. Frank Kleinheinz, shepherd of the agricultural experiment station flocks, will assist at several of these meetings.

Floods have done a great deal of damage the past few weeks in the western, southwestern and northeastern portions of the state. The Wisconsin river has been on a rampage and the Mississippi has been high all along the western border. Seeding has been delayed by the floods and cold and in some instances considerable damage has been done to property by the high water.

Arthur Broughton, president of the Wisconsin Live Stock Breeders' Association, has appointed C. W. Thompson, of Lake Geneva; J. P. Riordan, of Mayville; H. C. Taylor, of Orfordville; C. L. Hill, of Rosendale; Eben E. Jones, of Rockland; John Erickson, of Waupaca; Frank Swoboda, of Antigo; James Dillon, of Mondovi; Frank T. Stare, of Ladysmith and Frank Swan, of Wauwatosa, as district representatives of the organization

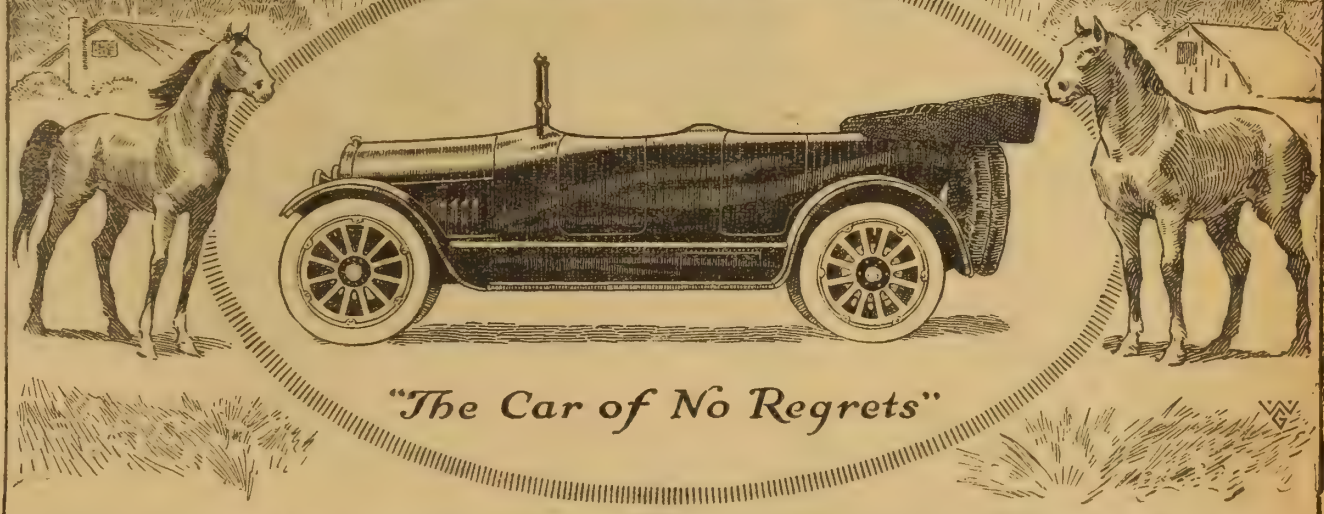
J. G. Milward, secretary of the Wisconsin Potato Growers' Association, will hold, during the next few weeks, a series of conferences with farmers and business men at a number of points in the "potato belt." The first of these sessions will be held at Waupaca, Chippewa Falls, Tomahawk, Seeley, Spooner, Barron, Marinette and Crivitz.

Brick cheesemakers of Dodge, Washington, Jefferson and adjoining counties have been discussing the advisability of changing their basis of buying milk from the present weight system to the fat system. Under the new plan milk would be sold according to its value in fat. The Babcock test has been used for twenty years as a basis of payment for milk for the cheddar cheese factories.

Seven hundred and fifty thousand acres of land have been opened for homestead purposes in southern California. The government has also opened 1,500,000 acres in South Dakota.

KING

EIGHT CYLINDER



"The Car of No Regrets"

The admired characteristics of Thoroughbred and Percheron are combined in this *pioneer* Eight. The Speed, Grace and Stamina of one are merged with the Power, Sturdiness and Reliability of the other

The Farmer is quick to recognize *quality* in stock and no less appreciative when he finds it in machinery. His motor car is as personal to him as his fine horses and is generally purchased with the same care.

We are confident that the King is so very much the car he has long desired, that we urge his investigation of this successful Eight before deciding on *any* other make.

The Eight-Cylinder King has been in operation for over a year throughout America and in more than thirty foreign lands. Prior to this, the King Four made a most enviable reputation the world over for efficiency and reliability.

The new Model E is larger and more powerful than our *pioneer* Eight, and contains many thoroughly tried advances in automobile engineering.

Aluminum pistons are a feature of this model; one-third the weight of iron pistons, they greatly increase engine power and reduce the strain on crank-shaft, bearings and all reciprocating parts. They also resist carbon and economize fuel.

Cantilever Springs—which the King introduced to America—reach their highest efficiency as designed for this car. These springs give a restful, lazy motion over the roughest roads and keep the tires gripped to the road.

From a stand-still this car will accelerate to 25 miles per hour *in eleven seconds*, without gear-changing, and lightning "get-a-way" from a start "in high" is only a small part in the amazing performance of the King's super-motor. Hills melt before this powerful car, and they're mostly taken in high gear. "Locomotive" speed is always ready—for the need that comes once in a lifetime. Silence, economy, and ease of operation are naturally features of this perfect mechanism.

Model E, 7-Passenger, 60-Horse-power Touring Car, $1350

VIEWS ON USE OF TRACTOR.

Letters From Farmers Who Have Either Had First-Hand Experience or Have Some Views as to What They Expect a Good Tractor Should Do.

Fourteen-Year-Old Boy Handles Tractor.

To the Editor.—I am going to relate some of my experiences with a light tractor. I purchased this tractor November 4th last year. I have had enough trial now to know that I like

DOING IT ALL IN ONE OPERATION WITH A TRACTOR.

it very much. It is twenty horse power on the belt and seven horse power on the drawbar. It is a three-wheel tractor. The drive wheel runs in the furrow and has lugs three or four inches long and two and one-half inches wide and never packs the ground. It subsoils in place of packing it. I plowed thirty acres with it and I used two fourteen-inch bottom gang plows. It all depends on the land you plow. If the land is level or rolling and not too hilly you can plow six to seven acres per ten hours' work. It will take fourteen gallons of gasoline, one gallon lubricating oil and one-half pound of cup grease. I am using the tractor this spring. We use a gang disk and drag in the rear and it does very fine work. I can disk and drag eighteen to twenty acres a day, putting it in fine shape to sow. A man plows it with the team and uses the gang. In that way we get over a good field in a day. I find it takes a mighty good walking team to follow this light tractor.

Another thing, this tractor does not pack the soil while disking, for the most weight is on the driver and that subsoils more than packs. My farm contains 145 acres. I do not regard it as a real tractor farm because we have some ground which we are unable to plow with the tractor. I have three work horses, all good size. We finish up the bad land with the team. I have a boy fourteen years old. He can run this tractor on the gang plow or on the disk. However, I believe in running your tractor yourself in order to keep it well oiled, because oil is the life of the machine. If you take good care of a tractor it is about the same amount of work as it takes to care for a team of horses. Give the tractor good care and it will last a long time.

We have done some belt work on a big feed cutter with a blower. The tractor has plenty of power to spare. It runs ten hours on heavy belt work on ten gallons of gasoline, one gallon of oil and one-half the grease it would take on ten hours' plowing. I certainly believe the tractor is well worth what it costs. It takes the heavy work off the horses and lets you keep less horses to do the work. It also does the work quicker and better. Furthermore, you are able to work your land any depth you want it and it doesn't hurt the tractor like it would the horses. I believe any man who has a nice, level farm should have a tractor, but be sure to get one that doesn't pack the ground. I believe there are some tractors which do pack the ground. Furthermore, we have a combination gang plow for sod or stubble. It turns both over very nicely and we intend to plow our sod for corn with the tractor and run the disk behind the gang plow and do both at the same time and with this arrangement, I feel sure, we will have power to spare. We tried the experiment last fall and it worked fine. There is a great deal of other work which you can do with a tractor, but this letter will be of interest to some of your readers.

Mr. Fred Weippenbach.
Waukesha Co., Wisconsin.

Believes Tractor Has Come to Stay.

To the Editor:—Last fall we bought a 7-20 and find that we picked the right type. The main thing to consider is the type. In so doing one must consider the lay of his ground, climatic conditions, size of farm, and the amount of work to perform. There are many different kinds of tractors on the market, but some have advantages over the others. Especially is this type in regard to traction. Without the proper traction one has no use for his machine.

TRACTOR IS USEFUL IN GARDEN AND ORCHARD TOO.

The prospective purchaser must consider the horse power necessary to fit the above conditions. I do not believe in the heavy, cumbersome machine which is hard to handle. The light-weight tractor, in my opinion, will not pack or injure the soil any more than horses. I would suggest that it should not weigh over 6,000 pounds, so if this weight is properly distributed and on the right kind of a base, no injury will be done the soil unless it is exceedingly wet.

After the purchaser finds the horse power necessary and the proper traction qualities, then he should examine carefully and observantly every detail of his power plant. I wouldn't give 2 cents for a fine-looking tractor with the above attributes if it has a bum power plant. About the only way a novice can find this out for himself is to examine some dozen or so of the standard makes, and that one which seems the simplest to him is usually the one which he will understand the best. At its best a tractor is a complicated piece of machinery, and like all gas engines, it has its whims. It is as unlike other farm machinery as can be, and needs strict attention. Its work is hard and it is subject to all kinds of strains, and so it must have endurance. Therein lies the one great economy of the tractor. Here again is where the problem of the power plant confronts the purchaser. As the insides of a horse must be in prime condition, so must the insides of a tractor be also. Examine closely the cylinders, pistons, connecting rods, crankshaft, bearings, electrical parts, and above all the lubricating system. As the life of a tractor depends upon its power plant so does the power plant upon its lubrication. Your repair bill must be reduced to the minimum, and unless lubrication is properly introduced to the vital bearings you may as well keep your horses and pay a veterinarian.

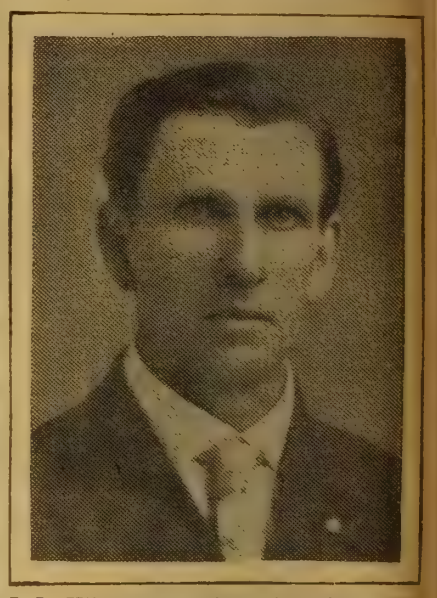
One must choose the type of tractor best suited to his needs. He must look over the various machines and figure for himself which one he wants. Don't let some salesman sell you something you don't want; don't be afraid of making two or three or half a dozen of them sore, but get what you want to spend your money for.

I shall now give a brief account of my personal experience, which goes to show that it depends a good deal upon the operator as to whether he likes a tractor or not. If he can learn to handle it and get the idea out of his head that he isn't driving a horse or mules, then he will have better luck.

We have a 240-acre farm, some of it lying pretty rough. Being shy on horses, we considered whether to buy four more or their equivalent. We needed also a power plant for belt work and figured that a twelve-horse engine was needed. Now, after due deliberation, we decided that the horses and engine were too much money invested and decided that a tractor would pay us. It cost less, would do more work, and if properly taken care of would last a long while.

THIS TRACTOR HAS TAKEN THE PLACE OF SIX HORSES.

Well, we ordered our machine. It did not take me very long to find out that I had a different kind of animal to handle than any I had had any experience with before. The first thing I did was to run her off a fill across a ditch and run her nose into a bank. I was lucky that I didn't injure something, but it took us three hours to



J. L. KRAUSE, DODGE COUNTY, WIS.

get her out of the ditch. Then I started to plow with her. After the first day I was not so enthusiastic as I had been. It was the hardest work I ever did, and I made some sorry looking furrows, believe me. But after experimenting with it awhile I found that it wasn't the machine, but the driver. I found that even a tractor has its limitations. Some places you think they will go and they won't, and some places you think they won't go and they will. One must not drive into doubtful mudholes. I've stuck several times, and it's seldom ever easy to get out.

So I began to put it to the test. I wanted to see what she would do. Up to this time I have had that tractor in all kinds of places; I have plowed up over hills, around hills, through clay and gumbo, and I have plowed deeper than any four horses could ever be expected to pull a plow. I've ground feed on a ten-inch burr mill, sawed wood, hauled water, disked, harrowed, and everything which I have done with it has been under the most adverse conditions. I have worked with it until I know about what it will do and what it won't do, and that at a minimum expense.

Now here's another important item, and that is the consumption of fuel. I've just finished plowing forty acres and I used 110 gallons of gasoline, an average of two and three-fourths gallons per acre. It uses a gallon of lubricating oil per day.

As an illustration, we will figure three gallons per acre. Including the

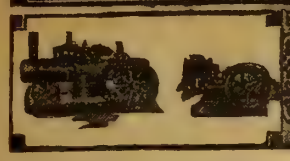
FARM MECHANICS



Auto, Farm Engine and Farm Machinery Ailments diagnosed and remedies suggested in this department

QUESTIONS AND ANSWERS.

Belt Power of Motor.

What horse power would a two-cylinder Buick engine develop on the belt? What would be its power in common gas engine rating? Would it pull as much as a single cylinder, ten-horse-power stationary gas engine?

Answer.—It should develop ten H. P. to fifteen H. P. and should pull as much as a single cylinder stationary engine of that rating.

Noisy Gears.

Please tell me why the gears on my car grind when shifting gears. Are the gears worn, or is there something wrong with the clutch?

Answer.—If your gears run quietly except when being shifted the trouble is probably caused by the clutch "spinning," that is, the clutch keeps on revolving at near engine speed after the clutch is released. Before the gears are shifted the clutch should come almost to a standstill. Clutch "spinning" may be caused by too tight adjustment or poor lubrication. It may also be due to faulty mechanical construction. A leather-faced disk is often placed about half an inch back from the rim of a cone clutch to act as a brake when the cone is out.

It may be that some of the gear teeth are battered on the end. It would be well to remove the transmission case cover and examine the gears. If there are any burrs on the teeth the gears should be removed so that the burrs may be ground off.

Motor Power.

Which is the more economical, a high speed or a low speed gas engine? What would be the highest speed that an automobile motor could be safely run all day? Will an auto engine running at 1,500 R. P. M. develop twice as much power as the same engine running at 750 R. P. M.? Would a 4⅛x4¾ four-cylinder auto motor develop enough power to run a thirty-two-inch cylinder separator with all the attachments?

Answer.—The high-speed engine is considered more economical, as there are less frictional and heat losses. A great deal depends upon the carburetor and governor. An auto engine at 1,500 R. P. M. will not develop twice as much power as when running 750, as the mean effective pressure is less at high speed. The engine does not have time to take in as heavy a charge at high speed and the explosion does not act as strongly on the rapidly moving piston as on the piston moving more slowly. The auto engine of the above size would pull the separator, but a heavy duty engine would be better for the purpose. About 1,000 R. P. M. is a safe speed for the average auto engine.

A Rip Saw Carriage.

I have a cord wood saw frame with a tilting table that I wish to build over so that I can saw larger timber without requiring a man to hold up the end. I also wish to use a rip saw for sawing out boards. I wish to make an outfit that I can use either as a cut off or a rip saw. I think I will need a carriage that I can run either way. I want the whole thing small enough to place on a farm truck, having a three-horse-power engine on the front end. I have been using a twenty-six-inch cut off saw, the balance wheel weighing sixty pounds. With a heavier balance wheel I think I can use a thirty-two-inch saw. How large a rip saw can I use?

Answer.—As this outfit requires considerable detail designing we will not be able to give you much positive information. We suggest that you arrange an extension to your swinging table somewhat over half the length of the longest poles you wish to saw. For your log sawing carriage we suggest an outfit somewhat like the one shown by Figure 1 and Figure 2, Figure 1 being the top view and Figure 2 a sectional view showing the carriage drive disks. In the figures J is the saw countershaft, F is the flywheel, B is the belt pulley, C is the carriage, P is the carriage drive pinion, R the carriage rack meshing with

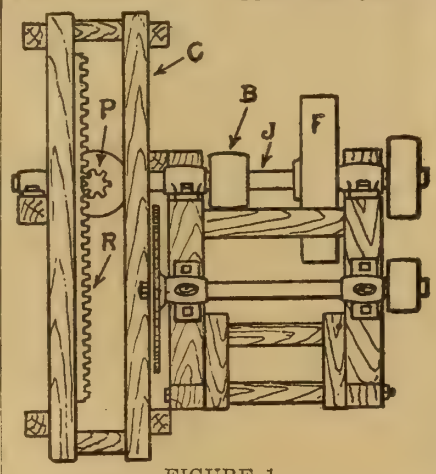


FIGURE 1.

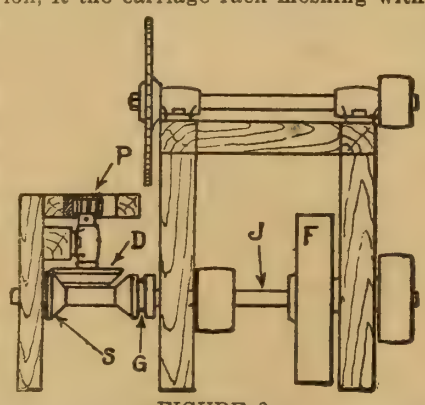

FIGURE 2.

the pinion P, G is a groove for the shifting fork that slides the two bevel disks, S, which are mounted on a sleeve, sliding on the shaft J. The disks are driven by a feather key in shaft J. The pinion P is fastened to a vertical shaft, on the lower end of which is the large bevel disk D, which is driven either backward or forward by the small bevel disks S. The disks should be made of paper or leather. The small disks may be made of iron. Gears should not be used. The sawyer controls the motion of the carriage by means of a lever that shifts the small disks S.

We doubt that your engine would pull a thirty-two-inch saw successfully. You might use a twenty-eight-inch saw, but it is best not to overload your engine.

Lighting From Dry Cells.

How long will two dry cells connected in series, light a 2.7-volt light?

Answer.—That depends upon the candle power of the light. Unless the current consumed was considerably less than half an ampere the voltage of the cells would soon drop too low to operate the light. Using a one-half candle power light the battery might last five hours of continuous running.

Governor Works Badly.

The governor on my one and one-half horse power pumping engine is not satisfactory. I want to know if there is a carburetor that can be attached to it so that it will run about 700 revolutions per minute? I have no objection to spending a little money on it if I can make it govern satisfactorily. It appears to be a well-made little engine, but the governor has never worked properly.

Answer.—You can buy a small carburetor with a butterfly valve. Attach the butterfly valve lever to the controlling mechanism of the governor. A dealer in motorcycles can quote you prices on small carburetors. You should write direct to the manufacturer of your engine about your governor trouble. This manufacturer makes a specialty of high-grade, throttle-governed engines and doubtless will help you out of your trouble.

Ask your neighbor to subscribe for The Wisconsin Farmer.

Why Expect a Ton of Power from an Ounce of Gasoline

The power to drive the threshing machine is a most important factor in getting good results.

It must be steady, strong and sure.

For work at the belt the explosive engine does not yet successfully compete with steam without handicap in the shape of weight and bulk that is cumbersome.

The Nichols & Shepard Co. Recommend the Steam Tractor

For driving their Red River Special separator, and they build it in all sizes from 13 to 100 horse-power.

No better or more highly developed engine is made for all around farm purposes in regions where the use of steam can be practised with economy.

With Good Water and Good Fuel Use Steam

There is a lot of matter about the reliable work that is being done with the steam tractor of N. & S. Co. make to be found in the Home Edition of the Red River Special paper. One of your own neighbors may have written some mighty good reasons as to why he prefers to own one. Write for a copy and argue it out with him if you don't believe what he says. Ask for a Big Catalog when requesting your paper.

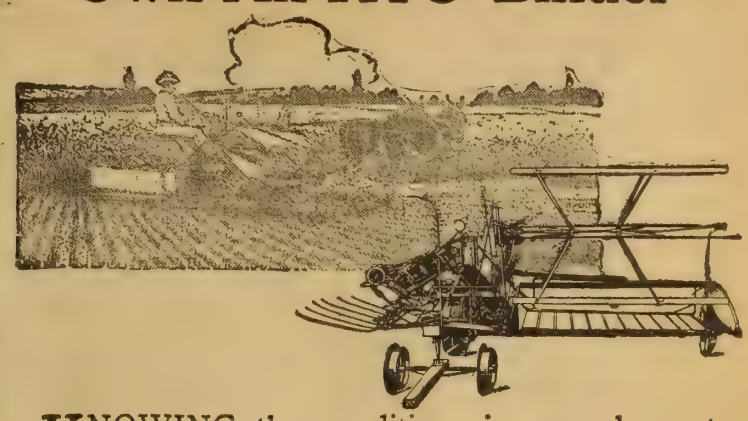
Own An IHC Binder



KNOWING the conditions in your harvest fields as well as you do, it will be an easy matter for you to pick out the right grain binder for your work. Note the details of construction—How is the main frame built? Is the main wheel large enough and wide enough to give plenty of traction? Is there a simple means provided for quickly and easily taking the strain off the canvas at night, or when the binder is out of use? Are ball and roller bearings provided to lighten the draft? Will the elevator take care of both light and heavy stands of grain? Is the knotter simple and sure in action? These are the things that count.

In the **I H C** binders—**Champion, Deering, McCormick, Milwaukee, Osborne** and **Plano**—these things and all other details are taken care of. Own an I H C binder.

The same arguments hold good for the twine you use. Ask for and insist upon getting an I H C twine, made to work in the binder you buy, and sold at the lowest price consistent with I H C quality.

Your local dealer can furnish you with I H C binders, repairs and twine. See him or write to us for complete information.

Four-Year Crop Rotations For Upper Wisconsin.

(Continued from April 27th.)

Four-year rotation with clover and timothy is one of the most popular rotations in Wisconsin. It differs from the three-year rotation described last week in that timothy is usually sown with the clover and the crop is cut for hay the second year. The rotation consists of small grain, mixed clover and timothy and some cultivated crop. Where land in permanent pasture is available for early pasturage the mixed clover and timothy is cut for hay and the field pastured until plowed in the fall. Where no permanent pasture can be had this mixed tivated crops. When necessary to help clover to "catch," it is applied to the grain crop. This rotation may be followed on all soils where clover does well. It is also possible to use soy beans as a substitute for clover, but in order to furnish pasture the next season it becomes necessary to sow rye after the soy bean crop is removed. The same suggestions regarding getting a clover catch also apply here. This rotation is probably not so well adapted to light as it is to loam and clay soils.

A COMMON FOUR-YEAR ROTATION.

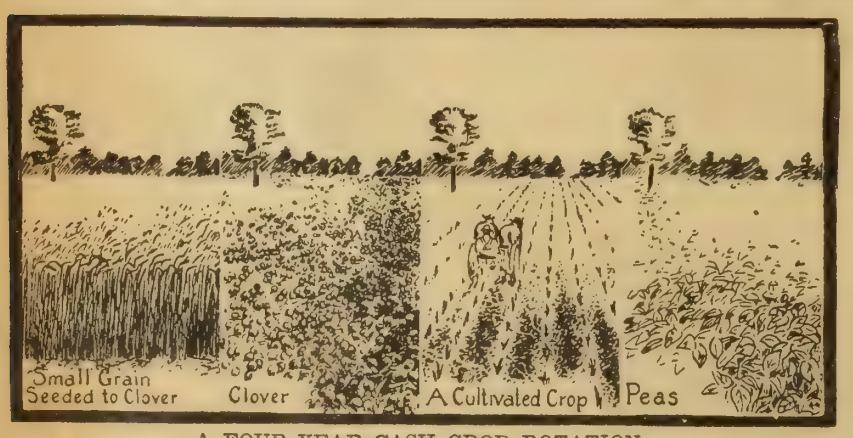
Field	First Year	Second Year	Third Year	Fourth Year
A	Clover	Mixed hay	Corn	Small grain
B	Mixed hay	Corn	Small grain	Clover
C	Corn	Small grain	Clover	Mixed hay
D	Small grain	Clover	Mixed hay	Corn

In localities where peas do well this rotation is often followed: Small grain, clover, mixed hay and peas. This rotation is well adapted to farms of good size on which dairying is not a specialty, but where small grain, grass and clover is used for pasturage. Under these conditions this rotation is well adapted to dairy farming and is well calculated to maintain soil fertility if little or no grain is sold from the farm.

A FOUR-YEAR ROTATION FOR A GRAIN FARM.

Field	First Year	Second Year	Third Year	Fourth Year
A	Small grain	Clover	Mixed hay	Peas
B	Clover	Mixed hay	Peas	Small grain
C	Mixed hay	Peas	Small grain	Clover
D	Peas	Small grain	Clover	Mixed hay

This four-year rotation is adapted to a wide range of conditions. It is particularly adapted to stock raising. The manure produced is usually applied to the sod land before corn or other cul- clover seed and peas are to be grown for market. Sheep can be kept and wintered profitably on the pea and clover straw produced. It is believed that this rotation may be followed with success on the heavy clay lands in the Lake Superior region and other sections where the crops named do well. More land is needed for this system than where dairy farming is practiced. Under these conditions sheep can be raised, for the lambing season is usually over before spring work begins.



A FOUR-YEAR CASH CROP ROTATION.

Field	First Year	Second Year	Third Year	Fourth Year
A	Small grain	Clover	Cultivated crop	Peas
B	Clover	Cultivated crop	Peas	Small grain
C	Cultivated crop	Peas	Small grain	Clover
D	Peas	Small grain	Clover	Cultivated crop

As this rotation draws heavily on the mineral matter of the soil, it will be necessary in order to permanently maintain the fertility of the soil to use phosphate fertilizers. Weeds can be kept down by working the pea stubble immediately after the crop is removed. This rotation provides for the maintenance of the nitrogen and humus supply. It can be operated with less help to the acre under cultivation than that which includes a cultivated crop.

Another four-year rotation which is well adapted where dairy farming is practiced is: Small grain, clover, cultivated crops and peas (as a cash crop). This rotation provides for a cultivated crop every four years, and on that account it is well adapted to sections where peas are grown, but where through faulty systems of farming, weeds have become troublesome. This system is well adapted to the older pea-growing regions.

In this rotation manure, as a rule, is applied to the cultivated crops. Where the soil is low in fertility all crops except peas should be fed on the farm. If the land has been heavily cropped to peas and small grain it may be necessary to use some phosphate fertilizer.

Views on Use of Tractor.

(Continued from page 12.)

oil, we will say that it costs 55 cents per acre, quoting gas at 18.5; with good traction and in the toughest ground one can average six to eight acres per day. Thus, fifty-five times seven is $3.85. So you see under the maximum expense rate the tractor is as profitable, if not more so than horses.

But you ask, how about the depreciation of machinery? I say, buy the right type, run it right, that is, use plenty of oil, fuel and keep the nuts tight, and the depreciation will be less than 5 per cent. Therefore, if you can't make over 5 per cent on your investment you had better leave it alone.

It is possible but very improbable that the tractor will entirely displace the horse. But the small farm tractor will easily take the place of from four to eight horses in the heavy spring work, besides its various other advantages. But it has come to stay and it only remains for time to give us the best type at the lowest price.

A. H. Dilley.

The Farm Tractor.

To the Editor:—I have given the farm tractor proposition considerable attention of late years and have come to the conclusion that the subject is well worthy of consideration. We have been working two farms of 360 acres the past four years and I have often thought that a tractor would be a good paying investment if we were assured of a dependable machine and a reasonable price for the fuel used.

In the first place, a dependable tractor and a small threshing machine would assure the farmer of getting his grain handled in the most practical way and to the best advantage. The grain itself would be worth more per bushel and the threshing bill saved besides. Then if a shredder could be added that would be another great advantage. A tractor would always be in demand for silo filling and for road grading it would be unexcelled. For plowing large fields I believe also it would be of considerable advantage and would hasten this kind of work very much, although I can see no advantage on small fields.

Where one farmer does not feel that it is a paying proposition to own a tractor alone it would be a very wise move for about four members to buy a tractor together. In this way they could get their work done up in good order and still receive a very good dividend on their investment when they figured up their benefits.

The price of a tractor would be rather a hard matter to decide, but if one can get the best for a difference of $100 or $200 such difference should not be allowed to stand in the way of getting a good machine. It is very much like buying a horse. It is not just the horse, but the value that is in it that really counts in the end. I certainly feel that we could make a good tractor a paying proposition on the land that we work.

There is another time in the past few years when I have been led to give the tractor considerable thought. That is when our grain had been in fine condition to be threshed for about a week or so and then got a soaking rain a few days or a week of it at a time, just because the threshing machine had not yet got to our place. Or if it actually did get there often the grain had to be threshed in an unfit condition simply because the neighbors were waiting for the machine. This came to my attention especially last fall when we had a fine field of oats get over a week of pretty steady rain when it could have been in the granary if we had been blessed with our own machine. Here was a case where over 3,000 bushels of oats lost from 5 to 10 cents' value through rain alone.

BEAVER DAM, WISCONSIN

Tractor Has Speed Advantage.

To the Editor:—I have a gas tractor which I use for hauling, threshing, sawing lumber and freighting, and, in fact, all sorts of work that I formerly used horses for. I use the gas tractor for road grading every year. While I do not find it quite as strong as horses, it makes up the loss in the speed. It will travel five miles an hour, drawing ten to fifteen ton load, and one man can handle it. It is a 20-40 and is estimated to weigh 13,000 pounds. I find that it does not pack the ground like a steam engine. In every line of work which I have tried this tractor in it has been very satisfactory in every way.

Iowa Co., Wis. Thos. F. Collins.

DAIRY

High-Producing Grade Holsteins.

The records of many cow-testing associations in Wisconsin speak wonders for the grade cows and the highest producing herd in the Waupaca and Butternut Ridge Cow-Testing Association last year proved a grade Holstein herd. This herd of eleven cows was owned and tested by Ira Farley, of Weyauwega, Waupaca county, and returned for him an average profit of $74.02.

The accompanying pictures show four of Mr. Farley's cows which made him a good profit and aided in enabling his herd to lead the association which has just entered upon its fourth year of testing with George L. Moss as official tester. Mr. Moss, in the April 27th issue of The Wisconsin Farmer, discussed the results of the last year's testing and pointed out how farmers who have been testing for many years have built up their herds because testing makes them take more interest in their cows. H.

Mr. Farley's native which has made him a profit of $335.33 in three years.

C. Frihart, president, says that he continues testing year after year, although he knows fairly well the performances of his cows, because he does not feel that he can afford to feed $600 to $700 worth of feed a year without knowing what his cows are giving him in return.

Mr. Farley's native, Brownie, who

Annie, five years, member of highest producing herd. Fat record, 461.8 pounds.

led the association with her individual production of 10,201 pounds of milk that made 549.4 pounds of fat, is ten years old and has been a consistent producer for years, as she has been in the association for three years and has returned a profit of $335.33 during that period. Her milk tested 5.38 per

Jessie, six years, (fat 443.1) which helped make the association record.

cent and in leading the association in production she produced more than 360 other cows. She consumed $29.82 worth of roughage and $37.79 worth of grain, making a total feed cost of $67.61 last year, bringing a net profit of $113.54, returning $2.68 for every dollar's worth of feed. She belongs

Bessie, six years. (Fat 441.2). Another profit maker for Mr. Farley.

in the herd that produced an average of 386.9 pounds of butter fat, with an average production of 9,182 pounds of milk from eleven cows testing 4.21 per cent. The gross income per cow is $125.83. The average cost of roughage is $28.73 and grain $23.08, making

Geo. L. Moss, Official Tester.

Manitowoc Cow-Testing Associations Reorganize.

The Manitowoc County Cow-Testing Associations, formerly known as the Nettle Hill and Manitowoc County Associations, were combined and reorganized for 1916. The name of the new association is "Manitowoc County Cow-Testing Association No. 1." The new organization has thirty-seven members and a total of 525 cows. At the recent meeting Adolph Otto was chosen president, Ferd Limburger is the new vice president and G. W. Keil is secretary-treasurer. The work was begun April 17th. One herd of this organization worthy of mention is that of Louis Geraldson, of Pinery Stock Farms, Manitowoc, Wisconsin. This herd consists of only twelve milk cows. All are registered and have made the following record for the month: No. 11, two year old, Pinery Ormsby Pontiac 250698 produced forty-five pounds of butter fat in twenty-five days, ending February 29th. This same cow produced forty-one pounds of fat for the month of March.

Mr. Geraldson was a member of the old association.

The facts contained herein are furnished The Wisconsin Farmer by H. R. Brewster, supervisor of tests:

Name and breed	Age	When fresh	Pounds milk	Per cent of fat	Pounds B. fat
Artasia N. P., R.H.	4	3-16-16	1728	4.0	69.1

THE HINMAN MILKER

The HINMAN Teat Cup combines the good features of human hand and nature's way.

Safe Simple Durable

teat cup is not a rubber sack, but simply a pure rubber ring slipped over a metal cup, easier to clean—more natural in action—very durable.

As the vacuum suction starts, rubber ring is drawn down, acting like the first finger in hand milking. As the gentle vacuum suction continues, teat is drawn against the side of the cup, much as the other three fingers act in hand milking. The whole principle is more like soft lips and mouth of a calf. The vacuum pressure is intermittently relieved in the same natural way so that circulation of blood is natural.

WRITE TODAY FOR OUR FREE CATALOG
It explains other features of HINMAN simplicity and superiority that not only explain why more HINMAN Milking Machines are sold than all other machines combined, but explains why its simplicity means its low cost.

Stanley Testing Report.

Mr. Richard F. Adams, official tester of the Stanley Co-operative Cow-Testing Association, sent us the forty-pound list for April, which is given herewith. Mr. Adams says the members are enthusiastic in the work and expect to have something tangible to show for their labors, at the end of the year. Interest is such in the Stanley neighborhood that those who are in the association and have tested cows, are beginning to realize results in a little better prices for their surplus stock. The members of the association are also taking up the matter of community buying of feed in carload lots and a considerable saving will be effected by this method. The testing report is as follows:

Richard F. Adams, Official Tester.
Frank Smalley, Secretary.

If the robin could testify for itself it would tell you that it much prefers elderberries to cherries, and that it likes mulberries or wild cherries best of all. So if you want to keep these birds out of your orchard, plant a mulberry or a wild cherry tree near by and the birds will forget all about your cultivated cherries.

The artichoke, which originally came from Barbary, is not a botanical species, but a variety of the thistle, which grows spontaneously all along the African coast of the Mediterranean from Morocco to Palestine.

TABER LINED SILO

Non-Shrinkable—Practically Everlasting, Rot-Proof, Worm-Proof, Storm-Proof, Acid-Proof.

SAFETY STORM BLAST LANTERN FREE

This Safety Lantern cannot catch fire or explode. It is absolutely safe at all times and on all occasions. If you drop it in the hay loft, no oil can escape; if the cow kicks it over, it goes out at once.

It cannot blow out in a cyclone because of the storm blast feature. It is just the kind of a lantern every farmer needs about the house and barn.

Patent opening device raises and swings the globe free for lighting, filling and trimming. This lantern is fully guaranteed and is endorsed by the highest authorities on fire insurance, fire fighting and explosives. If dropped or turned over it immediately goes out. Oil cannot run. Impossible to catch fire. A lantern you will always feel safe with in the house or barn.

OUR OFFER

Send $2.00 for a three year new or renewal subscription to The Wisconsin Farmer and we will send you one of these Safety Storm Blast Lanterns as a premium free and postpaid.

VETERINARY MATTERS

PROFESSIONAL Veterinary advice through this department to regular subscribers only. We do not answer veterinary inquiries for the benefit of "neighbors." Parties desiring information will be required to send their names in full with their address. No question will be answered by mail unless accompanied by a fee of one dollar. In order that correct information may be given, the symptoms should be accurately described, stating of how long standing, together with color and age of animal, and what treatment, if any, has been resorted to. All veterinary inquiries should be addressed to this office.

AILING ANIMALS.

Catarrhal Fever.

I have three horses which have been sick with catarrhal fever. Would you advise vaccination for a working horse? How should they be treated?

We would advise the use of anti-toxin as a preventive in those not affected, and as an aid in hastening recovery and avoiding complications in those affected. Those which have severe cough and heart and bowel irregularities should be specially treated. Animals affected should have the best of care and should be kept from work. The anti-toxin should be administered by a veterinarian.

Collar Bruise.

I have a ten-year-old mare that has a swollen place on her shoulder about half way between the point of her shoulder and the top of her neck. This is as large as a man's hand and was caused from the collar. It doesn't seem much sore, but doesn't get any better. Would like to know what to do for it. I need her work very much and would like to find some remedy for this swelling.

Your horse is troubled with a collar bruise and it should have been opened and contents let drain out. You had, by all means, better have a veterinarian open this and see that good drainage is established, as it will not get well till this is done.

Ringbone.

Please tell me treatment and cure for ringbone on horse's front foot. They tell me there are two kinds, high and low. This has been on the horse about six months.

Ringbones are known as low down and high up ringbone. You should clip the hair off the affected parts and apply the following blister: Biniodide of mercury, two drams; vaseline, one ounce. This is enough to blister an ordinary ringbone two or three times. Apply one-third of the blister, rub in thoroughly and grease the third day after blistering. Continue blistering every four weeks till cured. If this does not effect a cure have your veterinarian fire him.

Unable to Eat Naturally.

I have a yearling Holstein heifer that c not eat off the ground unless she gets on her knees. It seems to be in her back. Have tried no treatment, as I do not know what is the matter with her. She is in perfect health otherwise. I do not think it is habit, as she has be n this way for about two months. Any information will be appreciated.

We would not attempt to say just what the cause of the trouble in this case is. There might be a number of conditions, any one of which could cause this animal to be troubled this way. We would advise you to obtain the services of a competent veterinarian and he can, in all probability, tell you what is causing the trouble after looking the animal over carefully.

Sore Mouths in Pigs.

I would like to know what ails my little pigs. They are about three weeks old and they have sore mouths. Most of them get yellowish growths inside their mouths, mostly on the outside of the jaws. Some are affected around the eyes and a few under the belly. I have heard some people say it is a kind of cancer. What causes this and what cure is there for it, if any?

Since a number of your pigs have this it must be of an infectious nature and should be treated as such. If any of these places break and discharge pus or fluid it should be cleaned off and washed with a 2 per cent solution of creolin or lysol. This wash should be applied to all parts affected, being careful not to let any of the fluid enter the eyes while treating around them.

Chronic Cough.

I have a ten-year-old horse that has a bad cough. The cough is dry and at times the horse puffs a little as if he might be getting the heaves. What treatment could you give, if any? This horse had distemper a year ago last winter. There was a little swelling under his neck at the time, but it did not break through. Do you think that this would cause him to cough now? I have been feeding him oats and a little corn and timothy hay. He is in good condition.

Your animal probably contracted his cough at the time he was affected with distemper and it has now become chronic. Would advise you to feed l ss hay to your animal, water more often and not let fill too much at a time. Administer daily with syringe one-half ounce of solution of potassium arsenate U. S. P. This should be diluted with a half pint of water before giving. If this is continued over considerable length of time results may be obtained.

Unsuccessful efforts were made in the senate to amend the Shackelford-Bankhead Good Roads bill so that 25 per cent instead of the cost of roads to be built under the bill would be borne by the federal government. Senators Shaforth and Norris led the fight for a reduction. The only roll call showed only eleven senators for it and thirty-six against.

ATLAS EXPLOSIVES

Blow Out Those Stumps It's Easy, Quick, Cheap

"Farm Powder is the easiest, quickest and cheapest means of removing stumps," repeated tests have proved. The Minnesota Experiment Station found explosives "blew stumps entirely out and broke them into pieces easily handled." Clear your stump land with

Atlas Farm Powder

THE SAFEST EXPLOSIVE

The Original Farm Powder

—Made especially for farm use and sold by dealers near you. Convenient—costs little—no experience needed—no money tied up in expensive tools. It will help you make idle acres pay a profit.

Use it to blast holes for tree-planting and watch the trees outgrow those planted with a spade. Use it for subsoiling or for digging ditches. It is the cheapest, fastest, hardest working farm hand you can get.

Send Coupon for Farm Book—FREE

Our illustrated book "Better Farming" will be helpful to every land owner. It shows how to improve soil, raise bigger crops, blast stumps and boulders, and do all kinds of work with Atlas Farm Powder. Mail the coupon *now*.

Cut Down the Routine Work.

In a recent talk on housekeeping Miss Stella Mather, lecturer in the extension division of the Kansas State Agricultural College, declared that a housekeeper can reduce by one-half the amount of labor expended in the regular routine of duties.

According to Miss Mather this can be accomplished by making out a schedule of the various tasks to be done each day. Plan all the things that have to be done every day and also those that must be done but once a week, estimate the length of time required for each duty and give allowance for that time in the schedule.

The planning of meals in advance will save a lot of unnecessary hurry and flurry at meal time.

It saves time to note the contents of the refrigerator and make use of the leftovers in planning meals. Desserts may be prepared in the morning. The use of the fireless cooker saves time. Cereal for breakfast may be started the night before and also such fruits as prunes, and even rice for luncheon the following noon.

The importance of having a definite place for every utensil and all food materials so that no time is lost in looking for things, is emphasized my Miss Mather.

How to Cook Tough Meat.

Tough meat, because never included in the choice cuts of a carcass, is often thought to be of little value for food. Indeed, meat from those muscles which are used the most by the animal contains more nourishment than the most tender portions if it is properly cooked.

The main factor to keep in mind when cooking tough meat is to break up the connective tissues and at the same time keep the juices. The round or rump and the extreme ends of the shanks are tough, but rich in juices.

An appetizing dish for dinner is braised beef. Take about three pounds of rump beef, wipe and sprinkle with salt and pepper and dredge with flour. Brown in a skillet or kettle, using pork fat in the frying, and be careful when turning the meat so as not to pierce the surface, for this allows the juice to escape. When the entire surface is well browned place in a roaster or earthen casserole and surround with one-fourth cup each of carrot, turnip, onion and celery cut into dice. Also add one-half teaspoonful pepper corns and pour in three or four cups of boiling water. Cover and bake four hours in a slow oven, basting every half hour and turning once during baking. Gravy may be made from the liquor in the pan.

Chicken may also be braised. The whole vegetables, if small, may be placed in the pan.

Boiled meat need not be tasteless and ragged looking if properly handled. An old chicken may be made palatable by boiling in just enough water to cover until quite tender, but not falling away from the bones. It is then placed in the oven and roasted until thoroughly done. The browning of the surface may be accomplished by leaving off the cover of the pan for fifteen or twenty minutes. Or the chicken may be boiled, then cut up as for frying, dredged with salt, pepper and flour and pan broiled until tender. This makes it as nice as spring chicken and more economical.

Boiling ham may have one-half cup of vinegar added to each quart of boiling water to help make it more tender and palatable. It may first be boiled for two hours then removed, skinned and the surface sprinkled with salt and pepper and covered with bread crumbs moistened with vinegar. It is then baked until tender. As is true of other meats, properly roasted ham requires fifteen minutes for each inch of thickness.—[Margaret Harris.

Successful Country Club.

To the Editor:—I would like to tell your readers about a Mothers' Neighborhood Club and a Girls' Country Club that have been organized in the rural districts adjoining Wesley Chapel, a country church located six miles northeast of Mt. Pleasant, Iowa. The organization of these two clubs was made possible through the efficient leadership of one of our number, Mrs. Robert Willits.

The Mothers' Neighborhood Club was organized in February and has held but two meetings, but much has already been accomplished. Through the efforts of this club interest has been aroused in a consolidated school for four school districts. A petition has already been circulated, with scarcely any opposition, and in all probability before many months have passed the pupils will be enjoying the advantages of a fine, modern, accredited school.

The club has also decided to have dental inspection in the schools.

They meet once a month at the home of a member. A program is previously arranged and all join heartily in discussions of subjects of vital interest to home and school. Socially, it has proven to be a splendid way for the women of the neighborhood to become better acquainted. By means of socials, entertainments, etc., they expect to raise money with which to purchase various things for the benefit of the schools.

The club has a president, secretary and treasurer, and each of the four districts has a vice president and a program and refreshment committee. A picnic is planned, to be held the last day of school.

Through the efforts of the club a Parent-Teachers' Association has been organized in each district. Meetings are held at the school buildings once a month during the school year. These meetings consist of music, readings, papers and discussions of school problems.

The Girls' Country Club was organized a year ago. There are about twenty members, girls from twelve to twenty years of age. Meetings are held once a month. The object of the club is to promote a better social life among the rural young people of Wesley vicinity.

They have given Halloween and April fool parties to which the young men were invited. Last September a mock fair was held at the Willits home and the girls netted a neat sun. All the attractions of a fair were in evidence—stands, fortune-telling tent, exhibition tent, baby rack and even a band. A program was given on the front porch, consisting mostly of quartet music, tableaux and pantomimes. The fair was held at night. A large crowd was present and many expressed a wish that it might become an annual event.

FEEDING THE DUCKS IS NO FUN.

The girls are planning to buy a tennis outfit for summer recreation and will dress alike in white middy suits. The club colors are green and white.

If their plans mature the club expects to hold a festival in May and give the May pole and other drills. They will have stands and devise other ways of earning money, as they hope to present Wesley church with a piano.

The young people are certainly having nice times and much credit is due Mrs. Willits, who is patroness of the club and helps them in all their plans. Mrs. Jessie Farquer.

Mrs. J. D. Comes Again.

To the Editor:—I noticed in a recent issue that one of your readers, Mrs. W. B., wants more information as to how I cured my headaches through osteopathy and I am glad, indeed, to tell her and others all I can if it will only help them.

From my own experience, I am afraid that Mrs. W. B. did not keep at the treatment long enough, as she says she only took fifteen treatments. I do not know just how many treatments I took, but I kept steadily at it for several months. Maybe I could have stopped sooner than I did but I was so determined to give it a good trial and was so satisfied with the results obtained from the first that I was loath to give it up, and kept right on. I do not think I lost anything by it, and even now if I feel a little run down I take a few treatments just to be on the safe side.

Mrs. W. B. asks if I had sick headaches or "just a common headache." Well, maybe it was "just a common headache," but just the same I have gone to bed with them many a time, and I never want any worse headache than "just a common" one. And when I did go to bed they would get better so I think the rest helped, but the treatments did more than just help—they cured me.

I wish Mrs. W. B. would take my advice and keep on with the osteopathy. If she found relief at all that surely is a good sign. It doesn't seem to me fifteen treatments is much of a trial. You wouldn't expect fifteen doses of medicine to cure an ailment you had had for years, would you? Maybe I am overenthusiastic, but really I believe osteopathy and rest will do wonders for some of us headachy women folks. Mrs. J. D.

Lemon and Salt For Rust.

To the Editor:—I would like to send a very simple remedy to the lady who asked how to remove rust from clothes, and it is well worth remembering.

Cover the rust spots with salt and lemon juice and lay it in the sunshine or hold it over steam from the spout of the teakettle. If one application does not remove all the rust, try it again.

To bleach linens that have become yellow add a tablespoonful of turpentine to the suds in which you boil the clothes. A Reader.

Another Rust Remedy.

To the Editor:—I enjoy reading the Home page and as I have received help from it I wish to help others. If the lady wishing to remove rust from clothes will put 10 cents' worth of tartaric acid in from one to one a half gallons of water in a stone jar, place clothes in it and leave overnight the rust will disappear when rinsed in clear water. I took rust from a pink dress with this and did not spoil the pink, as I feared it would.

To restore color in woolen goods where fish brine or substances have caused it to fade in streaks place 10 cents' worth of aqua ammonia in one to one and a half gallons of water. Place garment in same for half an hour or so. Then hang up to dry. I treated a skirt in this way. I had thought it was entirely ruined but could not tell where the streaks had been when dry and pressed. If smaller spots are to be treated, mix a small amount and wet faded spots.

Mrs. C. C. Brooks.

Alum For Bugs and Roaches.

To the Editor:—I saw a request for getting rid of bed bugs and will give a method I have used and have never failed to get rid of them.

Take alum and dissolve two-thirds of a teacupful in one gallon of boiling water. Let stand on the stove until all the alum is dissolved. Use a clean oil can and squirt this alum water into all cracks, holes in the walls, under and behind baseboards if they are loose, around the edges of carpets, on bedsteads, mattresses, in fact any place where they bother. Do this before papering and no bugs will be

found behind the paper. This is a clean method, leaves no odor and will not fade carpets, etc.

This will also rid cupboards, sinks, etc., of ants, cockroaches, etc. Either sprinkle the pulverized alum or wash the shelves with the alum water, leaving it to dry without wiping.

Mrs. E. U. R.

Remedy For Roaches.

To the Editor:—In regard to Mrs. S. W. Z.'s inquiry for some way to exterminate roaches I want to say that I have found a generous sprinkling of borax very successful. L. G.

How Do You Can Ground Cherries?

To the Editor:—I would like a little advice about growing and canning ground cherries. Mine are always very late in coming and I would like

GRETCHEN GERTRUDE GILCHRIST AND HERSELF.

to know how others grow them, and also how they can them. Do you take the stone out or not? I would also like to know how to can gooseberries for sauce. It is soon coming time to put up fruit and I want to know how to do it before the season is here.

Mrs. H. E. O.

When Buying Wall Paper Remember.

A figured paper always makes the room appear smaller than does a plain paper.

Red absorbs more light than any other color and should never be used in a small or dark room. As a rule, it is a poor color to pick in buying wallpaper.

Yellow adds light and warmth and should be used in rooms having northern exposure.

Green or blue should be used in rooms having much sunshine.

Pink of a light shade adds light and warmth to a room.

Wallpaper should be light or dark enough to make a good background for the furniture. The design should never be prominent enough to compete with the furniture or people.

Honey, as an article of food, has a value that is well established and unquestionable. Apart from its pleasing taste and odor, it has specific qualities that entitle it to a high place in the list of natural food products. After it has been collected it does not need to be subjected to any additional treatment to be made fit for use; it is in reality a "natural" product. Its use as such has been known from the earliest times, and its popularity will undoubtedly remain unimpaired while the need for human food endures.

In Jamaica there are trees called the "whip trees," and from these the natives make strong whips with the lash and handle all in one.

Recipes.

Boiled Pot Roast.—Three and a half pounds from the round, one and a half pints of water, one level tablespoonful of salt, one tablespoonful of sliced onion, six whole cloves, one-fourth level teaspoonful nutmeg, two bay leaves, one-half level teaspoonful of white pepper, two tablespoonfuls bacon fat or lard. Place the fat in the frying pan. When hot add the meat and brown thoroughly on all sides. Place the water in a stew kettle and when boiling add the meat. Pour in also any gravy which is left in the frying pan. Lower the fire or set on back of range, add the salt, onion, cloves, nutmeg, bay leaves and pepper. Cook slowly for two hours. Keep covered. The meat may be served hot or cold and the meatstock used for soup.

Horseradish Sauce for Hot Beef.—One tablespoonful of butter, one level tablespoonful of browned flour, one-fourth level teaspoonful of salt, one cup of meat stock, one-half teaspoonful of chopped parsley, two tablespoonfuls horseradish. Melt the butter, add the flour and mix thoroughly. Add the salt and the meatstock. Boil three minutes. Add the parsley and horseradish. Pour the sauce around the meat.

Lemon Mock Mince.—One pound of raisins. Pour over them one quart of boiling water. Let them stand on the stove and simmer. Juice of two lemons, two teacupfuls of sugar, two well-beaten eggs, three tablespoonfuls of flour. Stir the lemons, eggs, sugar and flour together. Add to the raisins and cook a few minutes. This will make three large pies.—Mrs. R. H. L.

Strawberry Charlotte.—Make a boiled custard with one quart of milk, yolks of six eggs and three-fourths of a cupful of sugar. Flavor to taste. Line a glass dish with slices of sponge cake dipped in sweet cream. Lay on them ripe strawberries sweetened to taste, then a layer of cake and strawberries as before. When the custard is cold pour over the whole. Then beat the whites of the eggs to a stiff froth, add a little sugar and put over the top. Decorate with ripe strawberries.—Mrs. H. G.

Mince Meat.—To one quart of cooked, chopped meat (I use tenderloin) add two quarts chopped apples, one quart measure of sugar, one pound chopped suet, one cup vinegar, one cup molasses, one teaspoonful nutmeg, one tablespoonful allspice, two tablespoonfuls cinnamon, one-half tablespoonful cloves, one pound raisins, one pound currants and juice of one or more lemons. If it is too dry, add water and cook until currants and raisins are done. Then put in jars and seal. If the tops of the jars are filled with boiling water the mince meat will not spoil nor become dry.—Mrs. H. J. P.

Lyonnaise Eggs.—Chop fine one small onion and cook it without browning in butter for ten minutes; then stir in a tablespoonful of flour and cook until it froths. Add one and one-half cupfuls of milk and stir while cooking three minutes. Season with a half teaspoonful of salt and two dashes of pepper. When sauce is thick and smooth pour it into a deep, hot plate and carefully break in six eggs; sprinkle buttered bread crumbs over the eggs, set dish in oven and bake until eggs are set. Serve at once.

Just Remember It.

Every household should possess a good electric flash light. It is invaluable to the mother when there are little children and she often has to get up at night. Flash it into the medicine cabinet and there will be no tragedies of mistaken bottles gotten in the dark. Even in the daytime it is handy to look into dark closets, attics, drawers or dark corners. The beauty of it is that one may throw a strong light just where it is needed without a particle of danger from fire. You may even flash it into the gasoline tank with safety.

An excellent remedy for mildew is to saturate an article with kerosene. Roll it up and let it stand for twenty-four hours and then wash in very hot soapsuds.

Never sun feather beds or feather pillows. Air them on a windy day in a cool place. The sun draws the oil and the feathers will have a rancid smell if they remain in the sun.

Brown boots and shoes should be rubbed over with a slice of raw potato before the polish is applied. This will clean and remove the stains.

Warm a lemon before squeezing it and you will get much more juice.

A spoonful of vinegar will set a poached egg.

Do not have too hot an oven when baking custard, or the custard will become watery. Set the custard in a pan of hot water and be sure the water does not boil during the cooking.

HOME ENTERTAINMENT AND GREAT CASH PRIZES

An Example Picture

Today's Magazine is presenting a home game to everybody—a game that consists of 32 plain pictures. One of them is shown below. A list of titles is printed, and offered to all. You simply look over this list, and pick out titles to fit the 32 pictures. Those submitting the titles that fit the pictures best will be awarded $3,500.00 in cash.

That picture to the left is an example picture, to show you how the game is played. We think it is fitted very well by "An Old Fashioned Girl," which is one of the titles in the list you will have. The girl is dressed in old-fashioned clothes, and that title is the best one in the list for the picture.

A Regular Picture

Here is one of the regular Picturegame pictures. Couldn't you look through the list of titles, and pick out one that would fit this picture? There is no reason why **you,** in a few evenings of absorbing amusement, should not pick out of the list the titles that fit all the 32 pictures best—that make the best **names** for the pictures.

No knowledge of any kind is needed—you just use your common sense in deciding which titles make the best names for the pictures.

There isn't any work whatever connected with the Picturegame in any way. There isn't any soliciting or canvassing required. This is what Today's Magazine says it is—a home game for all the family to play for their great entertainment. A way is provided for free participation, without one cent of expense.

Send in the coupon to the right, and then you'll know all about how to play, and satisfy yourself that this is a game for you. We know you'll be delighted to play, and you may use your common sense so well that you'll win first prize, $1,000.00 in cash. That rests with you!

$3,500 CASH—419 PRIZES
1st prize, $1,000; 2d prize, $625; 3d prize, $350; 4th prize, $250. 419 cash prizes in all, total $3,500.

$3,500 Game Information Card
Picturegame Editor,
Today's Magazine
461 Fourth Avenue, New York, N. Y.

Please send me immediately, free of charge, full Rules and complete explanation and illustrated description of the $3,500 Cash Picturegame. I understand this is just a game, with no work connected with it in any way.

THE YOUNG FOLKS

All letters from boys and girls to this department should be sent to office of The Wisconsin Farmer, Madison, Wisconsin.

Blue Beard.

Dear Young Folks:—I read your letters every week and I like them very much. I am going to write one of the fairy tales I like to tell. It is about Blue Beard.

Blue Beard was a lord and had a very large castle. One day he came to a little house and asked if he could come in.

They let him in and he said he

MOTHER'S HELPERS.

wanted one of the two girls who lived there to be his wife. He chose the younger and took her and the rest of the family to his castle.

One day Blue Beard and his men went hunting and Blue Beard gave the keys to his wife and told her not to unlock a certain door.

But after he had gone his wife's sister took the keys and opened the door. There in the room were his other seven wives. They had been killed and there was blood all over the floor. Some were hanging by their hair and others did not have any heads. When they looked for the key they found it in the blood on the floor.

They picked up the key and tried to rub the blood off, but they could not.

When Blue Beard came in he saw his wife and her sister white with terror. He asked what was the matter, but they would not tell. But he told his wife if she did not tell he would kill her, so her sister said, "I took the keys and unlocked the door."

Blue Beard was so angry that he took his sword and said he was going

FILET CROCHET
100 DESIGNS
In Book Form

This book contains over one hundred of the most beautiful, practical, prettiest, newest and oldest designs of Filet Crochet and Cross Stitch ever published.

This Splendid, Handsomely Illustrated Book includes everything from the simplest to the most intricate and exquisite designs.

Yokes and Towels

With the beautiful illustrations and simple instructions all designs can easily be worked by novice or expert.

Complete Book, Including Postage and Packing **Only 12c.**

PEARL LeMONDE,
309 Publicity Building, ST. LOUIS, MO.

HOME CANNERS

CUT your living expense and make ready money besides, with our patented, economical, scientific heating outfits. Prices very resonable. Catalog free. Home Canner Manufacturing Company, Alexandria, Minn.

FARMER AGENTS write for 1916 agency for Diddie-Blitzen Rods. Best Lightning Rod sold. L. F. Diddie Co., Marshfield, Wis.

to kill his wife. She begged him to let her have one minute, and this he promised her, but no more.

The girls went to the window and when they looked out they saw their brothers coming.

When the brothers came and saw Blue Beard ready to kill their sister they killed him instead and their sister became the ruler of the land.

—Vivian.

Helps Mother With Work.

Dear Young Folks:—May I join your circle? I am a girl nine years old. I live on a farm and have four black kittens for pets. I have three sisters. One is teaching, one is in high school and the other is in the state university. I also have three brothers. One is in high school and the other two are at home.

I help mamma with her work. I set the table, wash and wipe the dishes and sometimes sweep. I feed the little chickens and help my brother gather the eggs.

I have been taking music lessons from mamma.

I would rather get the mail on Friday than any other day of the week, because that is the day we get the paper. —Ida.

Had Fun in the Ocean.

Dear Young Folks:—I enjoy your letters very much and I am going to tell you about my trip to California. Mamma and I went to California last fall. We went to see my grandpa who lives at Long Beach. We were at Los Angeles, San Diego and San Pedro.

I had a very fine time. We went down on the beach every afternoon. I rode on the merry-go-round every day and was in the ocean two or three times.

When we went down to San Diego we went to the fair and I saw a cow and milkmaid made of butter. They had electric cars at the fair and you had to pay $1 an hour for them. There were Indians there, too.

Some time when I write again I will tell you more about my trip.

—Lillian.

Makes Useful Things at School.

Dear Young Folks:—I live on a farm near a little village. I am twelve years old and am in the eighth grade.

We take several farm papers and I like to read the Young Folk's page very much.

We have six horses and their names are Daisy, Colonel, Rock, Queen, Bell and Dake. I also have a pet dog. His name is Rover. He usually comes to meet me when I come from school.

I have made several things at school in manual training this year. I have made a sled, bird house, footstool, milk stool and a seed tester.

—Melvin.

The Lost Doll.

I once had a sweet little doll, dears,
The prettiest doll in the world;
Her cheeks were so red and so white, dears,
And her hair was so charmingly curled.

But I lost my poor little doll, dears,
As I played on the heath one day;
And I cried for more than a week, dears,
But I never could find where she lay.

I found my poor little doll, dears,
As I played on the heath one day:
Folks say she is terribly changed, dears,
For her paint is all washed away.

And her arms trodden off by the cows, dears,
And her hair is not the least bit curled;
Yet for old sake's sake, she is still, dears,
The prettiest doll in the world.

—Charles Kingsley.

International Sunday School Lesson.

Lesson for May 14, 1916.

(By E. O. SELLERS, Acting Director of Sunday School Course.)

"Lo, We Turn to the Gentiles."

LESSON TEXT—Acts 12:13-52.

GOLDEN TEXT—I have set thee for a light of the Gentiles, that thou shouldest be for salvation unto the uttermost part of the earth.—Acts 13:47.

In the unfolding and ever-widening of the program of power we are again confronted with a crucial event. It is suggestive that at this time Paul, whose name has just been changed from Saul, now assumes his place of leadership, succeeding Barnabas. Perga, the capital of Pamphylia, was on the southern coast of Asia Minor, and Antioch, the capital of Pisidia (southern Galatia) was ninety miles north. Paul is now in full control and no other man save our Lord has so deeply impressed human history.

I. Paul's Opening (vv. 13-15). We are not told why John Mark returned to Jerusalem. He may have objected to the changed leadership; there may have been sickness involved; as a Jew he may have objected to Paul's actions. His subsequent missionary zeal restored him to Paul's favor (II. Tim. 4:11). Departing from Perga (v. 14), perhaps on account of an attack of fever (Gal. 4:13, 14), the party ascended to the higher altitude of the important city of Antioch, the site of which is now marked by extensive and impressive ruins. After finding lodgings they repaired to the synagogue on the Sabbath day. Here they could meet the people and would be given opportunity to speak of Jesus. Paul put himself in the way of opportunity and opportunity beckoned to him. They did not demand this privilege because they were Christian workers. Their participation in the service and other actions commended them to the respect of the leaders of the synagogue, which was the great democratic forum of the Jewish nation.

II. Paul's Sermon (vv. 16-41). Paul began his remarks, even as Peter did at Pentecost, by quoting the Old Testament, and referring to Jewish history, using the same to lead up to his testimony about Jesus. (Matt. 5:17.) "It is ours to show wherein Christ fulfilled the law, the obligation resting upon us by reason of his covenant of grace, and the blessings which issue therefrom." This is one of Paul's three recorded missionary sermons (see also Acts 14:15-18; 17:22-31). The last two were to Gentiles only. This is a scriptural discourse. (1) Messiah's people and ancestry (17-23); (2) Messiah's forerunner (24, 25); Messiah rejected (26-29); (4) Messiah risen from the dead (30-37); (5) Jesus the Justifier (38-39); (6) the application, a word of warning (40, 41). There must have been some evidence of restlessness in his audience, hence his sharp warning (41).

III. Paul's Decision (vv. 42-47). After the separation of Jews from Greek proselytes the latter besought Paul to continue his testimony literally "the Sabbath between," perhaps at the midweek meetings. Questions and discussions were the order in the breaking up of the synagogue service, and as Paul and his company departed they were accompanied by some who had believed (v. 43). Knowing the testing which would follow, Paul and Barnabas did personal work with these, exhorting to steadfastness (John 8:31, 32; Col. 1:23) in the grace of God (v. 38, 39; Rom. 3:24; Eph. 2:8). It is only in grace that any are able to "continue" (Rom. 5:2; Gal. 5:1, 4). It is personal work which gathers a crowd and such was the method of Paul and Barnabas during the intervening week. So well was the work done and so great was the power of their testimony that "almost the whole city" gathered the next Sabbath to "hear the Word of God." Such evident interest in this new teaching aroused the jealousy of the Jews. Years of Jewish proselyting had never secured such a result as this one address of a doubtful stranger produced. But back of this jealousy was the greater sin of unbelief. To hear the Word of God (II Titus 4:2; I Thess. 2:13) does not necessarily produce obedience and faith (Luke 8:5-7); not always the greatest number of hearers will produce the greatest number of conversions. To interrupt a speaker is not unknown in synagogues today. The opponents "contradicted and blasphemed," doubtless contending that all who hang on a tree are accursed (Gal. 3:13) and they produced a wild tempest of voice and confusion. Only to attack and to destroy the work of Paul and Barnabas could save these Jewish leaders. Human nature is the same everywhere.

Paul and Barnabas thrived upon opposition. We believe they foresaw this development and were prepared for the emergency (v. 46). Because of long training the Jews were best fitted to receive the Gospel. It was no accident that the first apostles were Jews, but it is serious business to reject the Christ, and the history of the Jewish nation since rejecting Jesus has been written in blood and tears. Paul's "Lo we turn" (v. 46) marked the Rubicon of spiritual history. Christianity is to become world wide, not by means of the Jews, but in spite of them.

OUR FASHION DEPARTMENT.

ALL PATTERNS, 10 Cents Each.

THIS department is prepared especially for The Wisconsin Farmer. We can supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10 cents each, postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering, all you have to do is to write your name and address plainly, tell us the correct number and size of each pattern you want and inclose 10 cents for each number. We agree to fill all orders promptly and guarantee safe delivery.

CATALOG OF SPRING AND SUMMER FASHIONS.

Send 10 cents in silver or stamps for our up-to-date 1916 large spring and summer catalog, containing over 400 designs of ladies', misses' and children's patterns, as well as the latest embroidery designs, also a concise and comprehensive article on dressmaking, giving valuable hints to the home dressmaker. Address all orders for patterns and catalogs to THE WISCONSIN FARMER, MADISON, WISCONSIN.

1351—Dress for misses and small women, with or without bolero, with two styles of sleeve, and with skirt in raised or normal waistline. The pattern is cut in three sizes: 16, 18 and 20 years. It requires 7½ yards of 27-inch material for an 18-year size, with one yard for bolero.

1387—Girls' dress with middy blouse, having sleeve in either of two lengths, and with separate skirt, joined to an underwaist. The pattern is cut in five sizes: 6, 8, 10, 12 and 14 years. It requires 3⅞ yards of 36-inch material for a 10-year size.

1596—Ladies' home or morning dress. This model has a four-gore skirt. The pattern is cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. It requires 6⅜ yards of 36-inch material for a 36-inch size.

1704—Girls, dress (to be closed in front or slipped over the head). The pattern is cut in four sizes: 4, 6, 8 and 10 years. It requires 3½ yards of 36-inch material for an 8-year size.

Waist 1700-Skirt 1699—Ladies' costume. Waist 1700 cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Skirt 1699 cut in six sizes: 22, 24, 26, 28, 30 and 32 inches waist measure. The entire dress requires 7¾ yards of 44-inch material for a medium size. Two separate patterns, 10 cents for each pattern.

1714—Girls' one-piece dress. The pattern is cut in five sizes: 4, 6, 8, 10 and 12 years. It requires 3½ yards of 27-inch material for a 10-year size.

1711—Ladies' and misses' bathing suit (with bloomers). The pattern is cut in three sizes: For misses, 16, 18 and 20 years, and in five sizes for ladies, 36, 38, 40, 42 and 44 inches bust measure. It requires 3½ yards of 44-inch material for an 18-year size. Size 38 would require 3¾ yards.

1705—Girls' dress with long sleeve finished with a cuff, or with sleeve in short puff style. The pattern is cut in five sizes: 4, 6, 8, 10 and 12 years. It requires 3¼ yards of 40-inch material for an 8-year size.

1708—Ladies' apron. A practical and serviceable model. The pattern is cut in three sizes: Small, medium and large. It requires 4½ yards of 36-inch material for a medium size.

1671—Ladies' middy blouse with sleeve in either of two lengths. The pattern is cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. It requires 3 yards of 44-inch material for a 36-inch size.

1586—Ladies' dressing or house sack, a very serviceable and comfortable garment. The pattern is cut in six sizes: 32, 34, 36, 38, 40 and 42 inches bust measure. Size 36 will require 3¼ yards of 44-inch material.

1717—A smart frock in tailored style for ladies, with sleeve in either of two lengths. The pattern is cut in six sizes: 32, 34, 36, 38, 40 and 42 inches bust measure. It requires six yards of 44-inch material for a 36-inch size.

HEPSEY BURKE--A Sister to David Harum

By G. N. Wescott, the Brother of the Author of "David Harum."

(Copyright 1915.)

CHAPTER XX.
Muscular Christianity.

IT WAS eleven o'clock at night. Mrs. Betty had retired, while her husband was still struggling to finish a sermon on the importance of foreign missions. Ordinarily, the work would have been congenial and easy for him, because he was an enthusiast in the matter of missionary work; but now for some reason his thoughts were confused; his enthusiasm was lacking, and his pen dragged. He tried hard to pull himself together, but over and over again the question kept repeating itself in his tired brain: Why should the church support foreign missions, while she lets her hard-working clergy at home suffer and half starve in their old age, and even while they are working in their prime? Why should a doctor reach his highest professional value at seventy, and a parson be past the "deadline" at forty-five? Here he was, subject to the caprice and ill-will of a sour and miserly senior warden, and a cowed and at least partially "bossed" vestry—and he, the rector, with no practical power of appeal for the enforcement of his legal contract. It was only thanks to Jonathan Jackson, the junior warden, that any revenue at all reached him; for Bascom had used every grain of influence he possessed to reduce or stop Maxwell's salary. Mrs. Betty, plucky and cheery though she was, already showed the results of the weary struggle; it was not the work that took the color from her cheeks and the freshness from her face, but the worry incidental to causes which, in any other calling in life but his, would be removable.

Already he had parted with a considerable number of his books to eke out, and meet the many calls upon him—urgent and insistent calls. It became abundantly clear, as his mind strayed from the manuscript before him and turned to their immediate situation, that he was already forced to choose between two alternatives: Either he must give up, and own himself and all the better influences in the place beaten by Bascom and his satellites; or he must find some means of augmenting his means of living, without allowing his time and energy to be monopolized to the neglect of essential parish and church duties.

As he thought on these things, somehow his enthusiasm for foreign missions ebbed away, and left him desperately tired and worried. He made several abortive attempts to put some fire into his missionary plea, but it was useless; and he was about to give up when he heard Mrs. Betty's gentle voice inquiring from the next room:

"May I come in? Haven't you finished that wretched old missionary sermon yet?"

"No, dear; but why aren't you asleep?"

"I have been anxious about you. You are worn out and you need your rest. Now just let the heathen rage, and go to bed."

Maxwell made no reply, but picked up his manuscript aimlessly with his pen. Betty looked into his face, and then the whole stress of the situation pierced her; and sitting down by his side she dropped her head on his shoulder and with one arm around his neck stroked his cheek with her fingers. For a few moments neither of them spoke; and then Maxwell said quietly:

"Betty, love, I am going to work."

"But Donny, you are one of the hardest working men in this town. What do you mean?"

"Oh, I mean that I am going to find secular work, the work of a day laborer, if necessary. Matters have come to a crisis, and I simply cannot stand this sort of thing any longer. If I were alone I might get along; but I have you, sweetheart, and——"

Maxwell stopped suddenly, and the brave little woman at his side said:

"Yes, I know all about it, Donald, and I think you are fully justified in doing anything you think best."

"And you wouldn't feel ashamed of me if I handled a shovel or dug in the street?"

"I'd be the proudest woman in the town, Donny; you are just your fine dear self, whatever you do; and if you have the courage to put your pride in your pocket and work in overalls, that would make you all the finer to me. Manual work would relieve the tension of your nerves. You seem to be in fairly good physical condition. Don't you worry one bit about me. I am going to wash some lace curtains for Mrs. Roscoe-Jones, and that will keep me out of mischief. Now, if you will allow me, I am going to tear up that sermon on foreign missions, and start a little home mission of my own by sending you to bed."

The second morning after this ruthless destruction of Maxwell's eloquent plea for the mission at Bankolulu, Danny Dolan drove up to the tent-rectory at half past six, dressed in a rather soiled suit of overalls: Danny was a teamster, a good looking youth, and a devoted friend of Maxwell's since the parson had taken care of him and his family through an attack of malignant diphtheria. But while Danny was a most loyal friend, he was not of the emotional type, and so, when Maxwell had seated himself comfortably and had lighted his briar pipe, Danny started down the road at a vigorous pace, grinning broadly at Maxwell's attire as he remarked:

"So you're really goin' to work like the rest of us, I reckon."

"Right you are, Danny—four days a week, anyhow. Don't I look like the real thing?"

"Sure you do; only you better not shave every day, and you'll have to get your hands dirty before you can fool anybody, and maybe your face'll give you away then. Be you comfortable in them clothes?"

"Sure thing; I'm never so contented as I am in working clothes."

"That's all right. You're the stuff. But how about the proper old maids in the parish who ogle and dance around you; they won't cotton to your clothes a little bit. They'll think you're degradin' of yourself and disgracin' of the parish. Here you be ridin' on a stone wagon and you don't look a bit better than me, if I do say it."

"I'm afraid they'll have to survive the shock somehow or other; a man has to dress according to his work."

"Hm! Now there's that there Mrs. Roscoe-Jones and Miss Bascom; I'll bet if they saw you in that rig they'd throw a fit."

"Oh no; it isn't as bad as that, Danny."

"They'd think you'd been disgraced for life, to become a laborin' man, you bet."

"A what?"

"A laborin' man."

"Then you think that a parson doesn't labor?"

"Well, I always thought that bein' a parson was a dead easy job and a nice, clean job, too."

"Danny," Maxwell inquired after a momentary silence, "don't you suppose that a man labors with his brain as well as his muscles? And sometimes a parson labors with his heart, and that is the hardest kind of work a man ever does. The man who is most of a laboring man is the man who labors with every power and faculty he possesses."

"Well, now, I guess that may be right, if you look at it that way."

"Yes; you speak of a laboring man and you mean a man who uses his muscles and lets his brain and his feelings die of starvation. To try to help someone you're fond of, who is going to the bad, is the most nerve-racking and exhausting work any man can possibly do."

"Hh! you always was a dum queer parson, more like the rest of us, somehow. And you don't hold that you're disgracin' your profession ridin' with me, and shovelin' gravel?"

"I don't seem to be worrying much about it, do I?"

"No," he agreed—and added, "and I'm sure I would like a day off now and then from preachin' and callin' on old maids, if I was you. But there's times I might be willin' for to let you take my work for yours."

"Now see here, if you'll do my work for a few days I'll do yours."

"Well, what'd I have to do? I ain't makin' any contract without specifications."

"Well, suppose we say you do my work Saturday and Sunday. That means you finish up two sermons which must be original and interesting when you are preaching to the same set of people about a hundred and fifty times a year. Then you must go and see a woman who is always complaining and listen to her woes for three-quarters of an hour. Then you must go and see what you can do for Tom Bradshaw, who is dying of tuberculosis. Then you must conduct a choir rehearsal—not always the highest gratification of a musical ear. Sunday you must conduct four services and try to rouse a handful of people, who stare at you from the back pews, to some higher ideals of life and common decency. Then——"

"Oh, heavens, man! Sure, an' that's enough; I stick to the stone wagon every time."

"You'd be a fool if you didn't," replied Maxwell straightly. "Then again you get your pay promptly every Saturday night. I never know when I am going to get mine."

"You don't? Begad, and I wouldn't work for anybody if I wasn't paid prompt. I'd sue the Bishop or Pope or somebody."

"Parsons don't sue. It's considered improper."

"Well, well," muttered the astonished Danny. "Be you sure you can shovel stone then?" he asked.

Maxwell unbuttoned his wristband, rolled up his sleeve. "If I can't, I'll know the reason why," he remarked tersely.

"That's the stuff," laughed Danny, looking at Maxwell's muscle. "I guess I don't want to meet you out walkin' after dark without a gun. But, say, why don't you swat the Bishop one and get your pay?"

"The Bishop isn't responsible."

"Well, I'll bet I know who is, and

The Kingdom of the Subscriber

In the development of the telephone system, the subscriber is the dominant factor. His ever-growing requirements inspire invention, lead to endless scientific research, and make necessary vast improvements and extensions.

Neither brains nor money are spared to build up the telephone plant, to amplify the subscriber's power to the limit.

In the Bell System you have the most complete mechanism in the world for communication. It is animated by the broadest spirit of service, and you dominate and control it in the double capacity of the caller and the called. The telephone cannot think and talk for you, but it carries your thought where you will. It is yours to use.

Without the co-operation of the subscriber, all that has been done to perfect the system is useless and proper service cannot be given. For example, even though tens of millions were spent to build the Transcontinental Line, it is silent if the man at the other end fails to answer.

The telephone is essentially democratic; it carries the voice of the child and the grown-up with equal speed and directness. And because each subscriber is a dominant factor in the Bell System, Bell Service is the most democratic that could be provided for the American people.

It is not only the implement of the individual, but it fulfills the needs of all the people.

Who Did It?

TWENTY women were robbed at a ball of $75,000 in jewels---a taxi-driver was murdered on his car---four blocks away a woman on a bus was killed---the whole town plunged in darkness---'phone service cut off---trolley lines tied up.

And all this happened at one and the same moment! Who did it?

You're in for the thrill of your life tracking down these baffling mysteries in the most exciting story you've ever read---

"The Curve of the Catenary"

By

Mary Roberts Rinehart

(*Author of "K," "Seven Days," "The Man in Lower Ten," etc.*)

This mystery would stir the blood of a statue. It keeps you guessing and guessing. And you'll never guess right. Once you begin you won't be able to put this story aside until the amazing climax comes along. It begins in June and is completed in two generous instalments after that.

For 50c we'll enter your subscription to Pictorial Review for four months so that you will get this whole novel and in addition a complete novelette with the August issue, as well as the advance Fall Fashion Number in September. Just sign and mail the coupon with 50 cents.

PICTORIAL REVIEW

The Pictorial Review Company
216-226 West 39th Street
New York City

Gentlemen:---

I enclose 50c. Please send me Pictorial Review for four months, beginning with the June issue containing the first instalment of Mary Roberts Rinehart's new mystery serial.

I'd like to swat him one for you, the miserable old bag-of-bones."

"Never you mind, Danny; I can take care of myself."

"Sure you can, and I guess you're a laborin' man all right, even if you don't belong to the union. Why don't you get up a parson's union and go on strike? By jove! I would.

"Danny, don't you think it looks like rain?"

"No, neither do you; but here we are at the stone pile. My! but how the fellers will grin when they see a tenderfoot like you, and a parson at that, shovelin' stone. But they won't think any the less of you for it, mind you," he reassured his companion.

Maxwell knew most of the men and greeted them by name, and when he rolled up his sleeves and began work they quickly saw that he was "no slouch," and that he did not "soldier," or shirk, as many of them did—though sometimes they were inclined to rest on their shovels and chaff him good-naturedly and ask him if he had his union card with him.

Shoveling stone is no picnic, as Danny and his fellows would have put it. It is not only the hard, obstructed thrust, thrust of the shovel into the heap of broken stone, and the constant lift and swing of each shovelful into the wagon; it is the slow monotony of repetition of unvarying motion that becomes most irksome to the tyro, and wears down the nervous system of the old hand till his whole being is leveled to the insensibility of a soulless machine.

But, though new to the process itself, Maxwell was not ignorant of its effects; and soon he found himself distracting his attention from the strain of the muscular tension by fitting the action to the rhythm of some old sailor's chanteys he had learned at college. The effect amused the men; and then as some of them caught the beat, and others joined in, soon the whole gang was ringing the changes on the simple airs, and found it a rousing and cheerful diversion from the monotony of labor.

If a pause came, soon one of them would call out: "Come on, Parson, strike up the hymn."

One by one the wagons were loaded and driven to the road. After they had filled the last wagon, Danny put on his coat and he and Maxwell mounted and drove out of the yard.

"Where are we going with this?" Maxwell inquired.

"Down on the state road, first turn to the left."

"Why, that must be near Willow Bluff, Mr. Bascom's place, isn't it?"

"Right opposite. Bascom, he come out yesterday and said he wouldn't stand for that steam roller snortin' back and forth in front of his house. But Jim Ferris told him he had orders from Williamson and he wasn't goin' to be held up by nobody until Williamson told him to stop. Jim isn't any kind of fool."

When they arrived in front of Willow Bluff they stopped, dismounted and dumped the crushed stone and then returned to the stone yard. At noon they camped out on the curb in front of Willow Bluff. After Maxwell had done full justice to the contents of his dinner pail he stretched himself full length on the grass for a few moments, chatting with his mates in friendly fashion. Then he went over to the roller and assisted the engineer in "oiling up." Being a novice at the business, he managed to get his hands black with oil and smeared a streak across one cheek, which, while it helped to obscure his identity, did not add to his facial beauty. He was blissfully unconscious of this. About three o'clock Bascom returned from his office, just as Maxwell was dismounting from the wagon after bringing the load. At first glance Bascom did not recognize the rector, but a second glance brought the awful truth home to his subliminal self, and he stopped and stared at Maxwell, stricken dumb. Maxwell politely touched his hat and smilingly remarked that it was a fine day. Bascom made no reply at first.

"Can it be possible that this is you, Mr. Maxwell?" he almost whispered, at last.

"It is, to the best of my knowledge and belief."

"What in the name of heaven are you working with these men for, if I may ask?"

"To earn sufficient money to pay my grocer's bill."

Bascom colored hotly and sputtered:

"I consider it a shame and a disgrace to the parish to have our rector in filthy clothes, drawing stone with a lot of ruffians."

Maxwell colored as hotly and replied:

"These are not ruffians, sir; they are honest men, supporting their families in a perfectly legitimate way, giving their labor and"—significantly—"receiving their pay for it."

"And you, sir, are engaged to work for the parish as a minister of God."

"Unfortunately, I am not being paid by the parish; that is why I am working here. Neither my wife nor myself is going to starve."

"You haven't any pride, sir!" Bascom fumed, his temper out of control. "We have had many incompetent rectors, but this really surpasses anything. We have never had anyone like you."

Maxwell paused again in his work, and, leaning on his shovel, looked Bascom in the eye:

"By which you mean that you have never had anyone who was independent enough to grip the situation in both hands and do exactly what he thought best, independent of your dictation."

"I will not converse with you any more. You are insulting."

"As the corporation is paying me for my time I prefer work to conversation."

Bascom strode along the road towards his home. Danny Dolan, who had been a shameless auditor of this conversation, from the other side of the wagon, was beside himself with delight:

"Holy Moses! but didn't you give it to the old man. And here be all your adorers from town after comin' to tea at the house and you lookin' like the stoker of an engine with black grease half an inch thick on your cheek."

Maxwell pulled out his handkerchief and made an abortive effort to get his face clean.

"How is it now, Danny?"

"Oh, it ain't nearly as thick in any one place; it's mostly all over your face now." Then Danny laughed irreverently again. "Sure, an' you certainly do look like the real thing now."

Maxwell was raking gravel when the guests for the afternoon tea were passing; and, though he did not look up, he fully realized that they had recognized him from the buzz of talk and the turning of heads.

Danny returned from his safer distance when he saw the coast was clear. Maxwell had a shrewd suspicion that the boy had taken himself off believing it might embarrass Maxwell less if any of the ladies should speak to him.

"Did none of 'em know you, then?" he asked.

"Not one of them spoke; I guess my disguise is pretty complete."

"Thank hiven!" Danny exclaimed. "Then the crisis is passed for today at least and your reputation is saved, but if you don't get out of this they'll be comin' out again, and then nobody knows what'll happen. Better smear some more oil over the other cheek to cover the last bit of decency left in you."

At the end of the day's work Maxwell threw his shovel into Dolan's wagon and jumped up on the seat with him and drove back to town.

"Well," said Maxwell's friend, delightedly, "you done a mighty good day's work for a tenderfoot, but you done more with that old Bascom than in all the rest of the day put together My! but I thought I'd split my sides to see you puttin' him where he belonged, and you lookin' like a coal heaver. But it's a howlin' shame you didn't speak to them women, goin' all rigged up for the party. That would've been the finishin' touch."

He swayed about on his seat, laughing heartily, until they drew up before the rectory, where Mrs. Maxwell was waiting to greet Maxwell.

Danny touched his cap shyly—but Betty came down to the wagon and gave him a cheery greeting.

"Well—you've brought him back alive, Mr. Dolan, anyway."

"Yes ma'am! And I reckon he'll keep you busy puttin' the food to him, if he eats like he works; he's a glutton for work, is Mr. Maxwell."

(To be continued.)

POULTRY DEPARTMENT

THIS department is edited by a competent poultryman, who will be pleased to answer questions concerning disease, poultry management, etc., when they can be answered through the department. Questions will not, however, as a rule, be answered by mail, and stamps need not, therefore, be inclosed with inquiries. Address all letters relating to poultry topics to this office.

Letter of Experience.

To the Editor:—An experience which the writer remembers and will always remember is one which caused a great loss among chicks one spring years ago. We had a very fine bunch of Reds which we had been nursing along, after having had very successful hatches, and took pride in the fact that our birds were doing exceptionally well, growing, taking on an extra fine coat of feathers, etc., and, in fact, promising to be the season's pride. From time to time we noticed that the flocks were diminishing, until we were forced to admit that we were perplexed. We finally accidentally hit upon the solution of the affair. Chancing one day to be in time to catch Mr. Big Rat carrying off one of the large-sized cockerels into his domain under the barn, we took a tumble. Investigating, we did find the remains of our long-lost chicks. Then we got busy.

All coops were flat upon the ground. A ground floor giving plenty of opportunity for Mr. Rat and his family to take a scoot into the chick quarters. This they did with much benefit to themselves. Immediately upon finding this state of affairs we proceeded to make small horses, such as carpenters use for their work, but only a foot high. We inserted these under the coops and made small run boards two and one-half feet long, with small strips nailed across, making a runway for small chicks to climb up into the coops and made a board floor for the coop proper. This solved the matter, and from this day on we have had no further trouble. This also remedied another trouble which had been causing us considerable worry, damp and wet floors for chicks. We found the higher up floors admirably adopted and this was one of the big

Single Comb White Leghorn pullet, owned and bred by E. F. Pomplin, Fond du Lac county, Wis.

bugbears, a high and dry floor, free from rats, and the very finest coop for any weather. This system we have followed and to this date we have had no trouble at all. It is absolutely the very best we ever undertook to do.

We would advise the safe and sane method of caring for chicks in wet and inclement weather. A coop with a glass window, small blind, with a wire netting stretched across the front and made to open in hot weather to admit fresh air and sunlight, a double door, which has this advantage, when you want to care for a hen with chicks, by opening the top door you can safely care for chicks without the trouble of having them run out on you and of causing you endless trouble. It is a boon to the poultryman to procure such conveniences, which are without cost, practically, and of such a great amount of benefit that one wonders how one has been without them before. A safely guarded chick is a chick that will always grow and thrive and rear into a wonderful specimen. Chick coops are too much neglected and oftentimes made of too poorly constructed design, no light, no ventilation, no way of keeping out mites and lice. It's a "pest house" instead of a coop made to rear superb specimens.

Watertown Holstein Sale.

The Watertown Holstein Sale, held May 4th and 5th, was one of the good sales of the season. Prices ranged high and bidding was brisk most of the time. The demand for the Sunnyside Farm cattle was a tribute to the great breeder, the late S. B. Jones, who is recognized as one of the most honorable breeders and best judges of cattle in the United States. It is regrettable that this great herd could not have been kept intact by an equally square and discriminating breeder. However, they are going out and will do a great amount of good as foundation stock for other herds. The consignments of Archie Reid, Janesville, Wis.; J. E. Piper, Watertown; F. M. Ames, Brooklyn, Wis.; J. W. Goldthorpe and John Jones, of Milton Junction, Wis., Harvest Farms, Mayville, Wis., were also of special merit.

Guaranteed Seed Corn

WE recently sent average identical sample of our Northern Iowa latitude grown and Central Minnesota (Redwood Co.) grown seed corn to the foremost agricultural college of this country and have just received their official report, as follows:

CEN. MINN. (REDWOOD CO.) GROWN.

Northwestern Dent	96%	Minn. Ea. Yel. Dent	92%
Wis. No. 7 or Silver King	92%	Minnesota No. 13	88%
Minnesota King	96%	Minnesota Early White Dent	73%

THESE LOTS ARE ALL 1914 CROP

The above tests prove that our stocks of genuine NORTHERN GROWN Seed Corn are the highest qualities you can buy—regardless of price.

We Give You a Sworn Statement as to Where Our Seeds are Grown

We do not handle any dent corn from either central or southern Iowa, Nebraska, Kansas, Missouri or Illinois, as such seed, although of good germination, cannot ripen and mature in the North. Look at your map. **Don't buy seed corn that is grown south of you.**

SPECIAL NOTICE.—Until sold out and for prompt orders we offer you a varieties of our

CENTRAL MINNESOTA GROWN

Graded, shelled, high test (1914) seed corn as follows: Bushel $5.00; in 5-bushel lots $4.85 per bushel; in 10-bushel lots, $4.75 per bushel. New "American A"—bags included **free.**

We GUARANTEE every bushel of Seed Corn we ship to be exactly as represented in every particular or mo..ey refunded.

Send your order promptly if you want any of the above lots at these prices.

THE ADAMS SEED COMPANY **BOX 50** **DECORAH, IOWA**

ONEIDA COUNTY

WINNER of premiums in potatoes. I own and offer about 1900 acres cut-over hardwood lands along the Milwaukee road, including one town site, with running water, timber and water power. For sale in tracts of 40, 80, 120 acres and so on. Get my maps and price list. C. P. Crosby, Rhinelander, Wisconsin.

SILO The Northfield continuous solid steel door frames with safety ladders and 2-in. plank doors for concrete, tile, brick or block silos are the tightest, most economical, convenient and substantial silo doors made. They never stick nor get loose. Will pay you to investigate.
Northfield Iron Co., 122 **Nico Sta., Northfield, Minn.**

SILVER KING (WIS. NO. 7) SEED CORN
Ask for sample and price.
PECK BROTHERS
Spring Green **Wisconsin**

YELLOW DENT Ear tested, Golden Glow seed corn, Fire dried, 1915 crop, 95% guarantee. Price $6.00 per bushel. Money refunded if corn is tested by the Holden method and is not up to guarantee. Address Harry H. Hoard, Waupun, Wisconsin.

AGENTS—Big money selling our 15 household inventions. New, live, quick sellers. Every home buys one or more. Samples furnished active workers. Write. W. T. Carpenter Co., 5711 Harper Ave., Chicago, Illinois.

SEED CORN—Reid's Yellow Dent. Matures from 90 to 100 days; germination from 95% to 98%. J. N. Hutchinson, Dixon, Illinois.

Live Stock and Commercial Field Notes

Collected by Representatives of The Wisconsin Farmer

Another Good Duroc Herd.

IT IS always a pleasure to look over a good herd of breeding stock whether horses, cattle or swine. There is also great satisfaction in talking to men that are working for the betterment of their chosen breed and the live stock interests as a whole. Consequently when we spent a day recently with E. H. Parker & Son, of Janesviille, Wis., we met men of the above caliber and also saw one of the good herds of Durocs in the state of Wisconsin. Mr. Parker, senior, is one of the live wires of the Duroc fraternity of the state of Wisconsin. He is also one of the "wheel horses" of the Rock County Fair and at this time is putting forth all of his spare time in the interest of the baby beef contest that is to be put on at the county fair this fall. When Parker puts his 250 pounds behind a proposition one can rest assured that it is going to be a success. Now pertaining to the Durocs, as above mentioned he has one of the best herds we have seen in the state. At the present time he has almost 100 spring pigs, ranging in age from the first of March up to the middle of April. One of the best brood sows in the herd is Opal Orion by Orion Chief and she has a very fine litter of eight by Cherry King's Rival he by Cherry King by Cherry Chief. This is the best litter at this time and the man who gets a pig or two from this litter will be fortunate. The best individual sow on the place is a daughter of Marion's Wonder—at least she appeals to us most on account of her size and quality and while her litter is young they are strong and thrifty. Their sire is Defender's Gold Model. In last week's issue we called attention to the best two-year-old Duroc boar we had seen in Wisconsin, Prince Defender. This Defender Gold Model is a litter brother, being by Lee's Defender out of a Golden Model 2d dam. A daughter of the illustrious Illustrator has a fine litter by Red Advance he by Wonder Boy by Marion's Wonder. A Dominant Col. sow out of an Illustrator dam has a nice litter of eight by King Royal he by the Royal champion, Royal King. A daughter of the champion, Lee's Defender has a fine litter of nine by King Royal. Messrs, Parker will certainly have a nice lot of Durocs to offer the trade this year and they represent blood lines that are most popular. The attraction in this herd at the present time is a September boar sired by the Chief Col. by Cherry Chief dam by Pal's Col. This is one of the best boars of his age we have seen in the state and we are in hopes Mr. Parker will show him at the state fair this fall. He certainly should make a creditable showing. Don't overlook this good Duroc herd and while we didn't ask Mr. Parker if he would sell some pigs at weaning time, no doubt he would price a few. If you are interested get his prices on some of the above mentioned litters for we feel confident they will please you. Kindly mention The Wisconsin Farmer when writing. See page 26.—Adv.

John Steele's Holsteins.

THE Holstein herd of John Steele, Oconomowoc, Wis., is one of the best producing herds in the state of Wisconsin. The high production ability of the individuals in this herd has been demonstrated by the official records which have been made during the past two years. About half the animals of milking age have been put on official test and to the writer's knowledge there have been none that have not qualified. Records over twenty-eight pounds of butter in seven days have been made and a large number above twenty pounds. In a communication recently received from Mr. Steele he states, "I have not bought a female in twenty-four years. My present herd is entirely of my own breeding. The great grandam of the original females was imported by Thomas B. Wales, then secretary of the Holstein-Friesian Association. I have had two bulls from Henry Stevens & Sons, one from S. B. Jones and two from M. S. Nye." At the present time Mr. Steele is advertising six heifers for sale on page 27 in the Oconomowoc Holstein Breeders' advertisement. These were sired by Contest Colantha Crown De Kol 98171, whose dam was grand champion at the New York State Fair for two years and his sister was also grand champion at the same fair. These heifers are all straight and level and fit to stand in any show ring. For pedigrees and further information in regard to these animals write to the above address.—Adv.

Keep Stock in Condition All the Time.

IF the horses or cattle begin to go "off their feed" and to be sluggish and listless; if the cows' milk yield becomes scanty and the pigs are irritable and not laying on fat as they should, it's a sure sign that a good tonic is needed. Digestive and intestinal troubles and that all-too-prevalent pest—worms—play havoc with your stock, and unless remedial measures are taken quickly, losses are bound to ensue. Get a good, quick-acting medicine, something that combines the properties of tonic, laxative and worm destroyer, such as Dr. Hess Stock Tonic, a remedy that has been successfully employed by farmers and cattle raisers all over the country for the last twenty-four years. Dr. Hess, the compounder, is not only a doctor of veterinary science, but a doctor of medicine, so you can depend on his practical, scientific knowledge of animals and their ailments. This stock tonic, made according to his own formula, is guaranteed to bring the desired results, or the dealer will accept your empty packages and refund your money. Use it regularly and your stock will be in prime condition all the time.—Adv.

Little's Short-horns and Durocs.

IT IS always a pleasure to visit a breeder and find him doing business with the breed he handles. When a man has been in the game for a number of years and continues to enjoy a good trade it shows that he treats his customers right or he would soon be out of business. We recently looked over the Short-horns and Durocs owned by B. W. Little, Janesville, Wis. His Short-horns are strictly Bates breeding, his cows coming from Bates foundation and he has always used a Bates-bred bull. In this way he has kept his herd pure and has had excellent results. His cows are heavy milkers and they produce a uniform lot of calves and being by the good bulls, they are even better than the dams. Mr. Little's bulls and heifers are in demand as soon as they are of serviceable age. He has some fine young things coming on but has had such a demand for his bulls, that he is sold out of anything suitable for immediate service. This is a good herd to keep in mind. In Durocs we found close to a hundred pigs of spring farrow, mostly March and we have not seen a thriftier bunch this year. This herd is rich in the blood of Defiance, a Browning bred boar, sired by Defender. Some of his best sows are by this boar. The spring pigs are by Critic Top Notcher, a son of Dusty Critic 2d and out of a Top Notcher dam. Dusty Critic 2d is the sire of Critic B., the Nebraska grand champion, so it will be seen that the Little boar comes of good breeding. There are also several good litters by King Defender he by Ohio King and his dam by Defiance. This boar has great scale and is the sire of a desirable lot of Durocs. Mr. Little has already received several orders for spring pigs to be shipped at weaning time, and if you are going to want Durocs this is a good time and place to buy them. He can supply you with pairs or trios not related. Get your order in early and in writing please say you saw the advertisement in The Wisconsin Farmer. See page 26.—Adv.

Rushing Business in Hampshires.

WE have just had a letter from A. M. Laird who owns one of the best herds of Hampshires in the Northwest, located at Prairie du Chien, Wis. He writes as follows: "I've been out of sows due to farrow in May for about thirty days. One man said I had better change my advertisement, so I am sending change of copy, for I don't like to have to write so many letters and tell them that I can't fill their orders. My herd is sold down to where it looks slim. Sows bred for early June all gone and only have a few left that are bred for late june and July farrow. Have a few winter pigs ready to ship, but I can see now that I'll not be able to fill all orders this summer unless I can buy some good pigs, but as you know I can't use them unless they are good. The nicest part of my business is that I continue to get repeat orders from last year's customers and have had splendid reports from sows shipped the past winter. I credit my success to my satisfied customers. Have 101 spring pigs and I never had a bunch that are doing nicer. Drop in when in this vicinity." The fact that Mr. Laird has had such a good trade is due to the fact that he handles good Hampshires and treats his customers fair. The best recommendation a breeder can have is satisfied customers. We are glad to refer our readers to Laird's famous Hampshires when in the market for anything of this good breed of swine. His spring pigs will soon be ready to ship, singles, pairs or trios, unrelated, better order early and get the pick. Write at once and please mention this paper. See page 26.—Adv.

THREE Herefords from the herd of Birch & Thompson, Lake Geneva, Wis. Typical of the animals to be sold in their sale, May 18th. See advertisement on page 26 of this issue.

A Powerful Car at Low Price.

THE Overland is a light, economical car, but it is like the big cars in that it has abundant power. The Overland is an exception to the rule that automobile prices vary according to power—it develops thirty-five horse power with ease and sells for only $695. A tremendoes volume of business is the thing that permits the sale of this car at such a low price. The Willys-Overland Company claim to make twice as many cars as any other producer of a car of like class. Indications are for a car shortage this spring, and if you want a car, your order should go in early. Write for the beautiful Overland catalog, and investigate the merits of this car. Address, the Willys-Overland Company, Toledo, Ohio. See advertisement on page 28.—Adv.

Birch & Thompson Hereford Sale.

ATTENTION is called to the Hereford offering of Birch & Thompson at Tawasentha Farm near Williams Bay, Wis., on May 18th. Last year they held their annual sale on June 5th which was the first pure-bred Hereford auction in the state and it was quite well supported both by Wisconsin breeders and a few breeders from outside the state, principally W. T. McCray, Kentland, Ind., and J. D. Miles, Livingston, Mont. The latter purchased some of Birch & Thompson's offering at the Montana State Fair at Helena, Mont., and was so well pleased that he came out here to attend the sale and bought very liberally. The encouragement that this firm received has encouraged them to continue with their annual offering and this year upon the suggestion of Colonel Reppert and others, have selected May 18th, the day following W. T. McCray's sale at Kentland, Ind. Birch & Thompson are so desirous of getting the support of the better class of Hereford buyers, that they have consigned, this year, practically all of their desirable young Herefords with just a few of the big type of thick-meated cows that make a valuable addition to any herd. There are fifteen cows three years old and over. The ten two year olds are a uniform lot. Among these as well as the cows, are some that would make valuable show animals and most of them are bred to Maple's Lad 71st, a son of Robinson's Bonnie Brae 8th. The e are eight very nice yearling heifers that are very attractive, especially for anyone wishing to start in the pure-bred Herefords without too great an investment. The fifteen yearling bulls are a choice lot of young bulls and nearly every one is fit to head a herd of pure-bred Herefords. These, no doubt, will offer a great opportunity for anyone wishing a good Hereford bull. Three of the bulls and three of the heifers are consigned by the noted exhibitor and breeder, James Price, of Onalaska, Wis. Mr. Price's offering is extremely desirable, and, of course, Mr. Price always presents his cattle in a most desirable condition. This offering of forty-eigth head of registered Herefords together with the breeding cows of Birch & Thompson's herd will make a cattle show of exceptional worth and the readers of The Wisconsin Farmer are respectfully urged to avail themselves of this opportunity to attend this show and sale on May 18th. See advertisement on page 26.—Adv.

Hemlock Is an Ideal Wood for Rough Lumber Purposes.

THE season for building and repairing is at hand, and the farmer who is planning on a new house, barn or other building must decide on the kind of lumber which is best for his purpose. Lumber from trees grown near home will save trasportation costs and usually lasts longer than wood grown at some distant place where the climate is different. For all rough lumber purposes, you will find "Old Faithful" Hemlock just the wood you want. It is strong and durable and under ordinary conditions will last about a hundred years; it contains no pitch and, therefore, will not take fire easily; it is grown in Wisconsin and northern Michigan and is adapted to your climate. Read the advertisement on page 7 then go to your local lumber dealer and get information and prices on "Old Faithful" Hemlock. In addition, you should send for the valuable free plan book containing 192 pages of plans and illustrations of practical farm buildings made of Hemlock. You will be pleased with this book. Send for it to the Hemlock Manufacturers, Oshkosh, Wis., and please say you saw the advertisement in The Wisconsin Farmer.—Adv.

"The Car of No Regrets."

THE eight-cylinder, seven passenger King touring car is called "The Car of No Regrets," because those who have purchased this car have never found cause to complain of it. Prospective purchasers, also, will have no regret if they buy an eight-cylinder King. Especially will the farmer be pleased with this car which combines quality and power, for he has been trained to quickly recognize and appreciate these qualities in his live stock and farm machinery. The eight-cylinder King has great speed, grace and stamina, but it also has plenty of power, sturdiness and reliability in addition. Aluminum pistons are a feature of this car; they increase power, reduce strain on the crankshaft, resist carbon and economize fuel. Cantilever springs are another feature and they reach their highest efficiency as designed for this car; rough roads are made smooth with these spring and tires are kept gripped to the road. Rapid acceleration and

His Advertising in The Wisconsin Farmer Brought Inquiries and Sales.

THE WISCONSIN FARMER is making a splendid record in selling good live stock. Letters which come to us from live stock breeders of this state and the counties adjoining in other states, prove that these men are getting business direct from their advertising in these columns. Here is a recent letter which is added proof of our assertion:

Wisconsin Farmer, Madison, Wis. April 10, 1916. Gentlemen:—My advertisement in your paper has brought innumerable inquiries and some sales. It sold my senior herd bull for me quickly. So I will have to change my copy again and offer some other stuff. Enclosed please find a new advertisement to run for the next four weeks.

A. L. ROWE,
Proprietor Elm Valley Dairy Farm,
R. R. 4, Waupaca, Wisconsin.

With over 80,000 circulation, the greatest portion of which is concentrated in Wisconsin, The Wisconsin Farmer is easily the leading farm paper in the state. No other paper has ever had so large a list of Wisconsin readers and this fact is largely responsible for the splendid returns from live stock advertising. Our readers should not fail to scan carefully the live stock columns of this paper, as the offerings presented there come from the very best breeders of the state.

You can nearly always find just what you want in the way of live stock by referring to the advertising columns of The Wisconsin Farmer.

flexibility are other features and result from the remarkable performance of the King super-motor. You should have a catalog of this "Car of No Regrets." Write for it today to the King Motor Car Company, Detroit, Mich., and kindly mention this paper in your letter. See page 11.—Adv.

The J. E. Kennedy Short-horn Herd.

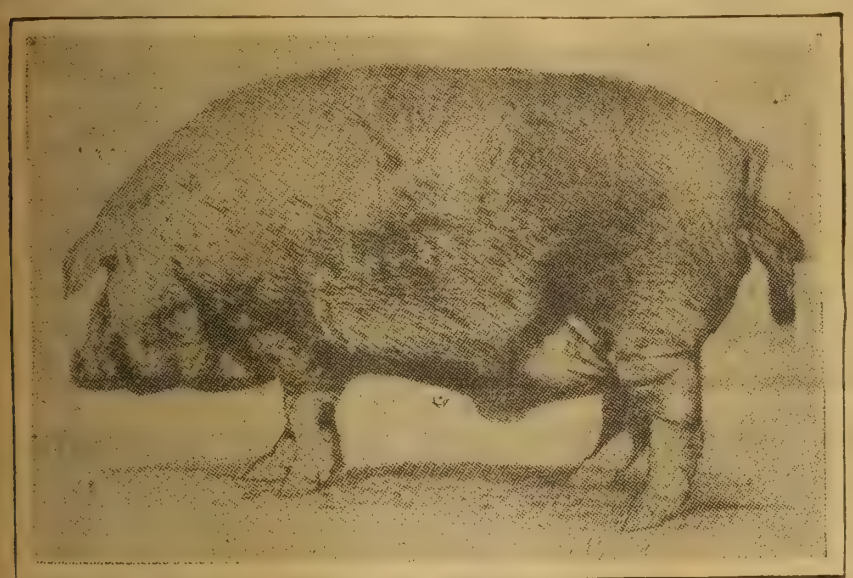
ROCK COUNTY, WIS., is noted for its good cattle of the various breeds and the leading herd of Scotch Short-horns can be seen at Oak Lawn Farm and owned by J. E. Kennedy, Janesville, Wis. We doubt if there is another Short-horn breeder in the state who has added as many richly-bred Scotch cattle to their herd within the past year as Mr. Kennedy. Some time ago he purchased a farm two miles from town, the farm was in a high state of cutlivation, but the buildings were in a dilapidated condition. New buildings of the most modern construction now grace Oak Lawn Farm. Heading the Short-horn herd is the good roan bull, Denmark 8th he by the noted Village Denmark and his dam being Barmpton Leaflet by Whitehall King by Whitehall Sultan. One need only see the calves on the place to be convinced that he is an impressive sire. Several imported cows of the best Scotch breeding are in the herd. There are also excellent daughters of the noted sire, Fair Acres Sultan carrying calves to the service of Kilgour's great Champion Goods. Violet Cup, a four-year-old daughter of Marshall Cup by Whitehall Marshall has a show calf by Champion Goods. Space will not permit the mentioning of all the good Scotch families represented in this good herd. In passing we might mention the fact that Mr. Kennedy has seven cows in the herd of the Princess Royal family and those that follow this breed closely will remember that the highest-priced bulls of the spring sales in Scotland this year were members of the Princess Royal tribe. There has been and is at the present time a growing demand for Short-horns of the milking strain, straight Scotch and Scotch-topped and inasmuch as Mr. Kennedy is getting together a herd of straight Scotch cattle he will sell a dozen heifers that have several Scotch tops in their pedigree. Most of them are sired by Strathallan King he by Whitehall King by Whitehall Sultan and they are a very uniform lot of heifers and in good condition. An attractive price is being made on this bunch of heifers and he will sell one or all. Anyone interested will buy them if they could see them. He also has one Scotch bull left that is for sale. He will be a year old in July, is roan in color and is sired by an imported bull. Here is a good buy for someone that wants a herd bull prospect. Keep this herd in mind, it will be heard from in the future, and in the meantime if you want a few heifers or a bull, write J. E. Kennedy, Janesville, Wis., and don't forget to mention this publication.—Adv.

The John L. Fisher Duroc Herd.

PROBABLY no Duroc breeder in Wisconsin has purchased more sows of fashionable breeding than John L. Fisher, Janesville. Many of the great boars of the breed are represented in this herd. The feature of the herd is the herd boar, Gold Bond. This boar has a wonderful back, great length, the best of bone and while in thin condition now, we believe that if he was properly fitted he would make a creditable showing. We have been advised that he won first in the senior yearling class at the Wisconsin State Fair last year and was in only ordinary flesh. No boar could have better breeding. Sired by Disturber he by Defender out of Lucy Wonder 112th, dam Tattletale 2d by Defender out of Tattletale by Educator by Ohio Chief. It would be hard to write a better pedigree. One of the best sows on the place is a litter mate to the grand champion, Lee's Defender. She has a good litter by Chief's Col. Fisher a son of the noted Chief's Col. A sow by the champion, Illustrator, has a litter by Chief's Col. Fisher. Two litters are by King the Col. The champion, Volunteer, has a good daughter in this herd. A Lincoln Model sow has a litter by S. & H.'s Col., a son of King the Col. There is one litter by Top Col.'s Defender by Defender. Three litters on the place by Lincoln Model. Those posted in Duroc pedigree will recognize the popular breeding in this herd. Mr. Fisher is offering some fall boars at this time sired by Top Col. Defender. Durocs are becoming popular in all parts of the world. Mr. Fisher showed us a letter written by a man in Alaska asking for prices on bred sows. Write Mr. Fisher if interested in Durocs. Kindly mention this publication. See page 26.—Adv.

A Free Book on Modern Methods of Land Clearing.

IF farming is to keep pace with other industries, it must adopt modern methods that have been proven to be of advantage to it. The uses of Atlas farm powder for blasting out stumps and boulders, digging holes for trees, and similar operations are modern, but they are no longer experiments. The Minnesota Experiment Station found that explosives "blew stumps entirely out and broke them into pieces easily handled." Similar results have been found at other experiment stations. Convenience, small cost and proven efficiency are characteristics of Atlas farm powder for farm use. Do you have idle stump land on your farm? If so, the free book, "Better Farming," has a message for you. This book, published by the Atlas Powder Co., Wilmington, Del., tells how stump land, land underlaid with hardpan, and land covered with boulders can be made productive and profitable at small cost and with little expenditure of time. See the advertisement on page 17 and write for the free book to the company named above. Use the coupon attached to the advertisement in order to receive a prompt reply.—Adv.



GOLD BOND 196177.

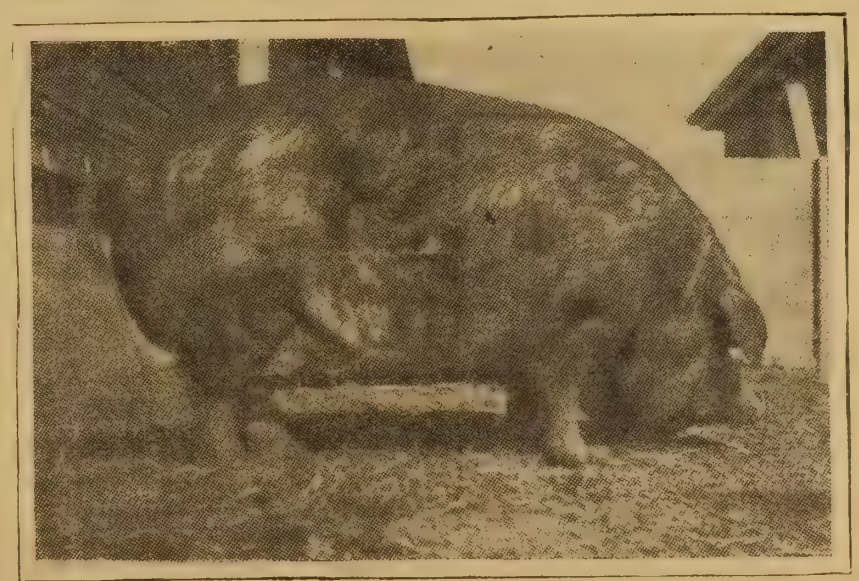
FIRST-PRIZE senior yearling Duroc boar at the Wisconsin State Fair, 1915; from a litter of fourteen; the big, prolific type. Owned by John L. Fisher, Janesville, Wis. See advertisement on page 26.

Chester White Pigs for Sale.

A FINE lot of Chester White spring pigs of February and March farrow are offered for sale by Jos. Egelhof, Edmund, Wis. These pigs are first-class stock of direct breeding from a $400 boar; no runts are in the lot. A shortage of feed makes the sale of this stock necessary. Prices are $12 each for males and $10 for females. If you want some of these pigs, see the advertisement on this page and write Mr. Egelhof. Kindly mention The Wisconsin Farmer if you write.—Adv.

Lefebures' Belgians.

H. LEFEBURE & SONS, Fairfax, Ia., write as follows, regarding their Belgians. "We have enjoyed a nice trade in our Belgian draft horses through April, but the majority of our b tter stallions remain in the barns on account of price. We now wish to announce to your readers that we have decided to make a big reduction in the price of these most valuable stallions in order to sell a few more this year. We have them in blue roans, strawberry roans, sorrels, browns and bays weighing from 2,100 to 2,400 pounds each and sound and right in every way. Anyone interested should come to Cedar Rapids and telephone us at Fairfax. Interurban service is hourly and we will meet you at any time." The advertisement appears on page 26. When writing kindly mention this paper.—Adv.



THE type of Durocs seen in the Atwater herd, Bangor, Wis. She has a fine litter by Lee's Defender. Picture taken February 28th. See the advertisement on page 26.

HARVEST EVERY MONTH.

In Some Country or Other Wheat Is Always Being Reaped.

All through the year wheat is being harvested. In January it is cut in the great fields of the Argentine and in New Zealand. In February and March it is cut in the East Indies and Egypt. The wheat fields are harvested in April in Cyprus, Asia Minor, Persia and Cuba, and in May in China and Japan.

June is the busiest harvest month of the whole year, for then Turkey, Greece, Spain and southern France, as well as most of the southern states of America are all cutting wheat.

The northerly states of America, as well as most of the southern states of Russia do their harvest-gathering in July.

August sees the wheat crop gathered in Great Britain, and September and October for Sweden and Norway. Peru and South Africa are busy harvesting in November and December.

The trees and shrubs which produce some sort of rubber are said to grow in a narrow belt round the world, within five degrees north and south of the equator.

Waukesha County Holstein Breeders' Association Third Annual Sale

Waukesha, Wisconsin, June 1

90 HEAD of the best animals in the country will be offered for sale. Fifteen of the largest breeders are consigning some of their choicest animals. These animals have all been inspected by a committee of three, one of whom is a veterinarian, to eliminate culls and inferior stock. Animals over ten months of age are tuberculin tested prior to sale by a veterinarian, under the supervision of the Ohio L. S. Sanitary Board. Each animal is guaranteed to be a breeder. No by-bidding allowed. There are cows, heifers and calves, some with 30-lb. breeding. A few choice bulls of Ormsby, Pontiac and Segis blood. The Waukesha Breeders' Association is the oldest Holstein association of its kind in the state. We have a reputation for fair dealings to maintain. We are in the business to stay. Come to the sale June 1st.

W. L. Baird, Mgr.

10 GALLOWAY BULLS FOR SALE

FROM 14 to 18 months of age, sired by Standard Favorite and Stanley's Othello. Also cows and heifers and Oxford rams. O S. Hechtner, Cheriton, Iowa.

POLAND CHINA SWINE.

Martiny's Poland China Boars

15 FALL boars of September farrow, sired by Wisconsin Jumbo, the 1st prize and Jr. champion boar at the Wisconsin State Fair, 1914. I believe he was the biggest boar of his age shown that year, he weighing 510 pounds at eleven months old. This will be the last chance to get a herd header from this great boar. The wise man will raise a few fall pigs this year if he never did before. I will sell these boars now for less than they will bring for pork after you get through using them next fall, as I wish to make room for my 100 spring pigs I already have on hand.
L. P. Martiny **Chippewa Falls, Wis.**

POLANDS

HAVE some fine fall **BOARS** to be sold at **BARGAIN PRICES** during the next month. Write. Everything guaranteed.
R. MEINKING - - BANGOR, WIS.

BLACK JUMBO

Several bulls are from Alcartra bred cows. **BONNIE MEAD STOCK FARMS, Randolph, Wis.**

Purebred Registered
HOLSTEIN CATTLE

As evidencing the enthusiasm with which members of the Holstein-Friesian Association apply themselves to the exploitation of the "Black-and White" breed, it is only necessary to state that over 4,000 certified reports of official tests were received at the Advanced Registry Office during the month of April, 1915. The Holstein-Friesian Association distributes each year $15,000 in prizes for milk and butter production. Begin with Holstein if you do nothing more than to buy a purebred bull to use on your grades. Investigate the big "Black-and-Whites."

Send for FREE Illustrated Descriptive Booklet.
The Holstein-Friesian Association of America
F. Houghton, Sec'y, Box 143, Brattleboro, Vt

No such power in any other car unless you pay nearly $200 more

As a rule automobile prices vary according to power.

The $695 Overland is the one big, important, outstanding exception to the rule.

Because we build twice as many cars as any other producer of automobiles of like class—

We can price this car way below its power class—nearly $200 below.

Another heavy shortage this spring is almost certain.

Order yours now to avoid delayed delivery.

Catalog on request—please address Dept. 112

CONTENTMENT

CURRENT EVENTS

PRESIDENT WILSON has notified the German government he accepts its assurances that its submarine warfare will be changed so as no longer to destroy merchant vessels unless there is attempted flight or resistance and without giving the crew and passengers time to get to safety, but that there is nothing in the diplomatic correspondence between the two nations making Germany's changed policy dependent upon the outcome of the proposed negotiations between the United States and England on the question of the blockade of Germany. The president has sent a final note to Germany in which he says: "In order to avoid any possible misunderstanding the government of the United States notifies the imperial government that it cannot for a moment entertain, much less discuss, a suggestion that respect by German naval authorities for the rights of citizens of the United States upon the high seas should in any way or in the slightest degree be made contingent upon the conduct of any other government affecting the rights of neutrals and noncombatants. Responsibility in such matters is single, not joint; absolute, not relative." Secretary of State Lansing summed up the situation as it exists today when he said: "So long as Germany lives up to this altered policy we can have no reason to quarrel with her on that score, though the losses resulting from the violation of American rights by German submarine commanders operating under the former policy will have to be settled."

THE short-lived and ill-fated outbreak of the Irish rebels resulted most disastrously, several hundred lives being sacrificed during the revolt and a dozen of the leaders having been executed since then as the result of court-martials. Included among those who paid the penalty with their lives was the schoolmaster who was made president of the short-lived Irish republic. Countess Markovicz, one of the prominent figures in the revolt, was sentenced to death, but this sentence was later commuted to penal servitude for life. Sir Roger Casement, who is held by many to be the real head of the revolt, is imprisoned in the Tower of London, his fate to be decided later. Sir Roger held important consular positions under Great Britain for eighteen years, but was found to have visited Germany recently and to have been a party to bringing German guns and munitions to Ireland. It is claimed that this was to aid the rebels in the revolt, although Sir Roger's friends maintain otherwise. The fact that he has held so many high positions of honor under the government makes his participation in the recent outbreak all the more notable. As a result of the revolt the member of the British cabinet in charge of Irish affairs has been forced to resign.

HOPE that at the end of the present war the nations of the world would undertake a joint effort to keep the peace, backed by a common police force, was expressed by President Wilson last week in reply to a committee of the American Union Against Militarism which called to protest against his preparedness program. The president emphatically asserted that he is "just as much opposed to militarism as any man living; I think it is a deadly thing to get into the spirit of a nation and I do not think there is the slightest danger of its getting into the spirit of this nation," but added, "only I have to determine a very practical problem." The president amplified his views by saying: "It is not inconsistent with American tradition that everybody should know how to shoot and take care of himself; on the contrary, that is distinctly implied in our bill of rights, where the right to carry arms is reserved to all of us. There is no use carrying arms if you don't know what to do with them. I should say it was not inconsistent with the traditions of the country that the people should know how to take care of themselves, but it is inconsistent with the traditions of the country that their knowledge of arms should be used by a governmental organization which would make and organize a great army subject to orders to do what a particular group of men might at the time think was best to have it do. That is the militarism of Europe where a few persons can determine what an armed nation is to do. That is what I understand militarism to be." President Wilson is known to be for preparedness as a matter of defense rather than of offense, taking middle ground between the positions held by Theodore Roosevelt and Wm. J. Bryan.

THPEE American soldiers and a ten-year-old boy, the son of a civilian, were killed in another outbreak of Mexican bandits last week. Following the successful tactics which they pursued when they raided Columbus, the bandits crossed the boundary line stealthily, taking three small settlements by surprise, and before the few soldiers scattered along the border could get their arms the bandits had wreaked their vengeance, making good their escape. This later outbreak came just when Mexican affairs seemed about to be amicably settled, inasmuch as General Obregon, minister of war under Carranza, and Gen. Hugh L. Scott, chief of staff of the United States army, had the day prior reached an agreement as to the future conduct of international affairs. This agreement was to the effect that the United States soldiers were to be withdrawn slowly, as it appeared that the Carranza forces were able to restore and to maintain order, the American troops to go no farther south than the point where they are now. This latest outbreak will probably retard the return movement of the American troops, the president and Secretary of War Baker having no intention to remove them entirely until the danger of these outbreaks is completely removed. Following this latest outbreak the president called out the national guard to Texas, New Mexico and Arizona to assist in border patrol duty.

THE senate passed without a record vote the Bankhead good roads bill to spend $85,000,000 in construction of post roads, contingent on an equal expenditure by the states. Appropriation for $10,000,000 for roads in national forests is included. The bill appropriates $5,000,000 for the year ending June 30, 1917, with increasing appropriations until 1921, when the entire amount is to have been spent. The money is to be apportioned by the secretary of agriculture, according to the terms of the bill, on a basis of one-third in the ratio of the area to which the states bear to the total area of the country, one-third in the ratio of the population and one-third in the ratio which the mileage of rural delivery routes bears to the total mileage in the country.

EUROPE'S foodstuff purchases in the United States, as shown in figures published by the bureau of foreign and domestic commerce, have fallen off sharply within the last few months compared with the enormous shipments that crossed the Atlantic in the first year of the war. Foodstuff exports in the nine months ending with March show a decline in value of $63,000,000 from the corresponding period of the year before. Shipments of meat and meat products increased, totaling within the nine months $180,000,000 against $132,000,000 the year before, but declining breadstuff exports reduced the aggregate value of food shipments from $956,000,000 to $893,000,000.

LAW QUESTIONS.

Mortgagor's Fixtures.

A Wisconsin Subscriber.—There is a mortgage upon my farm. After the mortgage was given I built a silo on the farm. Can I lawfully remove it from the place?

Answer.—If the silo is a mere temporary structure and not fixed to the premises you can remove it, but if it is fixed to the premises and of a permanent character you have no right to remove it.

Mortgagor's Right to Timber.

A Subscriber, Greenleaf, Wis.—A holds a mortgage on B's eighty acres of land, given in 1912, and due in April, 1917. A holds a second mortgage on the same land, given in 1915, and due in May, 1917. One mortgage is for $4,000 and the other is for $900. The eighty acres is worth about $7,500. There is about fifteen acres of timber on it. (1) Can A prevent B from cutting down the timber on the land? (2) If B fails to pay interest promptly on the two mortgages, can A foreclose the mortgages without giving B notice?

Answer.—(1) B has a right to cut timber on the mortgaged premises for necessary fuel or for repairs needed on the place, but for no other purposes. If he attempts to cut or remove timber for other purposes A can prevent him from doing so by an injunction from the court. (2) This depends entirely upon the terms and conditions expressed in the mortgages. You will have to examine the mortgages to determine this matter.

Cemetery—Condemnation of Land.

A Subscriber, Long Prairie, Minn.—(1) Can a landowner in Minnesota be compelled by law to sell a part of his land for cemetery purposes to a church, to be used strictly as a denominational cemetery? (2) Can a city or county condemn and take land from an owner for cemetery purposes?

Answer.—(1) He cannot and a church cannot condemn land under the law of eminent domain for cemetery purposes to be used as a strictly denominational or sectarian burial place. (2) A city or county can condemn land for such a purpose.

The Zig Zag Tag Means Tested and Guaranteed Portland Cement

Portland Cement

On every bag of Marquette Portland Cement you'll find a green tag; zig zag in shape; like this

It means tested and guaranteed

FAMILY CIRCLE TALKS
BY THE PUBLISHER

A LAST WORD ON INSURANCE

MY RECENT article setting forth the value of thrift and life insurance seems to have awakened much interest in both. Subscribers are writing to me in regard to the matter in large number, and fully a half dozen of the leading insurance companies have asked permission to reproduce the article in their literature. I had no idea, when writing the editorial, that it was destined for such wide circulation, or that it would occasion so much interest. I merely expressed my honest convictions on a subject which I consider most important in these days of high, and almost extravagant, living.

I am going to take the liberty to set forth three letters which the article occasioned, representing three different and distinct points of view: That of the insurance agent who sells the policy, that of the farmer who takes out the policy, and that of the company which writes the policy. The first letter is from Mr. L. H. Burling, assistant cashier of the Green Lake State Bank, of Green Lake, Wisconsin:

Dear Mr. Pierce:—I am writing to thank you for your splendid article entitled "Thrift and Insurance." As a banker and insurance agent, I realize the value of an article of this kind in your paper. Little talks of this kind by disinterested parties will do more to put life insuance on a higher plane than all the arguments which the men in the insurance business can advance. I hope to see more articles along this line.

The second is from a grain-belt farmer whose attention was directed to this most important matter by my article. He writes:

I never stopped to think what might become of the wife and little ones after I was gone. If I ever did think of it, it seemed to me that leaving the farm to them was as much as could be expected of me. But what of the ready cash while the estate was being settled? What of the money to pay off the mortgage I have carried on the farm most of our married life? I can see now where the good wife would be up against it if there were no insurance money to tide her over until she realized on the farm. Can you give me the name of a good, reliable company that I can write to about this?

The last letter is from a high official of the insurance company which recently paid my young friend $500 for his policy, he taking this money to wipe out the last cent of indebtedness on his little home:

If a greater number of editors would take the position you have taken, it is hard to estimate the value that would be derived by the young men of the country. When approached by the company, or its representatives, they always have the feeling that we have a pecuniary interest in any insurance effected by them. It is hard to make the young men realize the importance of buying insurance while they are young. Experience is a great teacher and we rarely mature a policy without hearing the insured state that he "wished he had started sooner, or that he had taken a larger amount."

I am going to leave this matter with you, with these letters. They need no comment from me. Here we have the young man, at the age of eighteen, just in to the large city from the country, taking out an insurance policy for $1,000 and keeping up the payments, year after year, no matter what he had to deny himself to save the amount, and now receiving $500, which he uses to pay off the last indebtedness on his little home. Here we have the agent, the policy holder, the company, all approving the idea. And over against these we have those who thoughtlessly, heedlessly let the matter of insurance slip by day by day, thinking there is no hurry, or that the agent is only considering his own commission and "it's somewhat of a 'bunk' game anyway," suddenly shuffling off this mortal coil, leaving loved ones without ready money, to shift for themselves as best they can. Which side will you line up with, my friend who reads this article? Is this not a "preparedness" in which we may all readily, heartily join?

DIVERSIFIED FARMING.

I HEARD a story the other evening which seems to me to be in line with a little talk on diversified farming I have been intending to make here for quite a while. Let me tell the story first. It was told at the last national conference on marketing and farm credits by Governor Ferguson, of Texas, to illustrate his contention that farmers in his section have heretofore been contented, as he put it, with "continually buying something from somebody else and selling nothing to anybody." He continued:

Now, to illustrate what I am talking about, I want to call your attention to the fact that when you awake in the morning it is to the alarm of a Connecticut clock. You get up and button your Chicago suspenders on to your Detroit overalls. You go out and wash your face in the morning in a Toledo washpan, with Cincinnati soap. You sit down to the table and you eat breakfast from a table made in Grand Rapids, Mich. And for your breakfast you eat Chicago meat and Tennessee flour cooked on a St. Louis stove. You go out and put a New York bridle on a Kentucky mule fed on Iowa corn, And all day you plow a farm covered with a Massachusetts mortgage with a plow made in Chattanooga, Tenn., and when your day's work is over and you go home at night you read a Bible printed in Boston, you say a prayer written in Jerusalem and you crawl under a blanket manufactured in the state of New Jersey, to be kept awake all night by a darned dog, the only home product on the farm.

This is just about the best thing of its kind I ever heard. That it is grossly exaggerated we will all admit, yet there is a point to it which is not completely lost in the exaggeration. The point is just this: The successful farmer sees to it that a great part of that which is necessary for his daily sustenance is produced on his own fields.

I am not saying that the grain-belt farmer who succeeds is going to make his own alarm clock, print his own Bible and mold his own stove. That is out of the question. But I am arguing that the farmer who confines himself to one thing in farming (even while this is the age of the specialist) is not so likely to get ahead, in the long run, as the man who has a diversity of interests; rather, a diversity of crops. Let me illustrate:

When the middle West put its main reliance upon wheat raising the interest rate on farm mortgages was high, ranging from 7 per cent to 12. When it changed to diversified farming values began to increase and interest rates to decrease. The present high interest rates in the South can be attributed to the passion for raising cotton in a like manner. When the banker or the insurance agent who places a loan finds that the farm which secures the loan produces a variety of crops he knows he is protected against much, if any, possibility of crop failure and deferred interest payments. We had good proof of this last year. Our corn crop was short throughout much of the grain belt and of poor quality, but we produced bumper hay, oats and wheat crops which made 1915 the best crop year, from a dollar and cents standpoint, we have ever enjoyed. We practiced diversified farming and found ourselves many million dollars better off at the end of the year because of this fact.

I was talking this matter over with a banker friend the other night and he made a remark which impressed me as being of much merit. It was anent the farm credit bills now pending in congress. My banker friend said: "Any rural credit legislation should make borrowers participating under its provisions qualify to a simple standard of diversification of crop raising and live stock operations." He told me that another banker had put the matter even more strikingly, in this manner: "Better and more efficient farming and a prohibition of soil robbing should be the slogan of all concerned in the handling of rural credits."

I have already told you of the progressive southern woman who specifies in her farm leases exactly how much land shall be planted to various crops, so as to insure her tenants having ready money all the year around, rather than a lump sum when the cotton is picked and be moneyless the remainder of the year. The incidents I have narrated all tend, in my opinion, to prove my point, which is just this: We must fit our crops to our fields and not plant haphazard, and we must grow those things which bring us a ready and steady income, rather than to trust all in one big venture. The agricultural prosperity of the next century depends upon this, in my opinion.

SYMPATHY FOR YOUNG WOMAN.

NO ARTICLE which I ever wrote has occasioned more interest, to judge by the large number of letters received from subscribers, than the one which appeared a couple of weeks ago under the heading, "Help Wanted." Readers will recall that it told the story of a young Wisconsin woman whose father, now seventy-eight years old, and mother have lived for the past fifty-seven years upon the farm which she fears they will have to give up because she cannot get it properly worked. I printed a portion of this young woman's heart-touching letter and my answer to her, together with the suggestion that if any of my readers could give better advice they let me know, so that we might co-operate to save the farm to its aged owner.

I long ago learned to expect many letters in response to any article I might write asking for help or sympathy or advice, but even after a lifetime in journalism I am astounded at the perfect avalanche of letters caused by this "Help Wanted" editorial of mine. It is absolutely impossible for me to answer all the letters individually. Likewise, it is not only impossible, but it would not be right for me to send the name and address of this young Wisconsin woman, as most of my correspondents ask me to do. I do not have her permission to do so, and I doubt very much if she would ever give me this permission, as she does not want her plight advertised far and wide. I printed the letter without identification so that not even her friends and neighbors would recognize the story as hers, for I do not want to humiliate or embarrass her in the least. All I want to do—and all any of us should want to do—is to aid her in her extremity so as to save the farm to her gray-haired father now in the twilight of his long and useful life.

I earnestly hope that the hundreds of sympathizing farmers who have written me in regard to this matter will understand, from this, why I cannot comply with their wishes and send them the name and address or any more detailed information.

LOAFING IN THE STABLE.

IT IS now something like a dozen years since Coates Kinney passed away. His name may not be familiar to many of my readers; yet he was the author of a poem which always affected me deeply. It was entitled, "Rain on the Roof." I can easily recall some of the lines:

Earth hath naught of tone or cadence
That can work with such a spell,
In the soul's mysterious fountain whence the tears of rapture well,
As that melody of Nature,
That subdued, subduing strain
That is played upon the shingles by the patter of the rain.

Who that has ever lain in attic or mow, as I have, listening to the musical patter of the rain, can forget the reveries which this hypnotizing sound impelled? One's mind wanders far afield at the sound of running water, whether it be the little brook which meanders over its pebbly bottom across the meadow, or the gigantic fall of Niagara. We shut our eyes and the whole world passes in review, so wonderful is the compelling force of the sound. That is why I am so immensely pleased with a little poem I found in one of the magazines this week. It is entitled "Loafin' in the Stable" and deserves, in my opinion, to rank with the Coates Kinney verses:

When the day's too wet for plowin',
And the clouds are in the sky,
You'll be apt to find me loafin'
In the stable where it's dry;
Kinda tink'rin' with the harness,
Or abright'nin' up the plows,
Or aplannin' out the stanchions
So they're handier for the cows.

Or may be I'm just aloafin'
In a lazy kind of way
In the stable loft, adreamin'
In the sweet alfalfa hay,
And the tinkle, drip and dribble
Of the raindrops runnin' down
Mossy shingles on the gable
Is a mighty soothin' soun'.

Prop myself up by the winder
So's to watch the broad expanse
Of the cornfields and the medders
Where the raindrops splash and dance;
Watch the wheat fields dip and billow
As the breezes come and go,
Jest lay back there in the shelter
Of the eaves and watch her grow.

We sometimes think of a rainy day as so much time lost in our busy life; but is there not an inspiration even from "loafin' in the stable," a chance to philosophize, to lay still bigger plans for the future? Some of the most momentous plans of my life have originated as I lay sleepless in my bed at night. Will we not all agree that others have sprung into our minds as we listened to the subdued, subduing strain "that is played upon the shingles by the patter of the rain" or the "tinkle, drip and dribble of the raindrops runnin' down mossy shingles on the gable," while we were "loafin' in the stable"?

Wanted—Wisconsin Man With a Vision.

THERE has been some talk of turning the Milwaukee County School of Agriculture into a home for the feeble-minded. Efficiency experts have given it as their opinion that this should be done. In their humble estimation it would save money now needed to transport feeble-minded patients to an institution many miles distant from Milwaukee. On account of some legal complication, the details of which are dull and uninteresting, it is now announced that it will not be possible to break up the Milwaukee county school, and for the present the school will run along as usual until the lawyers can "find a way."

Milwaukee county needs some man with a vision big enough to realize the possibilities of the Milwaukee County School of Agriculture. The present attitude of the officials of Milwaukee is something like this:

We present the Milwaukee County School of Agriculture with a $500,000 property, with grounds and equipment. It is our opinion that the whole thing will be a fizzle and as soon as this can be proved we will use the building and grounds for other purposes.

Fine chance Superintendent Sievers and his helpers have with such support. Isn't there somewhere in Milwaukee a man with a broad enough mind to comprehend what might be made out of the Milwaukee County School of Agriculture? Milwaukee has over 50,000 children in her schools. Here's an opportunity to take a few hundred of them every year, out of the cramped and crowded conditions of the city and introduce them into country life. Boys and girls who are running the streets, accomplishing little more than mental anguish for fond parents, might get a real vision of life, if some plan were arranged whereby they could study farming, dairying, sewing, cooking or some other useful occupation. Have we become so fond of books that we forget that God loves the farmer and has proved it by making an opening for so many of them?

Boards and councils and politicians waste their time and the people's money bickering about matters which are of such small importance. Why palaver so much about details? Can't the superintendent of the Milwaukee schools, or the mayor, or the president of the county board, or the women's club, or some intelligent individual work out a plan to utilize to the advantage of the youth of Milwaukee county the magnificent farm plant at Wauwatosa? Are the broad, fertile acres, the hothouses, dairy barns, etc., erected for the Milwaukee County School of Agriculture, to be overrun with the feeble-minded? This school has equipment sufficient to care for more than 1,000 pupils, and these pupils could be taught useful, healthful and manly occupations, which would take them, in many cases, out of an undesirable environment and establish them in profitable business.

The Wisconsin Farmer feels a pang of regret for the low mental status of the officials of Milwaukee if they cannot see the possibilities of this agricultural and trade school located in their dooryard. Down at Seventh and Cedar streets in Milwaukee they are calling for expert dairymen through the state employment department. They are sending across the seas for dairymen. Seven miles away there is a school which will turn out good dairymen, and it is proposed to turn it over to the feeble-minded. In Milwaukee pulpits they are pleading with fathers and mothers to take their children off the streets and see that they learn a useful occupation. And a few miles away there is an institution which will accomplish this desired end if it is given proper support.

Would it not be a good plan to have a compulsory education which affects the hands as well as the head? It should be the easiest matter in the world to find 1,000 boys and girls every year who will want to avail themselves of the agricultural and domestic science teaching at the county school. Under proper direction boys should be making a great garden out of the Wauwatosa farm. The Wisconsin Farmer believes there are 5,000 parents in Milwaukee today who would be glad to have their children in the Wauwatosa school if they understood the situation. The city could well afford to find some way to take the children to school and return them home. Work on the farm or in the kitchen could be made a part of the city school course.

In some of our cities the Rotary Club is accomplishing big things. Such an organization ought to investigate the possibilities of the Milwaukee county school. The investment has been made. It would be about as sensible to turn the First National Bank building into a livery stable as to fail to use the County School of Agriculture, with its beautiful grounds and equipment, for any other purpose than that for which they were intended. We are in favor of taking good care of the feeble-minded. It is a state duty. But if a few more of our youth were brought up in a better atmosphere and taught more useful things there would be less expense for feeble-minded.

Someone in Milwaukee city or county ought to be big enough to get behind this school, jerk it from the political caldron and start it out on a career of usefulness. The needs of the rising generation demand it.

Rock County, Wisconsin, Setting Pace For Co-operation.

THE present year will be one of extreme activity along agricultural contest lines in Rock county, and the farm boy in that county who fails to take advantage of these contests will not only overlook the opportunity to learn some of the new things in agriculture but also the opportunity to win some spending money of his own. Business men, bankers and breeders have made these contests possible for the farm boys of the county by offering the necessary prizes, and it is up to the younger farmers to take advantage of them.

Six contests are being conducted this year that are of direct interest to the boys of the county. Three of these six promote interest in live stock farming; two in corn growing and one in keeping the public roads in good condition. The Janesville fair has offered prizes to the boy who can produce the best baby beef at the smallest expense; the breeders' association has put up the money in a contest for the rearing of a calf from birth, and the breeders in co-operation with the bankers are sponsoring a pig-raising contest. Any farm boy in the county can get into all three contests, and we venture to predict that by the end of the contest he will be far wiser than he is today. The same holds true of the acre and the ten-ear corn-growing contests which were inaugurated in this county two years ago and which have proven so successful. These contests offer the opportunity to learn by actual experience how to raise live stock at the least expense; how to make an acre yield its maximum of corn and in addition to getting such valuable experience the winners receive prize money which can be used in many different ways by the boys. The experience alone is worth the effort, to say nothing of the awards, and as an additional inducement there are the state contests along the same lines.

Three other activities are being pushed in the county this spring as the result of the splendid co-operation in that county between the business men and bankers and the farmers and breeders. One is the county school ground improvement contest. Shrubbery, trees, etc., have been furnished by the commercial organizations to the rural schools entered in the contest and the schools which keep their grounds in the best condition will participate in the prize money. The Wisconsin Farmer wishes that every rural school in the state were entered in such a contest, as it might tend to beautify the hundreds of neglected school grounds. Another activity is the farm mannagement contest in which seventy-five farmers are keeping books and the other is an automobile alfalfa campaign that is to be conducted throughout the county.

These nine activities have been made possible through the co-operation between the business men and the farmers that exists in that county. The business men apparently go on the theory that nothing is too good for the farmer. They realize that what benefits the farming communities benefit the cities. Rock county is setting a pace in co-operation that will be hard for other Wisconsin counties to follow.

Get Out the Road Drag.

EVERY farmer should take enough interest in the roads that run by his farm to see that they are kept in good, passable condition. The use of the drag at this season in Wisconsin will do wonders in putting dirt roads in shape for summer travel and at the first spare moment now the farmer should be at work with the drag on the part that runs past his farm, and in turn collect his mileage from the county board.

The heavy spring rains have left many of the roads in bad condition, as they were badly cut up during the wet, muddy weather. On roads that have been properly drained and graded the drag will whip these into condition very rapidly, and on those not so well drained and graded it will do much good. We realize this is a busy time for Wisconsin farmers, but if every farm owner would look after the roads that pass his farm our dirt roads would be surprisingly good by the mere use of the drag.

Frequently the writer meets farmers on the drag that have enough personal pride in the work to donate their services. One instance occurred recently near Stoughton in Dane county when we found a farmer dragging the road by his place with a tractor and drag. This farmer was making splendid use of a tractor idle just at that particular time, and when we inquired if he was paid by the county for what he did he replied that he did it free of cost to his county in order to keep the road in good condition, as he did not like a rough, bumpy road by his farm. That is the spirit that means better roads.

Wisconsin Law Which Is Hardship on Pea Packers.

SOMETIMES in the enactment of our laws legislatures impose restrictions that are unjust and a burden upon certain classes of individuals or business. This is particularly true in Wisconsin in regard to the ten-hour working day for women, as prescribed by statute, and as it affects the pea-canning industry, the magnitude of which is called to the attention of our readers on another page of this issue of The Wisconsin Farmer. To this industry the enforcement of this law will work a hardship, and by a decision of the supreme court recently this statute will be enforced to the letter during the 1916 canning season.

For three years the industrial commission has permitted pea-canning factories to employ women for longer than ten hours as the peculiarity of the business demanded it. Peas must be packed within a few hours after they are cut. Of this the pea packers convinced the industrial commission which prescribed the conditions under which women workers could work more than ten hours. Now comes the supreme court, it holds the law valid and legal, and the result will be that the industrial commission must cease its leniency toward the pea packers and compel them to obey the law or suffer arrest and fine for each violation.

The farmers are interested in this law and this decision because they must depend upon the packers to take their peas when they are ready to be cut and ready for delivery to the viners. If cutting is delayed the quality of the peas is lowered. It is, therefore, necessary that the cannery have sufficient help at all times to take care of the farmers' product when it is ready for delivery to the cannery. Unless the cannery can do this it must refuse to accept more peas than it can handle each day, and a farmer who has cut his peas may find himself in the predicament of a load of peas on his hands and no place to dispose of them before it is too late to pack them. The canning season at its best is short, and as most of the plants are in smaller cities labor is scarce and hard to obtain. For that reason it has been found necessary under present conditions to work women more than ten hours daily. Double shifts are out of the question when it is almost impossible to secure enough labor for one shift.

This is the condition that now confronts the pea packers and the farmers who grow peas. Either the packers must import labor and cut down their output or the growers must arrange with nature to have their peas not all ripen at the same time. The Wisconsin Farmer does not disapprove the law limiting the hours of woman labor. It merely wishes to call attention to how the enforcement of some laws prove burdensome and appear unjust, especially when by arrangement satisfactory to both the women workers and the state industrial commission women during the three years of litigation over the law have been permitted to work longer than ten hours in the pea-canning plants. These matters should all be taken into consideration by our legislators so as not to enact laws that tend to curb any legitimate industry.

Selecting a Good Bull.

IT IS essential that the bull selected to head a grade herd of cows should be pure bred, but it is equally necessary that he should be a good individual. While this is a self-evident fact, it is nevertheless a matter that is frequently overlooked. A short time ago we attended a bull sale to which many inferior individuals had been consigned, but all sold at high prices. While it is true that the best bulls in the offering brought better than the medium and rather inferior individuals, the best were in reality the cheapest.

The first cost of a bull is the stumbling block in the way of a great many farmers when they start out to hunt for a sire to improve the next calf crop. Such should not be the case. The man who has a herd of twenty to thirty cows ought not to consider $50 to $100 more or less as a factor of great importance. He should first find the bull that is reasonably certain to improve his herd, and then pay the price necessary to get him, rather than to take one of doubtful value and thereby save a few dollars. A bull can be used for at least two or three years, so that first cost really becomes a matter of comparatively small importance.

The question arises as to what constitutes a good bull. What is a man to look for, and what should he avoid? In the first place select one of good scale with a decided masculine character, heavy

bone, and a bold, wide walk. He should show good fleshing qualities, have a deep chest, a full heart girth, and a large, roomy barrel, indicating great capacity for food. He should have a strongly masculine head, large, bright eyes, big nostrils, and firm muscles. Large, bright eyes indicate strong nerve power and big nostrils are the result of deep breathing and well-developed lungs. With all these things, the bull should have an easy carriage and a general thrifty appearance.

The bull should also be a good representative of the breed to which he belongs. In other words, he should show good breed type, as this is an indication of prepotency—ability to transmit the characteristics for which his breed is noted. Then comes the matter referred to under the term "quality," as shown by the fineness of hair, texture of bone, and pliableness of the skin. These things are indicative of feeding quality and general health and vigor. One is more apt to find high quality in a small animal than in one of large scale, hence care should be taken not to err in the matter of size, which we mentioned as one of the first points to look for. The bull should be broad and deep of body, rather low set, with straight top and bottom lines, and be rectangular in form.

Avoid narrow-chested, rough-shouldered, long-headed bulls. Such animals are lacking in constitution and prepotency. Similarly avoid flat ribs, a narrow back, and poorly developed loins and hips.

Much is said about the bull being the most important part of the herd, and the saying that "the bull is half the herd" is in a sense very true. However, it is true only in so far as 50 per cent of the bull's blood is reproduced in each calf. So far as the individual calf is concerned, its dam influences it just as much as its sire, and therefore it is also important to look well to the quality of the females in the herd. In other words, in building up a herd of breeding cows, heifers from none but the best cows should be retained for breeding purposes. Thus, while great care should be given to the selection of the bull, the same care and attention should also be given to the selection of females for the herd. Only through such a combination can continued improvement be effected.

Fruit Growing in Upper Wisconsin.

THE horticultural division of the College of Agriculture has called special attention to the opportunities for growing fruits in Upper Wisconsin. Settlers in the cut-over regions may enjoy the pleasures of growing fruit in season. Home orchards have been planted in many Upper Wisconsin counties with gratifying success. One of our leading Wisconsin fruit growers writes as follows concerning the opportunities for growing fruit in Upper Wisconsin:

Speaking of the chances for fruit growing in the inland area not influenced by the mild climate of Lake Superior, there are a few things to be taken into account before good results can be obtained.

Fruit trees two years old should be selected, as anything younger than that is likely to suffer frost injury. Planting should be made on the north slopes, protected where possible from severe west winds. Settlers have found that it doesn't pay to plant orchards on the lighter sandy soils, or on the low marshy spots.

In discussing the better varieties for use in the upper counties, experienced fruit growers usually recommend the following as being almost certain to survive and produce abundant fruit, with proper care. Apples—Duchess, Wealthy, Dudley, Hibernal, Patten's Greening; plums—Sapa and Opata, two of the Hansen hybrids, originated on the Dakota prairies; blackberry—Snyder; strawberry—Warfield, Dunlap; black raspberry—Gregg; red raspberry—Cuthbert; currant—Perfection.

The Dudley apple is a good, hardy, sound and attractive variety. The Hibernal, while a hardy cooking apple, is not as good for table purposes, as it lacks the flavor and color that some other well-known varieties have. Patten's Greening is a good, reliable type, making excellent pies. The Newell and Duchess of Oldenburg have also been tried with success in northern orchards.

The Compass plum, a cross between the plum and cherry, although not favored by many people, is still a reliable fruit for sauce and preserves, and beats stumps as a food product anyhow. It will thrive well on new land.

The above-named varieties of bush fruits and strawberries have been given a fair trial in northern Wisconsin, and reports indicate that they do well if given a chance under ordinary conditions.

Advice and suggestions about fruit growing in the northern areas of the state will be gladly furnished by the College of Agriculture, University of Wisconsin, or the State Horticultural Society, both located at Madison. Tests in trial orchards under varying conditions of soil and climates have furnished data by which the officials of these institutions can base their recommendations with a fair degree of certainty. Extending the fruit belt into the timber regions of the state will take many years of experiment and experience, but with patience and perseverance it will be accomplished in the same successful manner that the corn belt has been gradually worked northward.

Tractor vs. Animal Power.

JUDGING from the information which we have recently been gathering direct from farmer tractor users there is considerable difference of opinion among them in regard to the relative value of gasoline and kerosene as fuel for tractors. Some claim that kerosene develops more power per gallon than gasoline, while others hold exactly the opposite opinion. Most farmers, however, tell us that there is an advantage in having an engine that can burn both fuels equally well, thus giving them a chance to use either one or the other, depending upon prices. So far not over one farmer in a hundred with whom we are in touch has had anything but praise for the tractor for general farm work, except for cultivating corn, and some are using their tractors for that purpose with satisfactory results.

Much has been said in the past about the first cost of tractors being too high, but we find that actual users are not complaining on that score, because as a rule the engines are displacing enough horses to pay for themselves. Many of the small makes, used on small farms, have displaced from four to six horses, hence "first cost" becomes unimportant. Whether a tractor will displace enough horses to pay for itself on a given farm depends, of course, upon the nature of the farming carried on. On farms where the acreage of small grain is very large a tractor will displace more horses than where the corn acreage predominates.

Of course, not all land is adapted for tractor farming, nor are all systems of farming equally well suited for tractor power, owing to the fact that but few engines have been developed with which corn can be cultivated to advantage, but wherever the tractor can be used to advantage the question of cost resolves itself down to the consumption of fuel and lubricating oil, repairs and annual deterioration.

On the cost of repairs and rate of annual deterioration it is impossible to get reliable information because comparatively few farmers have used tractors long enough to make their figures trustworthy. This much can be said, however, that most tractor owners are confident that their engines will last as long as the average horse and that cost of repairs has not been excessive.

The cost per acre of fuel and oil for plowing, disking, drilling, and similar work is considered by most users as not higher than the cost of horse feed while the work is actually being done, while some consider it slightly higher. However, since horses have to be fed the year round, whether they work or not, the tractor has a great advantage in consuming no fuel except when actually at work. It is a well-known fact that the average farm horse works less than one-third of the actual number of work days in a year.

On this point some very definite figures have been gathered by the Minnesota Experiment Station on a large number of Minnesota farms during a period of five or six years. Accurate daily records were kept right on farms in different sections of the state of all the work done by horses. From these records it appears that in Rice and Marshall counties, where diversified farming is carried on, during the five-year period of 1908-1912, inclusive, the horses averaged 1,072 days of work of ten hours each a year, while in Norman county, where small grain farming is the rule, they averaged only 976 days of work per year. Thus considering 300 as the actual number of working days in a year, the horses averaged a little less than 3.5 hours of work per day, and the average cost of horse labor per hour on that basis was 9.25 cents per hour or 92.5 cents per full working day. These high-cost figures, and if anything they are higher today, have been a surprise to many, but they are based upon actual records—not guesswork—and can, therefore, not be disputed.

While comparatively few farmers have figures of this kind of their own, everyone realizes that the cost of keeping horses is a tremendous drain on the farm income since grain and hay have become so high in price, and that is really at the bottom of the present demand for tractor power. From these figures it can readily be seen that tractor fuel and lubricating oil are cheaper than horse feed, and that a tractor that can do a large share of the heavy work on the farm is an economical institution.

No Help For Oat Rust.

VERY effective remedies for the destruction of oat smut are in use, and there is not a community in the corn belt where men cannot be found who have repeatedly used formalin to destroy smut. The success attained in this matter has aroused interest in the rust question, and an Illinois farmer asks for information concerning ways and means that might be employed to prevent grain crops from being injured by this blight.

Unfortunately, there is no practical remedy for rust in so far as this end can be attained by the treatment of the seed grain. Rust spores, under certain conditions, inhabit the atmosphere in innumerable quantities, and these find lodgment on the leaves and stems of the growing plants under certain peculiar atmospheric conditions. Hot, muggy weather lasting only a short period of a day or two will, in many instances, cut the yield of a grain crop squarely in two.

Rust is nothing more nor less than a parasitic form of life, and when it once penetrates the tissue of small grain this means that the juices, instead of being utilized in the making of grain, are spent in sustaining the parasitic inhabitants of the leaves and stems.

While there is no practical remedy for rust in so far as the treatment of grain is concerned, many farmers lessen the loss from this source in the character of the rotations that they use and in the manner of preparing the soil. Anything that will prevent an unusually rank growth of stalk and leaf will tend to lessen the danger from rust. But, of course, nothing can be done at this season of the year, as the crop is now under way. Where there is a boundless supply of fertility this end can sometimes be attained by putting enough labor on the surface to make the seed bed exceedingly firm. Pasturing back the crop in some cases accomplishes the same end by preventing the kind of rank growth that will make it an easy prey to parasitic attack. Of course it must be remembered that too free pasturing will delay the ripening process and this must be kept in mind by those who undertake to cut down the rankness of growth by this method.

With reference to the matter of rotation in its relation to succulent growth, on certain types of soil it is sometimes necessary to take two and even three crops of corn following the plowing under of a sod before the land is used for small grain. By this practice the supply of nitrogen is cut down materially, and this always tends to lessen leaf development. Of course, in this respect, as in the case of preparing the land, nothing can be done for the crop of 1916, but reference is made to these matters in the hope that some of our readers may be benefited by these suggestions at a future time.

We have known cases where a badly rusted crop has been cut and cured for hay rather than allowed to mature as grain. When rust is likely to be real bad, better results can be obtained in this way, particularly when there is plenty of live stock to use the hay, than by allowing the grain to mature in the ordinary fashion. Badly rusted oats are always light in weight and very low in feeding qualities.

The Struggle With Perennial Weeds.

ALL weeds that are able to live on year after year without reseeding are classed as perennials. On account of their persistence they are generally looked upon as a greater menace than weeds that spring annually from seed. Chief among the pests of this class in the corn belt might be mentioned Canada thistle, quack grass, milkweed and bindweed. All these have sturdy underground stems and horizontal roots, with the result that a mere disturbing of the roots in many cases only increases growth activity. This is due to the fact that new leaves and stems spring from the lacerated parts. That is why it is useless to attack these perennials in anything like a half-hearted manner.

When it comes to their destruction one principle should be kept in mind, namely, that they cannot last longer than a few months if one can prevent the development of leaves and stems. This is the key to the whole matter, and where large areas are infested the task of destruction must be undertaken with heavy implements and these must be used at frequent intervals and with a marked degree of thoroughness. It is almost impossible to destroy these weeds and at the same time grow an intertillage crop like corn, it being a much better plan to keep the ground stirred from time to time until late in the growing season, and then undertake to produce a smother crop like cane or millet.

There are thousands of fields in every state of the central West that are so badly infested with bindweed that they should not be planted to corn at all this year. The work done up to this time in preparing the seed bed will answer an important purpose, because it has kept the weeds in check. Let it be continued for another month or six weeks and follow this up by sowing about three pecks of millet seed per acre or about 100 pounds of cane seed, and the perennial weeds will disappear in all probability from this land entirely. The theory underlying this practice is simply this, that the roots are being weakened because they cannot get nourishment from the atmosphere, and in their weakened condition they cannot withstand the opposition that they will meet during the late summer and fall from such smother crops as have been mentioned. The work of weed destruction will be very ineffective in case there has been any opportunity for the development of leaves and stems thus far, because this means that the root systems have been strengthened so that the pests are ready to put up a fight for their existence. They may in that case hold their own with a smother crop and store up a fine supply of food in the roots and, as a result, they will come on next year just as strong as ever.

There are those who believe that it is better to continue cultivation from time to time throughout the whole growing season in order to be done with these stubborn weeds for all time. Under certain conditions this plan is practicable, but it means the loss of the land for a whole year, whereas in following the suggestions made above one may accomplish the desired end and at the same time obtain a fine crop of roughage.

Hand work in fighting perennial weeds is only recommended in those cases where there are but few weeds. Their first introduction may frequently be headed off in this way because it seldom happens that a farm becomes seeded down to any special class of weeds during a single season. As a rule they work in and spread year after year until we finally are brought face to face with the realization that they will soon be our masters unless heroic methods for their eradication are carried out.

MONEY IN GROWING PEAS.

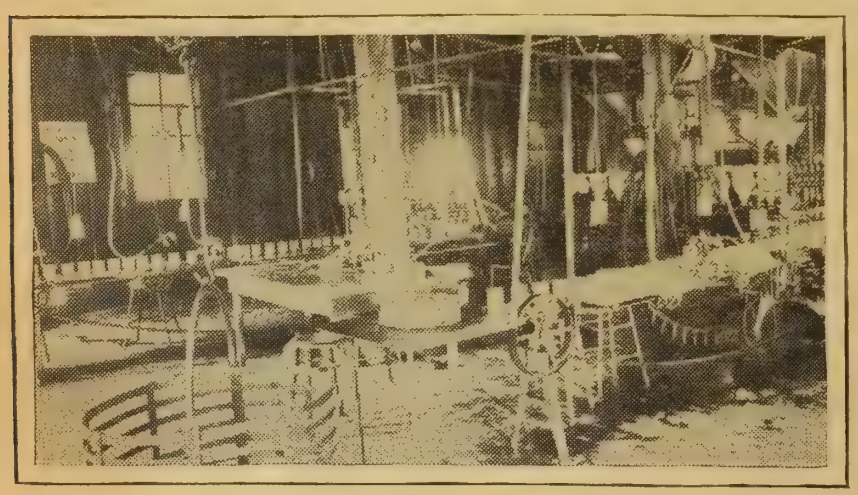
Wisconsin Farmers Find Them Profitable Cash Crop and Good Soil Builders—Thirty-seven Per Cent of Peas Canned in the United States Are Handled in the Eighty Factories in This State.

THE importance of the pea crop in Wisconsin, although it is in certain localities one of the largest farming operations, is realized by comparatively few persons. This applies not only to visitors to this state but also to residents who are not aware that 37 per cent of the peas packed in the United States last year were grown on Wisconsin farms and handled in Wisconsin canneries. With favorable conditions for peas, such as soil and climate, Wisconsin has made rapid strides in this industry since the first peas were grown for canning purposes twenty-five years ago. Farmers have found it not only a profitable cash crop but also a good soil builder, and, as most of the problems confronting the growers in the early days of the industry have been solved, the acreage is being increased each year and new factories are being built annually to care for the crop.

Twenty per cent of peas of United States canned within this circle.

It is estimated that about 90,000 acres of peas were grown in Wisconsin last year and that about $10,000,000 was paid out by the factories to the farmers and for help during the canning season. The profits per acre vary from a few cents to more than $100, but a profit of from $35 to $45 is considered good. Soil and weather conditions have much to do with the returns to the farmer and if these are right many farmers contend that peas will return them a greater profit, considering the labor involved, than any other crop.

There are now approximately eighty factories in the state canning peas and these factories have built up a splendid reputation abroad from Wisconsin peas. Last year 9,272,000 cases were packed in the United States, of which 3,430,600 were packed in this state. These factories are scattered throughout the state, but are mostly in the eastern part, along Lake Michigan. Within a radius of twenty-five miles of the northeastern corner of Dodge county are forty factories which packed 20 per cent of the peas canned in this country. These factories take the crop as it comes from the farm and the conditions under which the crop is canned are ideal and sanitary. Most of the peas are canned within five hours from the time they are taken from the field and during the process are hardly touched by the human hands.



INTERIOR OF THE NEW HOLSTEIN PLANT, SHOWING MODERN MACHINERY USED IN PACKING WISCONSIN PEAS.

Soil preparation, seed selection, drainage and rotation are important matters for the pea grower to consider. In the older sections all of these are given careful consideration, as in most instances the canneries supply the seed and supervise the work, as it is to their interest to secure a high quality crop. Rotation with other crops has been found to keep out pea blight which a few years ago caused considerable grief where peas were grown year after year on the same soil.

Drainage is especially important, as peas seem to be able to withstand any weather or climatic condition except "wet feet." This condition has led to large drainage projects in the pea districts, for it has been found that the crop is not only increased but the quality greatly improved when peas are grown on well-drained land. Where the water table on pea ground is higher than eighteen inches or two feet it is always advisable to tile for the best results.

Rotations are not necessary except as a preventive of blight, as peas are a leguminous crop and remove very little fertility from the soil. One of the popular rotations in the eastern part of the state is to follow peas by sowing rye in September followed by seeding to clover the following spring. Cut the first crop of clover for hay; plow under the second crop in the fall and return to peas the next spring. Follow this pea crop with corn, for which the ground should be manured, and follow the corn with peas again. Sometimes oats instead of rye are used. Some grow peas two years running and others have worked out different rotations, especially where factories pack corn when sweet corn is worked into the rotation.

Farmers contemplating growing peas for canning purposes should bear in mind that proximity to a factory is of the utmost importance. The grower must be near, as the grower who cannot cut and deliver two loads a day had better not undertake peas, as they must be packed the day they are cut. Of the early varieties the Alaska is mostly grown and of the late varieties the Market Garden, Advancer and Admiral are the leaders. Where the companies furnish the seed to the growers the grower receives about 2 cents a pound for his peas after they are vined. The vines are now used by most factories for feeding purposes and are run into silos during the vining process.

The seed bed should be prepared along the garden idea, as peas are nothing more than a garden plant. The right way to plow for peas is to plow about eight inches deep, or deeper if the subsoil will permit, the year previous to planting peas. This loosens up the deep soil and prepares a somewhat loose bottom for peas to root deep.

TYPICAL WISCONSIN PEA CANNERY, PLANT OF THE NEW HOLSTEIN CANNIN · COMPANY, CALUMET COUNTY.

IF THE LAND IS LUMPY IT SHOULD ALWAYS BE ROLLED.

In preparing the land for peas there should be fall plowing about six inches deep and plow your land well. Fall plowing is by far the best, especially in a dry season, as growers are not mind readers or weather prophets and the only safe thing is to figure on the possibility of getting a dry season and if by chance it is a wet season there is no harm done.

In the spring the land should have at least one double disking with disk harrow and at times land is hard and lumpy, when it needs going over twice, half lapping with pulverizer each time and follow with light smoothing harrow. This prepares land for the drill. After drilling if the land is lumpy it should be rolled, then followed with light smoothing drag to rough up the land to keep from blowing. If the land is not lumpy enough follow drill with smoothing drag. The usual way to plant peas is to use a single disk drill, known as the six-inch drill, planting about four bushels of peas to the acre. Plant the peas deep, three to four inches deep, so as to get the seed down where it will stand the dry, hot weather and do not plant peas on wet land. Allow it to dry off and mellow up before planting.

FOUR TEAMS DOUBLE DISKING FOR PEAS ON FARM OF COLUMBUS CANNING COMPANY.

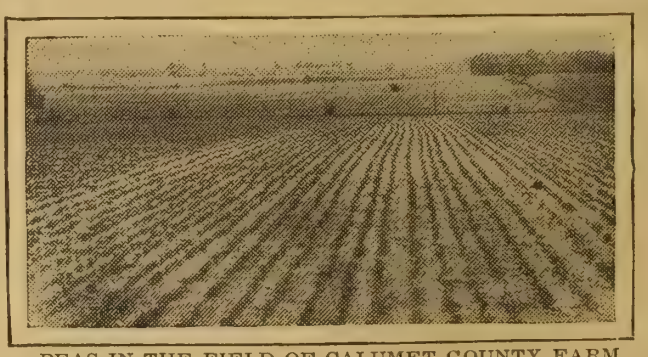
Clay loam or loose land is the best land for peas under all conditions on account of its coolness. Clay land that is apt to cake and bake is not very desirable for peas. Sand loam is, however, good pea land if planted early in the season and favorable weather conditions with frequent rains; but, as a rule, sandy soil or sandy loam is too quick to produce the best results on account of the crop ripening off too fast, which makes too many low-grade goods in the can, therefore not profitable for canning. Low, wet, cold and marshy land is not desirable land for peas.

When peas show 70 per cent of the pods with peas in them, covering all sizes, then it is high time to cut and deliver to vining machines. There is no time to be lost, as in a good many cases where other work is considered first and more essential than the peas, that being the fault in most cases, the delay shows up the inferior stock for the canner. The time to deliver peas to the vining machines is when they are at their best and not to wait for every last pod to get filled, when a good many of the older pods will shell out hard and wrinkled peas which are unfit for canning purposes.

The sizing and grading of peas is done by the packers after they are delivered by the farmers. Peas are packed in at least five sizes and three grades, as follows:

No. 1 is called Petit Pois.
No. 2 is called Extra Sifted.
No. 3 is called Sifted.
No. 4 is called Selected.
No. 5 is called June Peas.

All sizes may be purchased in the three grades, which are Fancy, Extra Standard and Standard. This is where knowledge of sizes and grades by the housewife will enable her to purchase the canned pea that she desires. Fancy peas are the best, the Extra Standard the tender and the Standard the tougher grade. A small pea does not necessarily mean a fancy, tender pea, as many housewives presume; neither does a large pea mean a tough pea. It is possible to buy a No. 2 Extra Sifted in a Standard which is the tougher grade or it is possible to buy the large No. 5 June pea in a fancy or the best grade. Sizes are marked on all labels with the brand. The grade is not marked on the label, but can be told by the price. The fancy is the higher priced in that size; the Extra Standard next and the Standard the cheaper. The state association of packers is doing splendid work to improve the quality and market for Wisconsin peas, the officers of which are. President, A. T. Hipke, New Holstein; vice president, W. H. Fromm, Thiensville; secretary, J. A. Hageman, Fort Atkinson.



PEAS IN THE FIELD OF CALUMET COUNTY FARM.

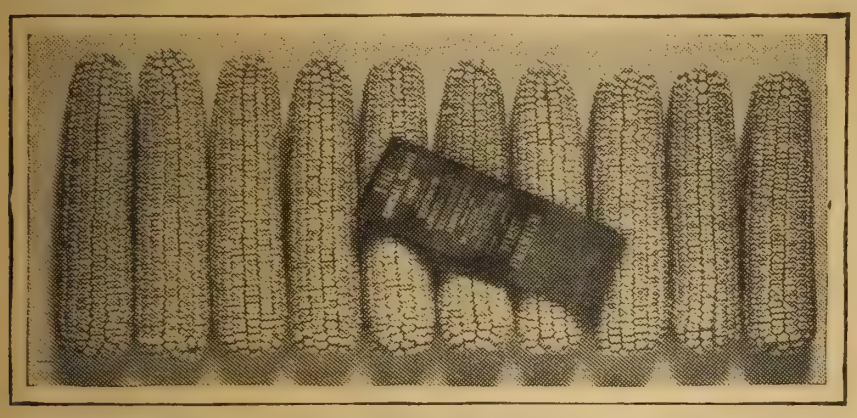
Experience in Growing Select Seed Corn.

To the Editor:—My experiment with growing pure-bred seed corn commenced in the spring of 1911. Having listened to a lecture given by Professor Moore at the college of agriculture on pure-bred seed grains, I was sufficiently interested to become a member of the Wisconsin Experiment Association. A peck of Golden Glow seed corn was sent out to each member. Having received my corn I planted it in a separate plot some distance from our other fields of corn. When the corn from this plot was harvested it was compared with our common or mixed corn. The yield and quality of the two was highly in favor of the pedigree corn. I decided to continue the experiment. The select seed from this plot was saved for the next season's planting. That same spring I also received a peck of Silver King No. 7 seed from the Wisconsin Experiment Association. The select ears of Golden Glow and the peck of Silver King were each planted in separate plots. When harvested each plot made a most satisfactory crop. A large quantity of fine seed was picked. A single ear of Golden Glow was exhibited at Madison, winning second prize. The same ear was awarded third premium at the National Grain Show held at South Carolina. It was at this time I became interested in growing corn for exhibition.



TEN-EAR SAMPLE GROWN BY MR. BRUNKER WHICH WAS AWARDED GOLD MEDAL AT PANAMA EXPOSITION.

To grow corn for show and obtain a lot of high-class seed is by no means an easy undertaking. It requires considerable hard labor and study. Without seed that has inherent tendency to produce show ears it is difficult to produce a prize-winning sample. In order to improve the type of my corn I purchased some highly bred show ears. These I planted in a small plot. When the corn was harvested a lot of select ears were obtained from which was selected a fine sample of show corn.

The method of planting and cultivation used in producing this sample, and I might say generally used in growing our corn, does not differ greatly from the method of the average corn grower. Our soil is mostly black loam with a clay subsoil. A good application of stable manure is spread on the field during the winter. This was plowed under to a depth of six inches early in the spring. The weeds are then given a chance to start. When they have started we commence disking. The harrow is then used until a fine seed bed is secured. The time of planting in the case of this plot was the 10th of May. Our corn is planted with a check row planter. I prefer this method, as it can be given the most effective cultivation. The field is generally harrowed three times after planting, once just after planting, again when the corn is just coming up. By harrowing at this time no corn is covered up. The last harrowing is done when the corn is a few inches high. We then commence cultivating. The first cultivation is deep, then shallow, until the corn is too large for the riding cultivator. The one-horse tooth cultivator is then used, going through the field after a heavy rain, the object being to remove the crust formed and prevent evaporation, also killing the weeds that have started. This is done until the corn is tasseled out.

When the corn is sufficiently matured to enable drying we pass through the field selecting the seed from the standing corn. After the seed is taken to our seed house another selection is made. Those ears that are prospects for a show sample are set aside. The seed is hung on the drying racks where artificial heat and good ventilation is applied. The ears intended for exhibition are dried under different conditions. We find that if dried slower better results are obtained for the production of show corn. When the final selection of the sample intended for exhibition is made we have a large number of carefully selected ears. One must have in mind an ideal ear, pick out one nearest to this, then proceed to find nine more like it. If you do not win out do not be discouraged, as there is glory even in defeat. J. A. Brunker.

Iowa Co., Wisconsin.

Making Ditches With Explosives

To the Editor:—There seems to be great differences in the response of different soils to the action of explosives. In going over the figures and the record pictures, of a dozen or more ditches that had been blasted out, in Maryland, Pennsylvania, Michigan, Louisiana, Mississippi, and other states, it was plain that no one rule could be laid down for all the cases.

Economical ditch blasting can be done only when the ground is wet. Yet if it is too wet experience has shown that a successful ditch cannot be made. For instance, in muck swamps in Maryland and Louisiana, where the material was semi-fluid, the explosives threw out enough material to leave a ditch, but the banks immediately moved in and closed up the cavity. Fortunately these conditions do not prevail at all over a large part of the country. Such ground is almost unknown in the North. Sandy soil offers another problem. When there is just enough water to bind the sand and what little loam and clay may be mixed with it, and not enough to make the sand soft, ditches can be blasted out very effectively and satisfactorily. You should see that the charges are placed shallow enough so that they do not tend to send their gases to useless depths in the softer subsoil. Do not try to blast ditches in dry sand, or, for that matter, in dry ground of any kind, though if you cannot wait for the wet season and you are willing to meet an increased expense, you can blast ditches through dry clay or heavy loam.

The most economical and satisfactory soils in which to blast ditches are the lighter clays, or heavy loams, such as prevail in many states. Here whenever the ground is water soaked, or even fairly moist, the results of blasting are surprisingly good. One reason probably is that the substrata of earth nearly always are solid and gas resisting. J. R. Mathern.

Will Do Work of Seven Horses.

To the Editor:—My experience with a tractor is rather short. It dates from September 10, 1915. I use a tractor which has a manufacturer's guarantee and which has twenty horse power at the belt and seven horse power on the drawbar. As our farm is only forty acres it is rather small for a tractor of this size, so I go out and do some work for my neighbors. With two fourteen-inch bottoms I have plowed seven acres in ten hours. I tried it with three bottoms, but it was too much for the engine. It would stall on a hard spot, but where the field was in good condition we plowed an acre an hour.

In working up land this spring we used a seventeen-tooth spring harrow and did more than two times the work of a three-horse team. This is because there are no stops for rest. The engine could have handled a twenty-five tooth harrow, but no more, as it would lose its traction then. I have not had any difficulty about packing the soil. The lugs as they leave the soil break it up. In plowing the drive wheel works in the furrow, working up the subsoil. On this account some farmers claim a crop increase as high as 33 1-3 per cent over horse plowing. I do not think this tractor will harm any soil unless it be used when the soil is too wet. A man who has a good tractor can afford to wait until the soil is dry enough to work because he knows he can easily make up the time. With horses he has to get at it as soon as the water is off the top of the ground or he might fail to get through in proper season.

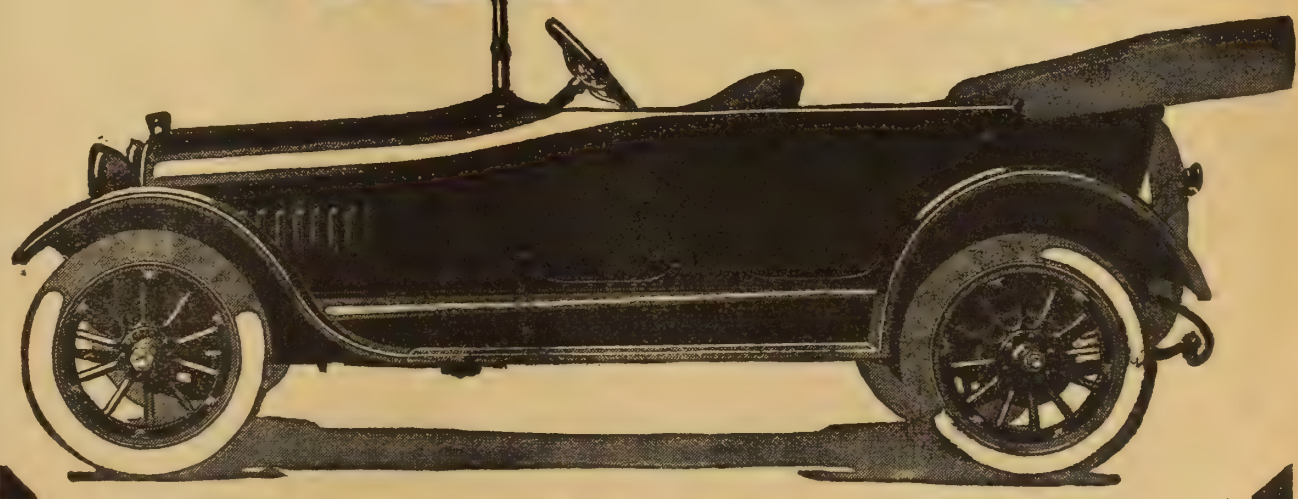
It took about two and one-fourth gallons to plow one acre and one and one-half pint lubricating oil. Gasoline is now 19 cents a gallon and lubricating oil 30 cents a gallon, so it cost about 49 cents to plow an acre. The depreciation may be put at 40 cents per acre.

One advantage is that the cost stops when the tractor stops. Of course, it has to be cleaned and adjusted from time to time, but this is a great deal less than the cost of caring for horses.

If a tractor the size of mine takes the place of two good horses it is paying for itself, but it will easily do the work of seven good horses.

Racine Co., Wis. Vitus Hloushek.

Velie Six



When You See the Velie Among the Others—

your comparisons show you the Velie Quality even more distinctly. It is alone in the light six field in the combination of *all* the high-priced features, at its low price. In this field it is unsurpassed *at any price* in Power—Finish—Upholstery—Roominess—Economy.

See it—compare—judge for yourself. The car that comes to you with all these merits backed by the responsibility of a great organization you all know. These explain why the demand has made it necessary to triple our output for many months.

Season Is Late, But Crop Conditions Are Improving

Weather Is Getting Warmer and Grass Is Growing Better---Ground Is too Wet in Some Localities---Small Grain Making Good Growth, But Part of the Acreage Not Yet Seeded.

WISCONSIN.

Buffalo County.—Cold, rainy weather has delayed spring work very much. A few farmers have finished the seeding of small grain, and some have commenced plowing for corn. Winter wheat is about one-half a crop. Clover and alfalfa completely winterkilled. Grass on the meadows is fine and promises a good yield. Cows are in thrifty condition and young calves are doing well. Pig crop is about normal. Cheese factories started April 1st.—James G. Bates.

Crawford County.—Spring is somewhat late and crops are behind. Clover meadows look good, although they winterkilled some. Timothy meadows are good, but still short. Rye is ready to shoot heads—oats and other small grain are about two inches high and growing nicely. Corn planting will begin next week on the sandy soil, but it will be about a week later on the clay soils. The pig crop is about normal—we have averaged nine pigs from each sow. Everyone is having good luck with their colts and calves.—H. H. Stukey.

Door County.—Spring is very late and not much seeding has been done. Clover winterkilled badly. Cherry trees are well covered with fruit spurs. Farmers are losing many small pigs. Good beef cattle are selling from $6 to $6.50, live weight; thin stuff at $3.50 to $4.50. —John Aznoe.

Douglas County.—Spring has been very backward. The seeding of small grains is not more than half done. Oats will be the principal crop, but more barley is being sown each year. Pastures are above the average for this time of year, and live stock are not needing any more feed. Newly seeded meadows are looking good; the excessive drifts of snow last winter served as a protection. The acreage of potatoes may be restricted because of the high price of seed. Young pigs are scarce and high; $8 a pair is asked for them. Farmers are taking more interest and care in breeding their mares and in most cases are using pure-bred stallions.—B. N. Stone.

Eau Claire County.—Small grain is nearly all seeded. Ground is in good condition to work. Some grain is coming up and looks good. Farmers are getting ready to plant corn, but none has been planted yet. About the usual acreage of corn will be planted. Not many potatoes have been planted; the acreage will be about as usual. Meadows are a little late in starting, but most of them look good, except some clover which winterkilled. Young pigs are very scarce; there are not as many brood sows as usual, and the percentage of pigs saved is below the average. The pig crop will be about half normal. Colts are as good as usual. Cattle are very scarce, because more were sold last fall than usual.—S. S. Wethern.

Fond du Lac County.—Seeding is progressing nicely. Grass is very backward and nearly all the old seeding of clover and some of the new, winterkilled. Corn planting will be very late. —A. L. Williams.

Lafayette County.—The weather has been warmer for the last week. Farmers are plowing for corn; a small amount has been planted. Small grain and pastures are growing rapidly. Pig crop is an average. Many good calves are going to market. Several buyers have been looking for grade Holsteins in this community.—W. J. Martin.

Langlade County.—Strong winds on May 8th blew down a few silos. No hard frosts have occurred lately. Ground is in good condition to work and seeding is finished in the hilly part of the country. Spring wheat is well started. Some farmers are preparing corn ground. Early potatoes are planted. The number of young pigs is not increasing. Cattle will still eat good hay. Cheese factories have been working daily for several weeks.—Chas. Parsons.

Manitowoc County.—Rains have been frequent. Seeding is late; about half of the small grain seeding is done. Winter wheat looks good. Hay crop has a good start and looks good, except the clover. Last year's clover seeding was damaged by frost or sleet.—Otto Berger.

Marquette County.—A violent sand storm on May 8th did great damage to rye, oats, young clover and garden truck. Rye and last year's clover winterkilled badly. Meadows and pastures are good. Oats are not all in on the low lands. About half the corn ground is plowed. Hay is very scarce and high, and farmers are buying feed. All kinds of live stock are in healthy condition; most lambs and calves were saved. Corn is selling at from 80 to 90 cents; oats, 50 cents; potatoes, 70 cents; beans, $3.50; bran, $26 a ton; shorts, $23; tame hay, $10 to $14; wild hay, $9.—J. M. Williams.

Oneida County.—Moisture conditions are more favorable, but weather is too cool and windy. Farmers are well along in seeding oats and other small grains. No grains are above ground, except winter rye, which is doing nicely. Plowing and dragging for corn and potatoes is under way. A few early potatoes have been planted. Pastures are hardly good enough to use, but cattle have been turned onto them. Last year's clover seeding looks fine. The loss in young pigs is small, but not many are raised here.—F. S. Campbell.

Polk County.—Season is at least two weeks late. Very little small grain was sown before May 1st and seeding is not finished yet on the poorly-drained soils. The early sown grain is coming up nicely. Clover and alfalfa came through the winter in good shape. Old meadows were damaged by the white grub last fall. Pastures promise to be earlier than usual, which is a fine thing since feed is getting scarce. Although some have had poor results, the early pig crop is about an average. Cattle are a little thin because of the poor quality of silage and corn fodder fed, and the severe winter.—P. F. Amery.

Rusk County.—Weather has turned warm and pastures and meadows are looking fine. Farmers have most of the small grain sown and some are beginning to prepare land for corn and potatoes. Most of the farmers through the organization of the potato growers' association are planting pure-bred seed potatoes. Many people are coming from Iowa and Illinois where land is $150 to $200 an acre and investing in cut-over and partly improved farms from $15 to $75 an acre. They report that grasses and conditions that make dairying a success are much farther advanced here than the localities from which they came. Milk cows are in demand and are bringing fancy prices. Many silos are being erected this season.—T. M. Thomas.

Sawyer County.—Spring has been very backward. Everything will be late; oats, wheat and corn will not be put in as early as usual. Winter rye and grasses are just commencing to leaf out. Potatoes are selling around $1 a bushel and are very scarce at that price. Farmers will plant more potatoes this year. The supply of hay has been short among stockmen, and dairy cows and cattle have been turned onto pasture sooner than usual. Success with young pigs is just fair; it would have been above normal except for the late spring and cold weather. Young dairy and beef calves have been doing well. One farmer reports wintering forty head of cattle on wild hay and a little grain; they had been pastured on cut-over land previously. Live stock in this region are free from disease, and buyers have been coming in for dairy stock. —F. O. Setter.

St. Croix County.—Seeding is all finished and the early seeding is coming up nicely. No corn has been planted, excepting some for early market. Pastures are very slow and backward. Meadows have a good, thick stand, but are slow and backward.—J. D.

Washburn County.—Season is late, but the last week of warm weather has brought the meadows and pastures forward. Not more than 50 per cent of the spring seeding is done. Some are plowing for corn. A few early potatoes have been planted. Fruit trees are budding. Live stock are still on feed.—L. D. Garnhart.

Wisconsin Crop Report.

A summary of the May crop report for the state of Wisconsin and for the United States, as compiled by the bureau of crop estimates (and transmitted through the weather bureau), United States Department of Agriculture, is as follows:

WINTER WHEAT.

State—May 1st forecast, 1,480,000 bushels; production last year (final estimate) 2,300,000; two years ago, 1,828,000; 1909-13 average, 1,591,000 bushels.

United States—May 1st forecast, 499,000,000 bushels; production last year (final estimate), 655,045,000; two years ago, 684,990,000; 1909-13 average, 441,212,000 bushels.

RYE.

State—May 1st forecast, 6,450,000 bushels; production last year (final estimate), 7,770,000; two years ago, 6,798,000 bushels.

United States—May 1st forecast, 44,300,000 bushels; production last year (final estimate), 49,190,000; two years ago, 42,779,000 bushels.

MEADOWS.

State—May 1st condition 79, compared with the ten-year average of 87.

United States—May 1st condition 88.4, compared with the ten-year average of 88.3.

PASTURE.

State—May 1st condition 76, compared with the ten-year average of 84.

United States—May 1st condition 85.2, compared with the ten-year average of 85.9.

SPRING PLOWING.

State—Per cent done to May 1, 1916, estimated 65 per cent, compared with 75 May 1st last year, and 64 the ten-year average.

United States—Per cent done to May 1, 1916, estimated 70.4 per cent, compared with 78.3 per cent on May 1st last year, and 68.6 the ten-year average.

SPRING PLANTING.

State—Per cent done to May 1, 1916, estimated 43 per cent, compared with 65 May 1st last year, and 56 the ten-year average.

United States—Per cent done to May 1, 1916, estimated 56.7 per cent, compared with 65.3 per cent on May 1st last year, and 55.9 the ten-year average.

HAY.

State—Old crop on farms May 1st, estimated 451,000 tons, compared with 580,000 a year ago and 577,000 two years ago.

United States—Old crop on farms May 1st, estimated 11,000,000 tons, compared with 8,468,000 a year ago and 7,832,000 two years ago.

PRICES.

The first price given below is the average on May 1st this year, and the second the average on May 1st last year:

State—Wheat, 107 and 134 cents per bushel. Corn, 74 and 73. Oats, 43 and 53. Potatoes, 77 and 34. Hay, $12 and $10.30 per ton. Eggs, 19 and 17 cents per dozen.

United States—Wheat, 102 and 139.6 cents per bushel. Corn, 72.3 and 77.7 cents. Oats, 42.6 and 53.4 cents. Potatoes, 94.8 and 50.5 cents. Hay, $12.20 and $11.82 per ton. Cotton, 11.5 and 9.1 cents per pound. Eggs, 18.1 and 17.1 cents per dozen.

Ways to Reduce Meat Bill.

Miss Nellie Maxwell, department of farmers' institutes of the University of Wisconsin, in a leaflet on Reducing the Meat Bill says that the high cost of living is not entirely the higher prices of foodstuffs, but the taste for luxury.

"Too many of us are like the man who said he could get along without the necessities if he could have the luxuries," she states. "The meat bill may be easily reduced in three ways —in quality, quantity or substitution of other foods. If we want the choicest cuts of meat, we must pay the choice price. We cannot hope to have fillets of beef or sweetbreads at the price of round steak or hamburger. The wise woman appreciates the value of the cheaper cuts, using the tough portions for long, slow casserole cookery in combination with vegetables of various kinds, making a small amount of meat of cheap quality season a good sized dish of vegetables. Meat on the farm may be placed in a cold place where it will keep until the whole animal is used. By smoking, corning and salting, it may be kept all summer, thus reducing the summer meat bill. Sausage, head cheese and scrapple are most satisfactory methods of using small and undesirable portions. Meat should be hung long enough to develop the flavor which increases in the hanging. The lactic acid then developed softens the connective tissue, making the meat more tender. Very tender meat, such as porterhouse steak, may be cooked quickly at first at a high temperature. The tougher portions need long, slow cooking to soften the connective tissue and the much used muscles.

Meat being the chief source of our tissue-building food, if lessened, something which will supply protein and fat must be substituted. Oatmeal with milk is a good tissue building food—the protein is formed in the oatmeal with some fat, the milk supplying more. Eggs are fully as valuable as meat in composition. When reasonable in price they are a good substitute. Cheese yields twice as much protein to the pound as meat, and if properly masticated is as easy of digestion. Among the legumes, peas, beans, lentils and peanuts are cheap and sustaining. Nuts of various kinds are rich in oils and high in protein, especially the almond. Using any of the above meat substitutes a housewife may prepare a well-balanced meal, although the use of meat occasionally is to be recommended, since the appetizing flavor of meat extractives has no substitute."

Insect Inklings.

Corn root worms yield best to crop rotation, systematic clean culture and fall plowing.

Garden web worms eat alfalfa, live and spin webs over the plant. If your field is badly infested cut the alfalfa and disk the ground.

Wire worms injure corn and potatoes most, but feed freely on wheat and oats. They thrive best in sod ground and may be controlled by crop rotation, fall plowing and good cultivation. So may the grub worms.

Grasshoppers damage field and garden crops and fruit and shade trees. Poison bran mash sowed early in the morning kills them and their eggs may be destroyed by cultivating pastures, meadows and waste lands late in the fall.

Corn root lice suck the juices from the roots of corn, grasses and weeds. They depend on colonies of small brown ants for protection and transportation and may be controlled by crop rotation, fall plowing and early spring cultivation to destroy weeds and grasses.

The army worm which eats the leaves of field and garden crops may be trapped in dusty ditches or killed with poison bran mash sowed broadcast late in the evening. Badly infested meadows should be cut at once to save much of the hay as possible.

Hessian fly grubs feed between the leaf sheath and the stalk at the crown and lower joints of the plant. Destroy the "flax seeds" which produce next year's crop by disking and plowing stubble as soon after harvesting as possible. Keep down all volunteer wheat, sow late in the fall and get your neighbors to do the same.

The chinch bug sucks the juices of corn, wheat, sorghums and other plants of the grass family. They may be trapped in dusty ditches if they go from wheat to corn or in rainy weather an oil or tar barrier may be necessary. If they get to the corn spray it with soapsuds, emulsion or tobacco solutions. The clump-forming grasses by roadsides and in waste lands may be burned in late fall and early winter to kill chinch bugs which collect there for the winter.

The poison bran mash recommended by the colleges of agriculture for the control of many insect pests is made of half a pound of powdered lead arsenate or half a pound of Paris green mixed with ten pounds of wheat bran. Add two gallons of water into which the pulp of two oranges or two lemons has been mixed together with a quart of molasses or sirup. This amount of poison bait is sufficient for sowing broadcast on two or three acres of the field to be protected. The proper use of this mixture in cutworm time should save about half of the replanting each year.

Walworth county is considering the matter of bonding to the extent of $600,000 for better roads. A county good roads organization is being effected. Under the new plan practically every section of the county will be connected with a concrete roadway. The plan is similar to that which is being worked out in Outagamie county, Wisconsin.

90 DAY HOT WEATHER OFFER
Combination Pumping Outfit $44.95

Save time—save money—save strength! Don't toil and sweat this hot weather pumping by hand. Don't depend on a windmill! Let this Galloway outfit keep your stock always supplied with fresh water. It's simple and easy to set up, and anyone can operate it. Outfit consists of 2 1-4 H. P. engine, heavy double geared pump-jack with tight and loose pulley and 16 ft. of belt.

WATER COOLED - WONT HEAT - WONT FREEZE

Will run all day in any weather. Economical on fuel. Can be used for running churn, washer, separators, saws, feed grinders and other job work.

Special 90-day price of complete outfit only $44.95. Regular price $47.19. Buy now and save $2.24 over our regular price and $10 to $45 over prices of other outfits. Installment price $52.50. Installment orders shipped on receipt of $5.25; balance $5.25 monthly.

SPECIFICATIONS
ENGINE SPEED 450 rev. per min. BORE 4 1-8 in. STROKE 5 in. DRIVE PULLEY 6 in. diameter, 4 in. face. Floor space 26x28 in. Wt. 525 lbs. Add $6 for engine mounted on trucks; $7 for Webster Oscillating magneto.

This Low Cash Price For 90 Days Only--Order Today--We Take All Risk
Order this outfit today and try it 30 days. We return your money and pay freight both ways if not satisfied. Quick shipments. Don't bother to write. Just clip this ad. and pin it to your check or money order and mail to us.
5 Year Guarantee

30 Day Free Trial

The Wm. Galloway Co.
35 Galloway Station
Waterloo, Iowa.

Dates for Wisconsin County Fairs

No Let-up in Interest in the Smaller Expositions This Year---All Anticipate Big Season.

WITH the prosperity of Wisconsin at high tide the secretaries of the hundred or more county and district fairs anticipate that 1916 will be the record season and that many previous attendance figures will be broken this year.

The fair season in Wisconsin opens in full swing in August and continues until early in October. Of the dates thus far reported the Sparta fair is first and will inaugurate the season. The fairs which have reported their dates follow. The first name is that of the fair, the second that of the secretary; the location of the fair precedes the date. Where no date is given the fair has not yet reported. The dates, etc., follow:

Adams County Agricultural Society—G. W. Bingham, Friendship; September 19-22.
Ashland County Agricultural Society—Otto D. Premo, Ashland; September 20-22.
Athens Advancement and Agricultural Association—F. H. Eisold, Athens; September 15-16.
Baraboo Valley Agricultural Society—W. H. Hahn, Reedsburg; August 1-4.
Barron County Agricultural Society—J. G. Rude, Rice Lake; September 12-15.
Bayfield County Fair Association—E. F. Daniels, Iron River; September 26-28.
Blakes Prairie Agricultural Society—Oscar Knapp, Bloomington; August 16-18.
Boscobel Agricultural and Driving Park Association—J. T. Ruka, Boscobel; August 9-11.
Brown County Agricultural and Fair Association—Herb J. Smith, De Pere, August 28-31.
Buffalo County Agricultural Society—J. W. Luetscher, Mondovi, October 3-6.
Burnett County Agricultural Society—Grantsburg.
Calumet County Agricultural Society—Chilton.
Central Wisconsin State Fair Association—R. R. Williams, Marshfield; August 29-September 1.
Central Agricultural and Driving Park Association—E. G. Briggs, Gays Mills; October 9-12.
Columbia County Agricultural Society—F. A. Rhyme, Portage; September 14-17.
Clark County Agricultural Society—Myron E. Wilding, Neillsville; August 30-September 1.
Dane County Agricultural Society—M. M. Parkinson, Madison; August 29-September 1.
Dodge County Fair Association—C. W. Harvey, Beaver Dam; September 25-29.
Door County Agricultural Society, A. C. Greaves, Sturgeon Bay; September 19-22.
Douglas County Fair Association—I. P. Lord, Superior; September 12-15.
Dunn County Agricultural Society—Menomonie.
East Monroe County Agricultural Society—F. J. Rehberg, Tunnell City (fair held at Tomah); August 15-18.
Eau Claire County Agricultural Society—Augusta.
Elroy Fair Association—D. F. Conway, Elroy; September 12-14.
Evansville, Rock County Agricultural Society—F. W. Gillman, Evansville; August 16-19.
Fond du Lac County Agricultural Society, E. R. Zamzow, Fond du Lac; September 19-22.
Forest County Agricultural Society—Crandon.
Fox River Fair and Driving Association—John M. Balliet, Appleton; September 5-8.
Glenwood Inter County Fair Association—Glenwood City.
Grant County Agricultural Society—L. A. Clark, Lancaster; September 5-8.
Green County Agricultural Society—Leland C. White, Monroe; September 5-9.
Green Lake County Agricultural Society—C. W. Hitchcock, Berlin; September 12-15.
Inter County Fair—J. E. Barnard, Spring Green; August 22-25.
Inter County Fair—Frank S. Grubb, Stanley; September 12-15.
Inter-Township Fair Association—A. J. Peterson, Oconto Falls; September 19-21.
Jackson County Agricultural Society—James Dimmick, Black River Falls; September 26-29.
Janesville Park Association—Harry O. Nowlan, Janesville; August 8-11.
Jefferson County and Rock River Valley Agricultural Society—R. B. Helen, Jefferson; August 29-September 1.
Juneau County Agricultural Society—Mauston.
Kickapoo Valley Agricultural and Driving Park Association—W. B. Van Vinter, Viola; October 4-6.
Kilbourn Inter-County Fair Association—W. B. Gillespie, Kilbourn; September 26-29.
La Crosse Interstate Fair Association—C. S. Van Auken, La Crosse; September 26-29.
Lafayette County Agricultural Society—Thos. Kirwan, Darlington; August 22-25.
Langlade County Agricultural Association—Antigo.
Lincoln County Agricultural Association—A. H. Smith, Merrill; September 20-22.
Lodi Union Agricultural Society—W. T. Richards, Lodi, September 5-8.
Manitowoc County Fair, F. C. Boerdt, Jr., Manitowoc; August 29-31.
Marathon County Agricultural Society, J. D. Christie, Schofield (fair held at Wausau); September 5-8.
Marquette County Agricultural Society—W. P. Fuller, Jr., Westfield; September 6-8.
New Richmond Fair Association—New Richmond.
North Wisconsin State Fair Association—C. E. Johnson, Chippewa Falls; September 18-22.
Oconto County Fair Association—J. B. Chase, Oconto; September 5-8.
Oneida County Agricultural Society—Arthur Taylor, Rhinelander, September 5-7.
Outagamie County Agricultural Society—Hortonville.
Ozaukee County Agricultural Society—A. W. Horn, Cedarburg; Octtober 5-7.
Pepin County Agricultural Society—Henry Pattison, Durand; September 6-8.
Pierce County Agricultural Society, Oscar Halls, Ellsworth.
Platteville Fair and Agricultural Society—C. H. Gribble, Platteville; August 29-September 1.
Polk County Fair Society—St. Croix Falls.
Portage County Agricultural Society—John Kremer, Amherst.
Price County Agricultural Society—Phillips.
Richland County Agricultural Society—W. F. J. Fogo, Richland Center; September 26-29.
Rusk County Agricultural Society—V. V. Miller, Ladysmith; September 26-29.
Sauk County Agricultural Society—S. A. Pelton, Baraboo; September 19-22.
Sawyer County Agricultural and Fair Association—J. A. Ballard, Hayward; September 26-28.
Seymour Fair and Driving Park Association—G. F. Fielder, Seymour; September 14-16.
Shawano County Agricultural Society—Shawano.
Sheboygan County Agricultural Society—Otto Gaffron, Plymouth; September 6-9.
Southwestern Wisconsin Fair Association—W. J. Penhallegan, Mineral Point; August 15-18.
Sparta Driving and Agricultural Association—Sid N. Smith, Sparta; July 25-28.
Stevens Point Fair Association—J. M. Pfiffney, Stevens Point; September 12-15.
Taylor County Mechanical and Agricultural Society—Medford.
Trempealeau County Agricultural Society—Ben W. Davis, Galesville; August 22-24.
Vernon County Agricultural Society—F. W. Alexander, Viroqua; September 13-16.
Walworth County Agricultural Society—Samuel Mitchell, Elkhorn; September 19-22.
Washburn County Agricultural Association—Spooner.
Washington County Agricultural Society—Jos. F. Huber, West Bend; October 2-4.
Watertown Inter-County Fair—C. W. Harte, Watertown; September 5-8.
Waushara County Agricultural Society—Chas. T. Taylor, Wautoma; September 27-29.
Waupaca County Agricultural Society—A. J. Rieck, Weyauwega; September 5-8.
Winnebago County Agricultural Society, Fred Badger, Oshkosh; September 19-22.
Wisconsin State Fair, Oliver E. Remey, Madison* (fair held at Milwaukee); September 11-16.

*From June 1st to September 20th, State Fair Park, West Allis, Wis.

Spring Work in Garden and Orchard.

To the Editor:—Too much rain makes the grass grow, but hinders the garden and field work. We have just had thirty-six hours' steady rain, probably two inches. I have no jar out. By putting a two-quart jar out in the open anyone can keep tag of the rainfall. An inch is a thousand barrels to the acre, so you see it is impossible to water a garden without proper facilities prepared beforehand.

Your early garden seed should have been planted the first week in April, while the ground was in working order. Strawberry plants should have been set then, or the last week in April. Much of the time since the 10th of April it has been too wet to properly work the ground unless it was sandy. If the ground is plowed or spaded when too wet it makes it so lumpy it will not get over it all summer.

One strawberry plant set in April in Wisconsin or the first week in May is worth a dozen set in June or twenty-five set in August. Summer planting, unless with potted plants or taken with a full spade of earth from a near-by bed, is never as satisfactory as early spring planting. Then one plant will make from twenty to fifty plants. Of course, we don't want such an increase except for plants. For big fruit it is best to keep the plants in hills, not allowing any runners. The next best plan for extra nice fruit is to let four plants form around each parent plant and keep off all other runners.

Now about grafting, top work; I have just grafted over 300 plum trees, seedlings in the nursery, four feet high, putting in three kinds of the De Soto new choice kinds. If your scions can be kept dormant and in good condition you can graft successfully until the 10th of June. The success in grafting is getting the inner bark of the scion and stock together and properly waxing. Grafting wax is frequently kept on sale by druggists or seedsmen. It is made of two parts tallow, four of beeswax and eight of rosin, melted, turned into cold water and worked as you would candy. Then the rolls can be laid away in oiled paper and kept for years. To use the wax from this roll, if the weather is cool, keep it in warm water; if hot, keep it in cold water, using a little tallow on your fingers. If much grafting is to be done it is better to have a little furnace like a tinner's furnace, so that the wax can be kept warm—not hot. Use a swab, taking care that every crack is covered, and, while the wax is still warm wrap the graft in old cotton cloth. This protects from the hot sun and keeps everything in good shape. Perhaps the lower bud of the scion may need looking after to open up the cover. Be sure that sprouts do not rob the scions or that they do not grow too fast. If they do, pinch them. About three buds to the scion is better than more. The most satisfactory size of limb to graft is the size of your thumb. Cut it as a boy makes a whistle, split it and insert one scion. If larger, split it with a chisel or grafting knife and insert two scions. The next spring cut off one of them. Never use a limb larger than a hoe handle.

As soon as the ground will do to work keep the cultivator running without any let-up. A garden rake is one of the best tools you can use in a garden. Keep the surface of the soil loose at all times. This will hold the moisture in the soil. The finer the teeth of the cultivator the better and run it shallow; don't turn up the moist soil and don't get too deep near the roots. Keep a dust mulch in the garden and cornfields. Geo. J. Kellogg.

Rock Co., Wisconsin.

Another Short-horn Volume.

Volume 87 of the American Shorthorn herd book is now ready for distribution. It contains 20,000 pedigrees, of which 8,000 are bulls numbered from 421,001 to 429,000, and 12,000 are cows numbered from 193,001 to 205,000. This volume sells to nonmembers for $2, charges prepaid, and those who are interested are requested to write American Short-horn Breeders' Association, 13 Dexter Park Ave., Chicago, Ill.

START THE NEW CISTERN AND BARN FLOOR NOW

Now is the time to begin your concrete construction work. Concrete feed floors, silos, cellar floors, watering troughs, etc., last forever if you take care in selecting the right cement, sand and concrete.

Medusa Cement products—Medusa Gray Portland Cement, Medusa White Portland Cement and Medusa Waterproofing give the right result in all kinds of concrete construction work.

Medusa Waterproofing

In powder or paste form. Keeps the water and dampness out of concrete—also prevents cracking and discoloration. Only eight pounds required for every barrel of cement used in the mix.

Medusa Waterproofing is a necessity in all farm concrete work—a silo or a cistern that is not waterproof is soon useless.

For all sorts of facings use *Medusa White*—the first true white Portland cement ever manufactured. It is the material to use when *appearance* and *permanence* are important considerations.

The Ready-Waterproofed Cement

We also manufacture Medusa Portland Cement (gray or white) already mixed with the *right proportions* of *Medusa Waterproofing* for every job.

Ask the Medusa dealer in your neighborhood.

In and Around Wisconsin

New Condensery at Oconomowoc Opens and One Will Be Established Soon at Neillsville—Other Items of State Interest.

A. Schultz, residing in the hemp district on the Fox Lake road near Waupun, Wisconsin, recently marketed seven loads of hemp. The total weight was 23,062 pounds, making a little over a carload and netting the grower $2,300.

County Agent Klinka, of Polk county, Wisconsin, recently contracted for fifteen tons of lime, to be distributed among the farmers in the vicinity of Dresser Junction. A similar deal has been put through by the farmers near Roberts, Wisconsin.

The annual convention of the Rural Letter Carriers' Association of Wisconsin will be held at Eau Claire on May 30th. Adolph S. Erickson is in charge of the local arrangements at Eau Claire and he promises the visiting R. F. D. boys a splendid convention. The program will be announced soon.

Mr. George T. Vorland, banker of Colfax, Wisconsin, took a company of potato growers to the recent Chippewa county growers' meeting. Mr. Vorland paid the expenses of the party. He has shown great interest in the farmers of his neighborhood and has been a great booster for the Wisconsin Potato Growers' Association.

The last shares of the $250,000 needed to establish a farmers' packing plant in New Richmond Wisconsin, was subscribed last week. The first share was sold April 5, 1915. It took just a little over a year to round up the stock promotion work. The Wausau plant began business January 10th last, and the first quarterly report, it is said, shows a 6 per cent earning on the investment.

Potato growers of Chippewa county met recently in the Cote House. They were entertained at a banquet by the Progressive Club, of Chippewa Falls. Arrangements have been made to distribute good seed this year through the Northern Wisconsin State Fair officials. School children will be urged to enter potato-growing contests on much the same basis that they have been interested in corn-growing contests.

The gasoline engine is a prominent factor in farm work on the Upland Farm, Walworth county. One engine is used to pump water; another drives the dynamo which supplies the farm with electric lights; still another engine is used for the milking machine. In addition there is a large portable engine which is moved about the farm for general work. This farm has a sixty horse power tractor which handles most of the plowing. The owner, Mr. Travis, is well pleased with the service given by his gasoline engines.

Wisconsin people are interested in another national organization designed to give relief to the farmer. This new association has the high-sounding name, National Agricultural Organization Society. The farmer's economic ailments, although more or less vaguely defined, are to be ironed out by the new organization. Frank L. McVey, Gifford Pinchot, our own Charles McCarthy and others are interested in the new organization. As an evidence of the power of the American farmers when properly organized, leaders of the N. A. O. S. point to the recent milk war in Chicago.

The Carnation Milk Products Company has opened its new condensery at Oconomowoc. Thus Carnation Milk is to become a strictly Wisconsin product. The machinery of the plant was put into operation last week. The new plant is 196x246 feet with a capacity, when it is completed, of 300,000 pounds of milk daily. The cost of the new plant will be approximately $250,000. C. A. Allweg, formerly of Richland Center, Wisconsin, is the new superintendent. At the present time there is nowhere near enough milk offered to keep the plant busy. There is a probability, however, that some of the smaller creameries near Oconomowoc will either close down or be bought up by the Carnation people and their factory people given employment in the condensery. The Carnation people own their own farm near Oconomowoc and they are developing some good Holsteins on the farm.

The contract for the new farmers' packing plant at Madison has been let and construction work begun. It is expected to have it in operation this fall. The cost, completed, will be about $225,000.

Dairymen of Dunn county, Wisconsin, have arranged for their annual picnic June 10th. The picnic will be held on the D. C. Coolidge farm near Downing. A general invitation has been extended to all dairymen.

The Dodge County Fair Association has raised the gate admission fee to 50 cents. This is one of the last of the big fairs to come to the higher rate. A number of the smaller fairs in Wisconsin started the 50-cent gate last fall.

The New Richmond, Wisconsin, Cheese and Dairy Company is handling 5,200 pounds of milk daily. This is an increase of about 2,000 pounds over last year. The company is making a number of improvements this spring in its building and equipment.

Several banks in Rusk county have arranged to supply the necessary funds to purchase certified potato seed to be distributed in one peck lots to rural school children who will grow potatoes under direction of County Representative Householder. The county fair association offers prizes.

Lewis J. Smith has resigned as official tester of the Dunn County, Wisconsin, Cow-Testing Association No. 1. Walter Rasmussen, of Hammond, Wisconsin, an official tester for the state, will hold the position temporarily. Mr. Smith goes to the P. C. Wilson Grassland Stock Farm, where he has a fine position.

A movement is under way for consolidated schools in Dunn county, Wisconsin. The plan will be tried out at Elk Mound unless the voters turn down a proposition which will be presented to them soon. Elk Mound is already supporting four school wagons reaching out in each direction for rural scholars.

THE WAY THEY SHIP HOGS FROM SOUTHWESTERN WISCONSIN. (DOBSON & EASTMAN, LANCASTER, WIS.)

Bayfield county is the latest Wisconsin county to call for a county agricultural representative. This action was taken by the county board recently when it made the necessary appropriation to pay the county's share of the cost. As soon as a competent man can be decided upon he will begin his work.

The Oatman Condensed Milk Company, of Dundee, Illinois, has decided to locate a condensery at Neillsville, Clark county, Wisconsin. The company has purchased the Neillsville Milling Company property and will remodel it and use it for condensing purposes. The plant will open about July 1st and will have a capacity of 50,000 pounds of milk at the start. About thirty men will be employed. The promoters of this new enterprise consider that the dairy business in Clark county is only about 30 per cent developed. They see room for many more [illegible] and are planning to use a product considerably in excess of that now supplied at Neillsville. This is another instance of the faith which large concerns have in the future of the dairy business in central Wisconsin.

The creamery at Brill, Barron county, was burned to the ground May 2d. The loss is partly covered by insurance. The plant will be rebuilt immediately. Meanwhile the Haugen creamery is taking care of the Brill patrons.

There is a proposal on foot in Langlade county to throw the county fair open, free of charge, to the public. A committee has reported that by appropriating $1,600 the county board can make a free fair possible and thus receive $2,500 state aid. The matter is now under consideration by the board which is favorably inclined to accept the proposal.

The Wisconsin Jersey Breeders' Association has decided to hold two summer meetings this year on succeeding days. The first meeting will be held at Waupaca on June 29th and the second meeting on the following day, June 30th, at Fewacres Farm, Wauwatosa. Two strong programs are being arranged and F. F. Showers, of Delavan, president, advises The Wisconsin Farmer that indications are that both meetings will be largely attended.

E. L. Liddle, secretary of the Western Wisconsin Holstein - Friesian Breeders' Association, advises The Wisconsin Farmer that the summer meeting will be held at the Indian School farm at Tomah on June 17th. C. P. Norgord, commissioner of agriculture, will speak. This association, organized eighteen months ago with nineteen members, now has a membership of fifty-four.

W. R. Stubbs, of Lawrence, Kan., who was one of the heavy buyers at the recent Holstein sales at Lake Mills and Watertown, is the former governor of Kansas. His recent purchase of thirty animals in Wisconsin brings his herd to seventy head, which he says is now headed by three of the finest bulls of that breed in America. Mr. Stubbs set out two years ago to prove that dairying in Kansas can be made profitable, and he is setting a fine example by looking to Wisconsin for his profit-paying stock.

R. A. Kolb, county agent in Taylor county, Wisconsin, is a real booster for annual cleaning up on the farm. He conducted a campaign to interest farmers in observing "clean-up" week this year and was very successful. In a signed statement to farmers he said that the housewife has her annual cleaning, but that too often that is as far as it goes on the farm.

LANDS AND HOMES

The Wheat Yield Tells the Story

of Western Canada's Rapid Progress

160 ACRE FARMS IN WESTERN CANADA FREE

The heavy crops in Western Canada have caused new records to be made in the handling of grains by railroads. For while the movement of these heavy shipments has been wonderfully rapid, the resources of the different roads, despite enlarged equipments and increased facilities, have been strained as never before, and previous records have thus been broken in all directions. The largest Canadian wheat shipments through New York ever known are reported for the period up to October 15th,

upwards of four and a quarter million bushels being exported in less than six weeks,

and this was but the overflow of shipments to Montreal, through which point shipments were much larger than to New York.

Yields as high as 60 bushels of wheat per acre are reported from all parts of the country; while yields of 45 bushels per acre are common.

Thousands of American farmers have taken part in this wonderful production. Land prices are still low and free homestead lands are easily secured in good localities, convenient to churches, schools, markets, railways, etc.

There is no war tax on land and no conscription.

ars Forty-pound List.

e Avan and New Hope Cow-Test- Association has just completed its nd month's work with fourteen on the forty-pound list. This is a gain of five cows over last month. This is not as many as the tester would like to see, but, considering that the farmers have not been paying much attention to the dairy business until just a few years ago, they are showing some good results. The report for the month ending May 10th follows:

Pepsin in Cheesemaking.

Due to reduced imports from Europe there is immediate danger of a shortage in the supply of rennet extracted for cheese factory use.

The stomach of the milk-fed calf yields rennet extract suitable for making all kinds of rennet cheese. A similar product called pepsin is obtained from the stomachs of other animals, including the pig and the sheep. This has been proposed as a substitute for rennet in the making of some, but not all, kinds of cheese.

Pepsin dissolved in water will curdle satisfactorily the ripened milk used for making American cheese, but not the sweet milk used for Swiss and Limburger, and, although few trials have been made, it probably cannot be used for brick cheese. However, if large quantities of pepsin can be supplied and used at American cheese factories there will be less difficulty in supplying rennet extract for making the other varieties of cheese for which sweet milk is used.

In past years a few trials of cheesemaking with pepsin instead of rennet have been made at the Wisconsin station, in Ohio and at Ontario, Canada. The published reports of these trials indicate that the pepsin cheese was about equal to rennet cheese in all respects. No special advantages were observed in the use of pepsin and the principal disadvantage was that the pepsin must be weighed out fresh daily and dissolved for use. Slight variations observed in the yield of cheese made with pepsin were probably due to variations in moisture content, which in most cases was not determined.

At the present time pepsin cheese is being made daily by the dairy department of the University of Wisconsin. The oldest is now less than two weeks old, but appears entirely satisfactory, according to the judgment of cheese experts and dealers who have examined them. There appears to be little danger of loss in attempting to make good marketable cheese with pepsin. Makers of American cheese are advised to procure four-ounce or larger samples of pepsin and give it a trial at their own factories at once before their supply of rennet is exhausted. Then they will be able to judge from their own observation as to the quality of cheese obtained with pepsin instead of rennet extract.

Quality of Wisconsin Butter.

To the Editor:—A large number of creameries in Wisconsin are making butter of high quality because a great deal of attention is being given the kind of cream received daily. It is not a question of cream grading alone, but good cream only at all times.

Some Wisconsin butter is not of high quality, but the time is not far distant when these factories will fall into line. The price the output of these factories should bring will be one of the deciding factors.

The April butter entered at the scoring exhibition conducted by the dairy department of the college of agriculture is not an indication of the average quality of the state's product. Ten per cent of the factories were represented and only a small number of exhibits came from the creameries that make good butter at all times. The primary object of the exhibition work is to aid the men who are not making high quality butter, but it is understood that anyone can have his butter scored.

It is to be regretted that a large number of the men who make good butter do not take part in the exhibitions. It should be remembered that to win national honors one must keep in trim by constant training. When some of the butter placed before the judges at each scoring is of high quality it furnishes material from which many valuable comparisons can be made.

In the Wisconsin April exhibition butter some 12 per cent of the entries were not made within the state. Some of these lots, as well as a few Wisconsin tubs, contained a flavor indicating that the cream had been treated before being made into butter. There are a few factories that do not realize the importance of receiving only such cream as will make good table butter. The farmer will produce and offer for sale good cream when the factory doors are closed against tainted product.

The dairy and food department has co-operated with several creameries in bringing about a better grade of raw material. Creamery operators and those in charge of cream buying stations should study the dairy laws that deal with the manufacture of food from unsanitary cream.

"No person shall by himself, his servant or agent, or as the agent of any other person, or as the servant or agent of any firm, or corporation, manufacture for sale any article of food for man from any unsanitary milk or from any unsanitary cream." (Section 4607b-6 of the state.)

Wisconsin factory operators and makers should also make a closer study of the license law, rules and regulations.

Every factory owner, operator and maker, together with all men interested in the future of Wisconsin's dairy industry should realize that tainted, off-flavored raw material will never make good butter. Good workmanship at the factory counts, but it is impossible to restore the original

Seeing the Difference
between the
DE LAVAL
and other
Cream Separators

THE difference between a modern De Laval and any other cream separator is apparent at first sight. And if you will take five minutes to compare the separating bowl construction, the size, material and finish of the working parts, particularly those subject to wear, the manner of oiling, and everything which enters into the design and construction of a separator as a simple durable machine, you will still further *see the difference.*

Then if you go a step farther and turn the cranks of the two machines side by side for fifteen minutes, running milk or water through the bowl, you will see still more difference.

And if you will run the two machines side by side in practical use, as any De Laval agent will be glad to have you do, the De Laval one day and the other machine the next, for a couple of weeks, you will see still greater difference in the work of the two machines.

Every De Laval agent considers it a privilege to show the difference between the De Laval and other separators and to afford every prospective buyer the opportunity to try out and prove the difference to his own satisfaction, if on first examination he feels the slightest doubt about it. If you don't know the nearest De Laval agent write to the nearest office as below.

flavor found in milk or cream if it is once destroyed.

The slogan for Wisconsin is "Pasteurized Butter a Safe Food." The improvement made in the quality of butter due to pasteurization is so slight that to the average consumer it is negative quantity, hence not a talking point. Factory men should not ask the question, "How much will it improve the quality to pasteurize the cream?" That is not the problem to be considered. In fact, it is not improvement in flavor of the butter that should be the question in connection with pasteurized butter. Pasteurization as applied to buttermaking from the consumer's viewpoint means more safe food. From this point of view the factory men of Wisconsin will listen to the plea for pasteurized butter.

Soiling For the Dairy Cow.

To the Editor:—Soiling is keeping animals away from pasture and bringing their feed green to them. Soiling is quite common in thickly settled districts, while it is almost unknown in sparcely settled districts.

This is because in thickly settled districts land is high and labor is generally cheap, while in thinly settled districts the land is cheaper and labor higher in price. In the thinly settled districts, therefore, the cheapest thing to do is to let the animals hunt their own food.

As fast as a country becomes settled it becomes more and more necessary to get all possible out of each piece of land. In the case of dairy cows soiling does this as compared to pasture. The chief reason is that the ground that produces the green food for cattle will produce a great deal more when it is not tramped than when it is tramped.

Every pressure of the cow's foot on the soil compacts it and reduces its power to produce food. Injury results both in dry weather and wet weather. In dry weather the soil particles are pressed together some, while in wet weather the feet of the animal break the thin sod and compact the soil below so that nothing will grow.

Sometimes a bare spot in the pasture will remain for several years unproductive. This, however, is avoided by soiling, and the land is made to produce its greatest possible crop of green feed for soiling.

But still there is another reason for soiling, and this is to save the manure from the cows, or other animals. When the manure is dropped on the pasture in dry weather much of it is destroyed before it gets into the soil. When the cows are kept in one place throughout the summer the manure produced during that time is as great as it is during the winter, and it is then put into the soil of the plowed fields, thus saving practically all of it.

There are other factors in favor of soiling where land is very high in price. One of these is that crops other than grass can be grown on the land, and a much greater amount of matter obtained than in the case of grass.

One of these plants, and a very valuable one, too, is corn, begin with the early sweet corn, which can be grown for soiling purposes far north of the latitude where it can be grown for the maturing of seed. Many who have tried soiling have been able to produce ten to fifteen tons per acre, for either green feeding or for silage making.

This makes it possible to keep on the same land more cows than can be kept where the cows are pastured in the summer and fed dry hay during the winter.

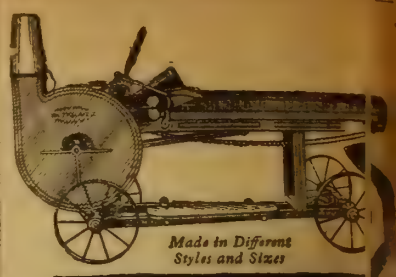
Soiling makes it possible for good sized herds of cows to be kept in the edges of cities where it would be impossible otherwise. In fact, it is one of the directions in which our dairying will be greatly developed in the future. We are bound to work toward the feeding of silage for winter and soiling for summer.

Subscriber.

Udder Development.

To the Editor:—Many owners of dairy cows do not place sufficient importance upon udder development in the cows that they keep and breed. The principle that like begets like has become one of the dominant factors in the handling of profitable milk producers. While we have known a few cows with apparently small udders that gave a good quantity of milk, we have also noticed that the majority of the same class will give a small quantity. An udder that hangs low is not to be coveted in a cow, as it does not add symmetry or beauty to the animal and too often its dangling motion when the cow is walking is an irritating influence. It cannot possibly give such good results as would an udder that reaches well to the front and rear.

When purchasing a cow always avoid one that has an inverted pyramid udder with teats that partake of the conical outline. A cow of that order is not a choice animal to milk and seldom gives good results at the pail. We have known dairymen to select one or two cows that had fine udders and teats for the purpose of building up a herd of the same order, but unless the dams have an ancestry well developed in this particular such a method is very much like a leap in the dark. Of course, a bull will influence this feature greatly, but as this function is not after his type the dam



The Old Standby

Every farmer who has used a EAGLE Ensilage Cutter knows its absolute reliability. When you cut corn or other silage feed is ready for the silo, you want quick service with safe, reliable, large capacity silo filler. Experience shows that the EAGLE is a compact, safe, well built, clean cutting machine of extra large cutting capacity and reliable self-feed.

EAGLE Ensilage Cutter

are simple, durable, light running machines. The deep-grooved and non-wearing spike rolls give far greater feeding possibilities than any other cutter. The reverse lever permits instant stopping and reversing. They are machines with easy running, durable, positive-driven blowers that will not clog. *Get catalog at once showing other special features.*

If none of the above combinations suit you, you can make up your own club of papers in the following way: First select The Wisconsin Farmer and figure it at $1.00 per year. Then select any of the papers or magazines listed above and figure them at half their regular subscription price as indicated above, choosing whatever papers or magazines that appeal to you. As an example, suppose you should want The Wisconsin Farmer, Kansas City Weekly Star, Woman's World and People's Home Journal. You would figure The Wisconsin Farmer in the combination at $1.00; then you would add the regular subscription price of the other three papers, which amounts to $1. Half of that amount equals 55 cents. Add this to the regular price of The Wisconsin Farmer, which is $1.00, and you would have a total of $1. which would be the rate for The Wisconsin Farmer, Kansas City Weekly Star, Woman's World and People's Home Journal.

If you wish to subscribe for any papers or magazines not listed in the above offers, write to us for special rates. Send all orders to Club Dept. The Wisconsin Farmer, Madison, Wis.

must be the greater factor to reproduce this development and to her and her ancestry she owes so much that pedigree has a large preparatory influence upon the unborn heifer.

There is so much real satisfaction in the milking and handling of cows that have good udders and good teats that it seems very strange that dairymen have so neglected this important feature of their herds, and by their seeming neglect far too many cows have small udders and consequently small, short teats. It will nearly always be noticed that cows with small udders, even in the best dairy breeds, usually carry too much flesh and lack that double wedge shape which is so desirable in the eyes of a modern dairyman. This is, of course, only one of the many points relating to the mating and breeding of good milk producers. W. H. U.

Reasons For Raising Baby Beef.

There have been some big changes in the beef-producing business in recent years.

In the early days large droves of steers, four, five and six years old, weighing in the neighborhood of a ton, were sent to market. You can likely remember when your father sold steers weighing 1,700 or 1,800 pounds. Those were the days of cheap grass and cheap corn. Visit the Chicago stockyards today and watch the cattle being driven over the scales you won't see many of the big fellows. You would see steers weighing 1,400 to 1,500 pounds—about the size of a good beef cow. Now I am speaking of the best class of beef cattle, those that we call "finished" or "prime" and commonly spoken of as "hog fat."

Stay at the yards long enough and you will see some steers that are smaller and still look to you to be just as "prime" as the big ones. You will hear the men around the pens say, "That's a fine bunch of yearlings."

See how things have changed? Fifty years ago a heavy steer must weigh a ton. Fifteen or twenty years ago a 1,700 or 1,800-pound steer was classed as heavy and today anything weighing over 1,400 pounds is called a heavy steer. What has caused this change?

All have bought meat at the butcher shop and you know that some pieces are cheaper. For instance, pot roast does not cost as much as round steak. Because meat has become so high priced in the past few years people who buy the expensive cuts feel that they cannot afford to buy large pieces. Now the only way to have small cuts and not destroy their shape is to cut them from smaller animals and so butchers like to buy baby beef. This class of animals furnish just as good or better meat than older cattle. Buyers will always pay top price for baby beef and will often pay more for it than for older cattle just as fat.

Younger animals get more out of their food than older ones. The digestive system—stomach and intestines—of a baby beef makes more and better use of feed than that of a three or four-year-old steer. Cattle feeders have proved that they could make cheaper gains on young cattle and we always want to do a thing the cheapest way providing we get as good results. That means dollars and cents to us and a "penny saved is a penny earned." Put the most meat on your steer at the lowest cost.

Two or three-year-old fat heifers will not bring as much money as a fat steer the same age. This is because older heifers very often carry calves. If they do their meat is too red and they don't "dress out" well. The packers know by experience about what per cent of heifers are in this condition and they make their prices accordingly. However, they will pay just as much for heifers as for steers in the baby beef class.

There has been another important change in beef production. Years ago cattlemen in this section of the country used to breed and grow their own beef, carry it until it was four, five or six years old and fatten it. But as land and corn increased in price they found that the ranchers in the West could grow an animal to two or three years of age cheaper than they could. So when the western man marketed his cattle they would go down to Chicago, buy these "feeders," as they are called, take them to their farms and "finish" or fatten them. And they made good profits because feeders were cheap and plentiful. But today they are scarce and high priced and the cattleman finds that he can grow his cattle as cheaply as he can buy them. That's why many men are quitting cattle feeding.

Now the American people are the biggest meat eaters in the world and they eat more beef than anything else. If the cattle feeder is quitting the game where are we to get beef? It will have to be bred, grown and fattened right on the farm, exactly like pork is produced. And now I come to the point I have been aiming at. Baby beef production takes the least money. Instead of having your money tied up in a breeding herd, calves, yearlings, two and three year olds and sometimes four and five year olds like grandad did, you have your money invested in cows and calves only. That means less interest and less risk. It means that you can turn your money quickly; it means that you will have more money to buy cows and a better bull and to help fix up the old farm a little. These things are important rules of good business and all successful stockmen are hard-headed business men.—[J. C. Robinson, Rock county, Wisconsin.

Shearing Time Is Here.

To the Editor:—Many flock owners will find a shearing machine has its advantages over the hand shear. With the machine the work is done faster and the sheep do not receive as many cuts if the shearer is at all careful, More wool is taken from the sheep and the fleece is taken off more evenly, which gives the flock a better and smoother appearance throughout the year.

A shearer should be able to remove the fleece from a sheep in one piece hanging together like an overcoat. Then it should be spread out on a clean table or boards, flesh side down, and all dirty locks or filthy parts, if any, discarded. The belly and neck pieces should now be turned in first, then both sides and then the whole rolled into a nice square bundle and tied with the new kind of twine (paper twine). Two strings crosswise are sufficient. If a little care is exercised in tying the fleece to get all of the flesh side on the outside attractive bundles can be made, making the wool clip salable at a higher price. It is of great importance that no other kind of twine than that made of paper be used for tying wool, as manufacturers of woolen goods object seriously to the use of any other and will pay less per pound for it, as it causes an extra expense for labor in picking out sisal from the wool which mix up with the fibers and do not take dye. This is prevented by the use of the smooth paper twine and consequently the manufacturer is willing to pay more for the wool if he can save the labor involved in picking out the sisal strands or in removing manure or filth from the fleece. Frank Kleinheinz.

The cheese industry of Outagamie county amounted to approximately a million dollars last year, according to John A. Brill, secretary of the Appleton board. He estimates that about a fifth of the cheese made in the county was sold on the Appleton board, the amount passing on the board being $193,878 during the last fiscal year.

FOR sale, slightly used Kimball upright piano, beautiful case, in perfect condition, used about year, $150 cash. Flora Pfingston, care this paper.

Get all your Cows Earn

Every milch cow in your herd earned a nice profit for you that your separator *failed to deliver.* Where did the money go? Let us show you.

Every separator (except the New Sharples) loses cream if not turned at the exact speed marked on its crank. Experiment Stations and independent researches have brought out the surprising fact that 19 out of every 20 separator users turn their machines under speed and thus lose $2.40 to $12 per cow per year. (See Purdue Bulletin No. 116).

The New Sharples skims clean whether turned *fast* or *slow.* It will get you this extra profit your cows make for you, but which your fixed-feed Separator throws away.

THE NEW SHARPLES SUCTION-FEED

Separator feeds the milk into the bowl in exact proportion to the separating force. At 45 revolutions it skims clean; at 55 revolutions it skims clean; and at 35 revolutions it skims equally clean and always with *even quality cream.* No other separator has these two valuable features—*clean skimming* and *unchanging density of cream at varying speeds.*

The Suction-feed Separator has other important advantages. The hollow tubular bowl is easy to clean and easy to handle. There are no discs to wash. The oiling is automatic; no oil-caps or oil-holes; no dripping or mussing of oil; no oil waste. The top of the large supply-can is only two feet from the floor—a great convenience in filling.

Easily and quickly oiled. Once a month is sufficient.

These are some of the reasons why you should have a New Sharples and *get all the cream money all the time.*

Read the full story in our new book, *"Velvet" for Dairymen* which also explains our free trial plan. We will gladly send you a copy. Ask for it—*now.* Address Dept. 44.

HOW UNUSED STUMP LAND MAY BE

A Glimpse of Upper Wisconsin Land When the Lumberman Has Finished His Work. The Same Land After Modern Land Clearing

FOR many years the efforts of the Wisconsin agricultural authorities have been directed chiefly toward the end of greater production. A few months ago Dean H. L. Russell conceived the idea that the Wisconsin College of Agriculture had completely overlooked a very important matter. He reasoned that considerable ammunition was being wasted in preaching better live stock, pedigreed grains, alfalfa, etc., to farmers whose land was largely covered by stumps and brush. This reasoning was father to the idea of a "Land Clearing Special," which at this time is sweeping across the northern counties of Wisconsin. Under the

BIG STUMPS WITH DEEP ROOTS REMOVED WITH MODERN STUMP PULLER.

personal direction of Mr. Carl Livingston a most unique series of demonstrations is being held. For the first time, Wisconsin settlers will be treated to a practical demonstration of land clearing. The agencies which are being used are stump pullers and dynamite. The first demonstration was held at the village of Mountain, Oconto county, May 8th and 9th. Mr. B. H. Rohan had charge of the local arrangements for this demonstration. About three hundred fifty farmers, every one of them with a land-clearing problem on his hands, were given a practical demonstration of the best methods by which unproductive stumpage may be transformed into profitable acres. The land-clearing special stopped May 11th, 12th, 13th and 15th in Langlade county. The Langlade county arrangements were in charge of Mr. Frank G. Swoboda, of Antigo, county agricultural representative. One demonstration was given in a ten-acre field of stumps a mile east of Antigo, and the other in a field near the village of Elcho. Continuing its course, the land-clearing schedule called

A FINE ORCHARD STARTEDWHEN THE WORST OF THE STUMPS WERE REMOVED.

for demonstrations at Crandon, May 16th, 17th and 18th; Three Lakes, May 19th and 20th; Eagle River, May 22d and 23d; Woodruff, May 25th and 26th; Mayfield, May 29th and 30th; Mason, May 31st and June 1st; Phipps, June 2d and 3d; Bennett, June 5th and 6th; Spooner, June 7th and 8th; Baronett, June 9th and 10th; Rice Lake, June 12th and 13th; Radisson, June 14th and 15th, and Cornell, June 16th and 17th. The local representatives in charge at the stations named are respectively as follows: John Swenehart, Jr., Forest county representative; W. D. Juday, Oneida county representative; Oscar Gunderson, Vilas county representative (for both Eagle River and Woodruf); A. H. Wilkinson, C. H. Worden, C. P. West, Sawyer county representative; J. M. Walz, Douglas county representative; E. M. Elliott, R. L. Cuff, Barron county representative (for both Baronett and Rice Lake); C. P. West, Sawyer county representative, and A. L. Fox.

It would seem that land-clearing methods should have received much more attention long since in upper Wisconsin. The purpose of the series of demonstrations now arranged is to prove to farmers and settlers that land can be cleared at a small cost by use of both dynamite and mechanical power. The mechanical apparatus used in the demonstrations included several makes of stump pullers. There was one outfit which used man power only. The others used horse power. Mr. Livingston explained that there might have been added to this a demonstration of the use of steam and gasoline power. In quite a few localities the tractor has been used to good advantage in stump pulling. Gasoline power has also been found very useful for clearing the land after the stumps have been pulled. A great many very interesting facts and opinions were developed by the demonstrations. The representatives of the manufacturers took time to answer questions. Occasionally there was found a farmer who felt that the state was going to considerable expense to demonstrate the value of manufacturers' products. This thought was due entirely to a misunderstanding and a misconception of the plan of the campaign. As a matter of fact, the state paid practically nothing towards the expenses of the "Land Clearing Special." The

THE CAPSTAN STUMP PULLER WITH HORSE POWER SHOWING ANCHOR STUMP.

use of the machinery was donated by the manufacturers. The dynamite and powder used was donated by one of the large powder concerns. The demonstrators paid their own expenses. The advertising was done by the local committees, with some assistance from the College of Agriculture. The expense of transportation was met entirely by the railroads. Beginning at Mountain, the trip was made over the Chicago & Northwestern railroad to Bayfield. The balance of the trip was made over the Chicago, St. Paul, Minneapolis & Omaha railroad, a part of the Northwestern Lines. Mr. Ford J. Allen, representative of the Northwestern Lines, assisted in making the arrangements and accompanied the special several days.

The Wisconsin Farmer has repeatedly called attention to the fact that there are something like ten million acres of undeveloped land in upper Wisconsin. This land, when cleared, becomes a rich, rolling prairie, well drained, and adapted to general farm and garden crops. It is surprising how little is really known about land clearing. The United States Department of Agriculture has made a careful survey of upper Wisconsin and has announced that about 7,500,000 acres of uncleared land is suitable for farming. The College of Agriculture has issued bulletins on clearing. But the matter of the cost of clearing has been largely guesswork. Overenthusiastic land traders have placed the cost of clearing at a very low figure. Settlers who have attempted to clear lands by improper methods have given very discouraging reports as to the expense. Of course, conditions enter largely into the expense. One trouble with land clearing in upper Wisconsin has been that there was so little good equipment with which to work. We were surprised to find several counties where not more than two or three stump pullers had ever been used.

Many costly mistakes have been made in clearing. A good many farmers have attempted, to their sorrow, to pull green stumps. They have found dynamiting such stumps expensive. They have found that in some soils dynamite has brought to the surface

Most Stumps which have been

VITH DYNAMITE. THIS LECTRICITY.

standing five or six years, or longer, are, of course, much easier to pull, either by the straight upward or side pull, than the green stumps. Any method of removing stumps, outside of the use of dynamite, brings up a large amount of earth attached to the roots. The weight of earth is often as much as one ton and sometimes two or three tons. One of the demonstrators at the recent clearing show has adopted the plan of pulling with a stump puller and then inserting a charge of powder in the center of the stump so as to jar loose the dirt which has come up with the roots. This was found to work very well except in some instances where the dirt raised was a hard clay. In any light soil this method is very practical. Any discussion for the purpose of determining absolutely the best and cheapest method of clearing land under all circumstances would be futile. Everything depends on the age and character of the stumps and the condition of the soil. A charge of dynamite which would easily lift a certain kind of stump in a certain kind of soil might fail under other conditions. To clear land to the best advantage one should understand the character of the stumps and of the soil. The size of a stump does not necessarily determine whether it can be most easily pulled out of the ground. At one of the demonstrations a large hemlock was used for an anchor stump. The top of the hemlock had evidently been cut seven or eight years. It was a hardy, healthy looking stump, however, from outside appearances. The stump which was to be pulled was a small hard maple which had been cut about a year and a half ago. It was not surprising to the old settlers to see the little twelve-inch hard maple stand firm as a rock while the big thirty-inch hemlock anchor stump was pulled out. The small hard maple stump proved to be one of the hardest propositions on the field. Before it could be pulled with the stump puller which was being used on it, it was necessary to split the

SETTLERS SHOW GREAT INTEREST IN MODERN STUMP PULLING METHODS.

stump with a charge of powder. The demonstrator who had charge of the work with explosives accomplished this very easily and the stump was then pulled out, in two sections. While the ordinary method is to pull out stumps with a chain or cable it was found advisable frequently to use the steel stump hooks. These have the appearance of a clawhammer, only many times as large. The claw hook weighs about 100 to 150 pounds. It is a very useful tool in stump-pulling operations.

"Safety First" was the motto adopted during the demonstrations, as applied to the use of dynamite. Many who have never used explosives have an idea that dynamite is exploded like a firecracker —a fuse stuck into the stick. Such a method would probably only burn the cartridge. Blasting caps or detonators are used, and these are sensitive to shock, friction or heat and should be handled with great care. A cap box has been designed by the College of Agriculture. It is a foolish habit to keep blasting caps loose in the pocket. During the demonstration a small electric storage battery was used to explode the charges. Such a field battery is inexpensive and almost invaluable if any considerable amount of dynamiting is to be done.

Demonstrations as they have been conducted thus far prove conclusively that land can be cleared at a reasonable expense with stump pullers or dynamite and, further, that these two methods work well when combined. There are a great many stumps which can be taken out more economically with the use of powder or dynamite as a help, than could be pulled without the use of explosives. There are a great many instances where explosives are not necessary and where the stump puller can accomplish the work with ease.

The gist of the whole matter is that there are not nearly enough stump pullers in upper Wisconsin and not nearly so much explosives used as there should be. We have no doubt the campaign carried on by the manufacturers will result in great benefit to them. In every one of the twenty or more counties visited by the land-clearing special, interest has been aroused in these modern methods of clearing land. We were advised by some of the county agents that they have repeated calls for further information, both as to stump pullers and the use of explosives. Doubtless there will be many settlers who will approve one method and others who will approve another. It has been quite satisfactorily demonstrated that the big land-clearing projects, such as the one attempted recently by the Soo Line, have not been very satisfactory to the settler with a small tract. In the main it seems to be better for the clearing to be done in small jobs. The cost of an outfit such as some of the

A GOOD TEAM AND MEN WHO KNOW STUMPS FACILITATE LAND CLEARING.

railroad companies have undertaken to use runs up into several thousand dollars. It is necessary to have eight or ten men to operate it. It clears land rapidly but not so economically as might be supposed. Furthermore, it leaves a great amount of work to be done afterward by the settler. Mr. Livingston made the statement on one of his demonstrations that his investigations up to this time indicate to him that the good, clean job of clearing is most likely to be accomplished with the small outfit. It is not necessary for every settler to have a stump-pulling outfit, but it seems to be best for him to have a part in the work of clearing so that he may see that it is done well. We have no doubt many settlers will secure stump-pulling

SPLITTING A STUMP WITH POWDER SO THAT IT CAN BE HANDLED BY THE STUMP PULLER.

outfits and use them on their own farms and also on the farms of their neighbors. Others will make a more careful study of the use of explosives for the clearing of their own land and will also

FARM MECHANICS

Auto, Farm Engine and Farm Machinery Ailments diagnosed and remedies suggested in this department

QUESTIONS AND ANSWERS.

Batteries Wear Out.

Would you please advise me as to my gasoline engine? When I use it one day steadily it wears out a new set of dry cells.

Answer.—Either the contact points of the engine timer remain in contact too long or there is a short circuit in the wiring between the switch and the engine or a ground or short circuit at the timer. See that the contact points close only an instant. See that the insulation is good on all your wires and that no bare ends of the wires are sticking out from under the binding post nuts. Examine the timer and see that the parts are clean and that the insulation is good.

Cementing Canvas.

I would like to know what kind of cement I could use to cement canvas together and to cement canvas to rubber. I am putting one auto tire on top of another and I would like to get some kind of cement to stick them.

Answer.—Liquid glue may be used to cement canvas to canvas, the canvas being clamped together in a press while drying. For your purpose it would be better to use uncured rubber and rubber cement, washing the cemented sides of the canvas with the cement, placing a sheet of the uncured rubber between them, clamp them together in a vulcanizer and vulcanize them. You will not be able to do a very good job without a vulcanizing outfit.

Using Kerosene.

Owing to the increase in the price of gasoline, I would like to know if it would be injurious to a one-horsepower gasoline engine to use kerosene as fuel. My engine will run on kerosene after running a few minutes on gasoline, but it smokes badly. Do I need a different mixing chamber? Or could I run the feed pipe from the kerosene tank around the cylinder or exhaust pipe and then to the carburetor?

Answer.—Many engines will run on kerosene after they become hot. Kerosene should be used with caution. The smoking is a sure indication that the kerosene is not burning as it should and carbon troubles are sure to follow. The oil in the crank case must also be watched, as the unburned kerosene may work down into the oil, thinning it and making it unfit to lubricate. To aid the carburetion of the kerosene use a brass or copper feed pipe, wrapping it around the exhaust pipe four or five times as near as possible to the mixing valve or carburetor. Run a hot air pipe from the mixing valve or carburetor to a hood around the exhaust pipe or cylinder.

Steam Valve Setting.

I would like to know what is the matter with my engine. It takes so much wood and water. It is a Port Huron make, sixteen horse power, with piston valve.

Answer.—The valve may be worn so that it leaks badly or it may not be set properly. The piston may need new rings. It may be that the cylinder is also worn so that it should be rebored. The following instructions for setting a Port Huron piston valve are given by the makers:

Be sure to have the crank on dead center. Set the eccentric on the shaft opposite the crank pin. If the eccentric or shaft have not been replaced by others since leaving the factory holes will be found in the shaft for set screw points.
